"Do you remember those old cashmere dresses of mine—blue and garnet? I was up in the garret the other day looking over old clothing, and I found that there was enough good stuff in those dresses to make me two morning sacks. I shall box-pleat and belt in one, and the other will be tight-fitting in the back, with a loose front drawn in with ribbons which start from the under-arm seams, and tie in front in a bow. I shall use black ribbon because I have it, and the same good reason has decided me to have collar and cuffs of black velvet."

"YES, I am tired of wearing white skirts, or rather I am tired of the washing and ironing of them, and so I am going to wear a black satine skirt with my dark frocks. I saw recently some very nice ones in the city. They were embroidered in white and warranted not 'to run,' and were marked, I think, $1.25."

HELPS.

A LITTLE ICE-CREAM.

ICE CREAM is often the best food to take in certain fevered conditions, and a simple method for making it when only a pint is wanted is the old-fashioned one of placing a tin bucket inside a larger one of either tin or wood and packing the salted ice between them. The modern improvement applied to this way is to use an egg beater to stir the cream. When it is thoroughly beaten it will freeze with a fine grain, and very quickly, the quantity of cream being so small.

OLD COLLARS.

SIX collars with frayed edges stared up from my collar-box and not one of them was worn out except on the edges, but I dropped them in a heap into the rag-bag and went to buy a new one. I did not think I could afford more than one just then. The saleswoman showed me several different styles and among them one with a binding of marseilles on the edge, and as it looked strong and serviceable I chose that one and carried it home. Getting there in time to examine it closely, I decided that such a strip of marseilles might easily be put on my discarded collars, so they were rescued from the rag-bag and 10 cents' worth of ribbed marseilles made them all over new and enriched me very greatly.

A COLORED SKIRT.

Jennie Lane bought six-and-one-half yards of skirting and carried it home last week. She used five yards in making a long, plain skirt and reserved the rest to renew it around the bottom when it is worn off. The skirt is intended for every-day service, and as a substitute for a white skirt with all but very light dresses.

FOR A WASH-STAND.

Coarse, unbleached muslin can be made into a neat cover for a wash-stand by decorating it with a border of drawn work and figures worked in dark-yellow embroidering wash cotton. The heavy muslin fringes very nicely too. Such a cover is pretty and inexpensive, and can be washed an unlimited number of times. It should not be starched, for if stiff it will not hang gracefully about the corners of the stand.

BAKED APPLES.

Mrs. Brown has lately served the apples for supper in a new style that has proved very popular in her family. The apples are pared, quartered, cored and sweetened, and a little water is added and they are baked until tender in a baking-dish; then the whites of two or three eggs well beaten are poured over them and they are set in the oven until the eggs are of a light-brown color. Eaten cold, with or without cream, they are delicious.

A FASCINATING TOY.

Mr. McDonald at a sale bought an old clock for a few cents and gave it to his little son for a plaything, and the hours of absorbing pleasure the little fellow spent over it could hardly have been afforded by any ordinary toy. It must have been an instructive amusement too.

DARNING-COTTON MITTS.

Mitts knit of white darning cotton are a great protection to the hands in winter and are easily washed and kept clean. They can be worn while making beds or hanging clothes. They save the hands in sweeping and churning, or in carrying fuel—either coal or wood. When the work is finished, if they are washed and hung by the fire to dry, they will be ready for the next day's service. They can be kept cleaner than woolen mitts and will wear longer.

OLD CLOTHES

Winter days grow long enough in February to allow some time for examining the family stock of clothing, and for putting in order or making over all that is still useful. Then the useless garments can be cut into carpet-rags or sold for paper rags, and the spring cleaning will be easier if the closets are all relieved of their unnecessary burdens.

NEW CLOTHES.

A great deal of the year's sewing can be done in the winter in many families, and a good seamstress employed for a week or two at this season, will enable a housewife to borrow some of the burdens from the load that spring and summer always bring, and lay them on the less burdened back of winter. The virtuous woman described by Solomon is praised for her care in clothing her household, and she did not defer her sewing until the need for it was pressing, for we are told, "She is not afraid of the snow for her household, for all her household are clothed in scarlet," and the same kind of forethought will provide thin garments for the summer heat, and medium clothing for the spring.

A. B.

AN EXCELLENT KALSOMINE.

AS it is nearing the season of spring cleaning, I will give my formula for kalsomine which I have never seen excelled.

Seven pounds of zinc-white, one half pound of white glue, and water to make of the consistency of thin cream. Cover the glue with cold water; when soft, turn off and cover with boiling water. Stir until dissolved, add water and zinc-white. A small quantity of ultramarine blue added to the mixture improves it for my eyes. MRS. ECOMONY.

WORTH KNOWING.

IN buying whale-bones for a waist, select those that are flexible rather than those that are stiff. The former bend to the shape, yet hold the waist in position. If a bone becomes very much bent, do not throw it away as useless, but hold it close to the fire or lamp chimney, and the heat will straighten it out as good as new. I find it best to buy bone by the yard and cut it in lengths to suit. You can buy casing or covering for them at five cents per yard. It is double so that the bone can be slipped down the center. The metal "bones" are very good when put in at first, but they are very apt to break and then the jagged ends pick holes in the dress material.

PURPLE violets are the latest craze in millinery. Two-thirds of the women one meets have a cluster of them somewhere, on hat, at throat, or pinned to the muff.

D. H. V.

Now is the best and cheapest time of the year to buy white goods—towels, bedding, table linen, etc.

THE back breadths of the overskirt are no longer looped. Gather or lay the goods in pleats.

IT is prophesied that black lace dresses are to be as popular the coming season as they were last. Chantilly lace will be used.

IN dress goods, spring woolens show stripes both wide and narrow. The large plaids shown are said to be for children's and misses' wear.

WHITE and gold furniture is as popular as ever and to this fad we may now add that for white fur rugs. These rugs serve not only for floor coverings but for covering lounges and easy chairs as well.

HARPER'S BAZAR says that wash dresses for large girls are made with high belted waists with a yoke or with the shoulders quite plain, or else gathered there on a band like the full Russian blouse. The sleeves are full and these are turned over cuffs and collar or else pleated frills form the finish for neck and wrists.

Miscellaneous Advertising.

For Women

Of delicate constitution, no better medicine can be recommended than

AYER'S Sarsaparilla.

It is highly concentrated, economical, safe, and pleasant to to take.

"This is to certify that after having been sick for twelve years with kidney disease and general debility, and having been treated by several physicians without relief, I am now better in every respect, and think I am nearly well, having taken seven bottles of Ayer's Sarsaparilla."—Maria Ludwigson, Albert Lea, Minnesota.

Ayer's Sarsaparilla,

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass.

Price, $1; six, $5. Worth $5 a bottle.

DEDERICK'S HAY & COTTON PRESSES,
are sent anywhere on trial to operate against all other Presses, the customer keeping the one that suits best. No one has ever dared show up any other Press, as Dederick's Press is known to be beyond competition, and will bale with twice the rapidity of any other. The only way inferior machines can be sold is to deceive the inexperienced by ridiculously false statements, and thus sell without sight or seeing, and swindle the purchaser. Working any other Press alongside of Dederick's always sells the purchaser a Dederick Press, and all know it too well to show up. Address for circular and location of Western and Southern storehouses and Agents.

P. K. DEDERICK & CO., Albany, N.Y.

THE COOLEY CREAMER

AGAIN PROVES ITS

SUPERIORITY OVER EVERY OTHER APPARATUS

AS A CREAM RAISER AND SEPARATOR.

The **ANALYSIS** of the **SKIMMED MILK** at the test at the Granite State Dairymen's Association's Annual Meeting at Hanover, N. H., Jan. 8th, 9th, and 10th, shows that the **COOLEY CREAMER** got the cream from the milk the most thoroughly, the next nearest competitor had 12¼ per cent. more butter fat left in the skimmed milk. The **CENTRIFUGAL SEPARATOR** had 32½ per cent. more butter fat left in the skimmed milk, proving conclusively that the **COOLEY CREAMER** is the best **Cream Raiser** or **Separator.**

This agrees with test made by the committee at Amherst, Mass. Creamery in Oct., 1882, when the skimmed milk from the **COOLEY CREAMER** analyzed by **Prof. Goessman** of MASS. AGRICULTURAL COLLEGE showed that the **COOLEY SUBMERGED CREAMER** was the best **Cream Raiser** or **Separator.**

Also with **Prof. Short,** of WISCONSIN AGRICULTURAL COLLEGE, who tells the Farmers of his state: **"Submerged setting of milk is preferable to any other system;** if the milk is submerged promptly as soon as drawn from the cow, and the water kept cold, it produces more cream than by any other process, and prevents contamination by any impurities in the atmosphere."

THE ABOVE CONFIRM ALL PUBLIC TESTS.

The **COOLEY CREAMER** always shows that it extracts the cream from the milk **more thoroughly** than any other apparatus, and consequently makes the most butter. SEND FOR CIRCULARS GIVING FULL PARTICULARS.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

I HARDLY know what the company would have done, had not Hank Jacobs, at that crisis, pushed his way unsteadily through the door. He carried his violin under his arm, and felt his way along the side of the room towards an empty seat in the corner. When he had safely deposited himself in the chair, he caught up his fiddle under his chin, and called, in a decidedly thick and uncertain tone, "Git partners fer a two-by-four."

Hank was strict business to the last. No doubt some one had told him about the minister's visit, and he had roused himself by a supreme effort, for he did not desire to see the laurels he had so deservedly won, pass from his own head to Mr. Grayling's.

The coming of the new musician gave the minister a good opportunity to resign his position as violin soloist. Jim Foster invited the little man to stay and enjoy the dance, and even offered as a special inducement to dance with the minister himself.

The Rev. Mr. Grayling declined the great honor with thanks. He carefully wrapped his garments about the violin, and then with a grave bow to the company, he groped his way through the dimly lighted store, out into the pleasant moonlight, glad that his promise had been fulfilled. He walked slowly down the desolate streets towards Mrs. McKelvey's house.

He had come to this lonely place, to "build up a church," and it seemed a hopeless task He knew well that he never could succeed. How grimly the houses frowned upon him! Brooding there in their loneliness, they had no sympathy to offer him. But the moon smiled down upon him as it climbed higher and higher over the pines. It seemed anxious to cheer him, for it cast a flood of light far ahead down the street to Mrs. McKelvey's door. The windows of the old "Continental Hotel" flashed back the light with something of their old fire.

But the minister did not seem to care for the kindly sympathy. He walked slowly on with his head thrust forward, and muttered half to himself as he went "Perhaps I shall find it here; perhaps this is the last. I do not care, I think I am ready."

The company at Cobb's was not sorry to see the minister go. He was decidedly out of place at a dance, for there was something about him that filled them with awe.

As Jim Foster, in the capacity of manager, placed the minister's chair back to the side, he saw two pieces of paper lying on the floor. They had evidently fallen from Mr. Grayling's pocket, and were further specimens of his verses.

Jim picked up the little pieces of paper and glanced over them. "Boys," he cried, "here's some verses Parson has writ."

"Line 'em off," urged Bill Gammon, thinking no doubt that it might run to the tune of one of his three masterpieces.

Jim solemnly spelled out the verses, while the rest listened. The first was an extract from Enoch Arden; but the audience did not recognize it as a quotation. They gave the minister full credit for it.

"No gladlier does the stranded wreck
See through the gray skirts of a lifted squall
The boat that bears the hope of life approach
To save the life despaired of, than he saw
Death dawning on him, and the close of all."

This was evidently the worst that the company had yet seen. Bill Gammon gave it up. When Jim first started, it seemed as if the verse would run to the tune of "The Little Widder Dunn," but after a careful trial, Bill found something wrong in the combination. The next selection was evidently original:

As one who gazing on the ocean's breast,
Where the gray boulders butt the angry sea,
Feels in his heart a vague, a strange unrest
To think how mean and poor his life must be:
Yet sees the sun die o'er the distant bay
With a new splendor kindling all the sky—
Sees some poor spar that men have thrown away,
Hold up a life the world would not have die;
Knows that some better life through his may flow,
As mountain flowers grow upward through the snow.

The other piece of paper had evidently been torn from a long poem. There were only a few lines on it. Perhaps it was just as well for the company:

"When in his life some blighting shadow falls,
Some cruel care that will not take its hand
From off his heart—why should he care to live?
There is one hope alone—he yet may know
The mighty secret men must die to win."

At the conclusion of this reading, Jim looked at his audience. The boys were unable to express their feelings.

Jim danced the first set with Jeff Price. While the "sides" were going through the first figure, Jeff remarked confidentially "I've ben backin' this yer Snooks heavy fer a fool, but after them verses been read, I'm go'nter change my vote an gin it ter Parson."

The Easter sun came climbing over the trees in good season. It stopped for a moment at "St. Paul's Church," as if to give that ruin a word of friendly greeting. Then as if to make up for lost time, it flashed over Drum Lake, and darted a long golden wedge into the Rev. Mr. Grayling's room.

But if the sun expected to catch the minister napping, it was sadly mistaken, for he had been up ever since the first streak of dawn, and had already built a fire in his "audience room." The sun had better luck with Mr. McKelvey. A stray beam that forced its way in through the window, fell directly upon his face, and caught him with his mouth open in a most suspicious manner.

The sun was bound to find the minister, however. It crept in through the patched windows of the old dance hall, and found the little man at last kneeling in front of the altar. Strange to say, the sun did not seem to have the least reverence for the minister, and it went dancing and sparkling over the clean, white surplice and played along the letters of the motto on the wall. At last it settled down somewhat, and nestled comfortably in the green bower that had been built for the choir.

The Rev. Mr. Grayling remained up stairs until the call for breakfast Then he walked, slowly and carefully down stairs, and took his place at the table.

The McKelveys had "turned themselves loose," as Jack Gray said, over the Easter breakfast, for such a meal had hardly ever been seen in Drum Lake.

The boarders were so interested in the discussion of the meal that they had little time to plague the Parson. He ate but little, and after timidly announcing his Easter sermon and inviting all the boarders to attend, he went up stairs again. The boarders did not notice his departure. When such a breakfast was placed on the table, who could conscientiously ask them to think of anything else?

Various.

"Farmin' Don't Pay."

A CARTOON CRITICISED.

PARROT PAINFULLY POUNDED.

VARIOUS VIEWS.

FROM OHIO.

The "Parrot" came to the front in the RURAL of February 27, and on first view it has the best of the argument that "Farmin' don't pay." The "Parrot" would still get its work in more effectually if that cartoon were lithographed, framed and hung up in the dining-room of every farmer's home in the land, and also in some conspicuous place at each agricultural college, where they are endeavoring to educate boys so that they will return to the farm. Even if it be true that the farmer is borne down by an unjust share of taxation; even if it be true that he is compelled to pay a higher rate per cent. for the use of borrowed capital than other men do, I would yet question whether the farmer's position in society can be elevated, or his material and pecuniary welfare improved by such pictures.

But is it true that the farmer pays an unfair share of the taxes levied for the support of the State government? Here, in Ohio, a re-valuation of the real estate for taxable purposes is required at the beginning of each decade, the practical result of which is—at least in this part of the State—that our farms are listed on the tax duplicate at, on an average, about one-half their actual value or selling price. Owing to the prevailing low prices of agricultural products during the last four years, our farms have decreased in real value, and as a result we are now paying a disproportionate share of the taxes as compared with the owners of real estate in the towns and cities. Perhaps in no other period in the history of our State has this anomalous condition of affairs occurred, and this, it is confidently expected, will be corrected at the ensuing re-valuation of the real estate next year. Now, will it be said that this depreciation of farm values—or in other words over-production—has been brought about by a vicious governmental policy?

Taxes collected on farms in this part of our State, range from one to 1½ per cent., on city property from two to three per cent. on assessed valuation We think that they are excessive. Taxation constitutes a problem in the solution of which all honest taxpayers, whether farmers or others, are alike interested. Two reasons exist here for oppressive taxation: 1st, high levies for local purposes; 2nd, the large aggregate of personal property which evades taxation. Our legislature has sought and is still striving to correct the latter; so far with relatively meager results. That body is also trying to adjust the levying of the taxes, so that the requirements for State purposes will be indirectly assessed, while for local purposes the assessments will be mainly by direct taxation. Concerning local taxation we farmers are largely responsible for the large rates here. We want and demand good school-houses, good roads and bridges which we have generally secured; so, according to the old saying "those who dance should expect to pay the fiddler." "The stream cannot be purer than the fountain." Whether a government is corrupt or beneficent will usually depend on the character, virtue and intelligence of the people of all classes, who compose it. "The noble people will be nobly ruled, and the ignorant and corrupt ignobly."

Our monetary affairs are fortunately in such a sound condition that money commands a definite price in the market, and this is much less than it was 30 years ago, when farm products averaged about the same prices. The price of money here now secured by farm mortgages is from six to seven per cent., while it more readily brought from eight to 10 per cent. on the same kind of security 30 years since, when the currency was less stable and consequently less valuable. Now are we to understand that the holders of farm mortgages—many of whom are farmers—are avaricious and hard-hearted because they sell money at market prices? And are such mortgage claims to be denounced as oppressive and unrighteous? To do so would seem like communism. And yet the recent cartoon implies as much.

Our civil courts wisely guard with zealous care the interests of the debtor class, and will not permit usurious interest to be collected by any subterfuge if it can be detected. Thousands of dollars have been lost in this section by investing in farm mortgage notes on account of the subsequent depreciation of the security. Have the investors conspired to bring about this depreciation?

I do not sympathize with the effort which is constantly put forth, to saturate the farmer's mind with the idea that somebody is trying to hurt him. It has been dinned into our ears almost from time immemorial that the farmer is only a hewer of wood and drawer of water, that he is compelled to bear the burdens of all other classes. The jocular observation of Sir Geo. Campbell, the English traveler, that "among the Americans, for every man who really works with his hands, there seem to be two who seek to live by speculating upon him," is literally construed to mean that the farmer is the victim of the other two men.

The inculcation of such ideas must manifestly prove detrimental to the best interests of the farmer, and, besides, they are void of the truth. Farm produce always has a market value. It is also a cash article, which can scarcely be said of any other class of merchandise. Can the farmer reasonably expect more for his goods than what they are worth? It is true that it sometimes happens that the market value of an article of farm produce is below the cost of production. Does this not more frequently happen in the traffic in other merchandise? Even the vicious combinations of capitalists to abnormally affect the prices of the products of the farm, usually result in forcing them above, rather than below their real value in the markets of the world. The cornering of wheat last October in the Chicago market affords an illustration. Farmers who sold their wheat during that period, or soon afterwards, realized much more for it than it was really worth. Had I not "turned speculator" I might have obtained $1.15 per bushel for my 1,000 bushels of wheat in the Cincinnati market, which was nearly 16 cents per bushel more than it was worth the same day in Liverpool, England. The abnormal price was the direct effect of the Chicago "flurry."

That the pernicious and abominable trusts and combinations, which seek to interfere with the natural laws of trade, prove injurious to the great mass of people, I do not for a moment question; that they prove more detrimental, in the aggregate, to farmers than they do to a vast majority of other citizens remains to be demonstrated. These mercenary combinations should be regulated and controlled in the interests of *all* the people and not of any *particular class*. With this object in view, the tillers of the soil can very wisely and justly unite and cöoperate with the other classes, in securing equal rights for all.

In that good time coming, when the rings, monopolies and trusts, that seek through stratagem and tyranny to set aside the laws of supply and demand, shall be subjected to salutary laws, even then we tillers of the soil will find that our business, our prosperity, depend, to a great extent, on what we ourselves make them. We will find that social advancement is the result of individual advancement. We will find that virtue, knowledge and freedom must spring from ourselves; and that it is not by socialism but by individualism that the world is impelled forward. We will find that the road of human welfare lies along the old highway of steadfast well-doing, and that they who are the most persistent, and work in the truest spirit, will usually be the most successful. We will find that well directed toil, frugality and prudence will alone subserve our best interests. S. E.

Montgomery County.

FROM INDIANA.

Among the many cartoons that have appeared in the RURAL, none, it seems to me, among them all is, or was, more telling and to the point than that of February 2.

It cannot be denied that, in his relation to a great many other class interests, the farmer is made a patient, plodding beast of burden.

In this cartoon, the post of honor among the parasites is given to the money-lender, and very fitly, I think. The lesson intended to be taught is, not that the farmer shall consider his relation to other interests, as shown in the cartoon, as proper and just, and to be thankfully accepted by him, but to show him more clearly that a great many other interests have, in some way, got him in their power and are using him for their own selfish ends, as a beast of burden. But suppose this object-lesson should accomplish the object for which it is presumably intended—to open his eyes to the wrongs and injustice done him; what will it avail him? A goodly number of farmers clearly comprehend the burdens pressing down the agricultural classes, who feel themselves powerless to remedy the evil. Suppose the cartoon should open the eyes of all; have we any hope that they would right the wrongs? Is it not too much to hope that they could be sufficiently united to cast off the parasites, one by one, or restrict them to be content with what they could justly claim, and so no longer be parasites?

Let us suppose that the cartoon has done its work, and that there is a general feeling among the farmers that the work of reform should be commenced. Suppose at a great convention of farmers a resolution is offered that no interest should be allowed in any case whatever.

It would undoubtedly be voted down because the States have fixed the rate of interest the people can afford to pay,—or at least it might be said that is a reasonable view of it. On the other hand, whenever any of the States have proposed to lower the rate of interest, capitalists have threatened to withdraw their capital from those States, and thus greatly diminish the circulating medium. So we find the rate allowed by law to be from about five to 12 per cent., though different States fix the rate as high as six or eight per cent in the absence of contract, but allow the parties to make contracts for as high as 12 per cent. As the borrower is the servant of the lender, the highest rate allowed by law is the rate generally paid, yet it seems to be a well established fact that the annual increase of wealth does not exceed three per cent.

If we apply the examples in our lessons at school such as "If a rabbit runs at the rate of 100 yards a minute and a hound gives chase at the rate of 120 yards a minute, how long will it take the hound to catch the rabbit, the latter having a start of 100 yards?" It is only a question of time when the rabbit will be caught.

If we state the example in a different way, thus, "If a community is possessed of property worth $100,000,000 that increases at the rate of three per cent. per annum, how long would it take $10,000,000 of capital to absorb the property, the capitalists loaning to the property owners at the rate of 10 per cent?"

As in the case of the rabbit and the dog, it will be only a question of time.

The difference between the two examples is, that the former is only a supposed example, while the latter is in actual process of solution.

When the farmer clearly understands that as the problem goes on he will be ruined, he will insist that it be discontinued. But what is he to do? The capitalist is so powerful that he can force State legislatures to enact such laws as he desires.

This cartoon will no doubt suggest many remedies, and here is my suggestion as a beginning: Have Congress enact a law that no Federal court shall be allowed to render judgments on any note or other acknowledgement bearing a higher rate of interest than three per cent. and gradually the States will adopt the same reform, and the influence of such a law would be a gradual lowering of the rate of interest generally to a rate more nearly in agreement with the general rate of increase of property. S. B. H.

Crawfordsville.

FROM NEW JERSEY.

I have been listening to the parrot's "Farmin' don't pay," until I have wished some one would build a good strong fire in the stove, and make it too hot for him; but no one appears to have the fuel to spare. The parrot is right, but he is too much like the prosecuting attorney, who always tries to make the case look as black as possible. Farming doesn't pay in many instances, and, as effect follows cause, I will endeavor to point out some of the causes that produce failures.

1st.—Too large farms. Many a person thinks that he must have at least 100 acres, or he will not be considered a farmer. So he purchases a farm, but, as he has not sufficient capital to pay for the farm and stock, he pays half cash, and gives a mortgage for the balance. I see the RURAL has the right idea in its cartoon of February 2. That big, burly fellow with all his evil followers pressing the farmer to the earth like a cart beneath its sheaves is, I think, ready to indorse the parrot and say: "Farmin' don't pay," whereas, if he had bought less land, paid the cash, stocked his farm well, bought $100 worth of fertilizers and used them judiciously, he could sit down in a cosy corner with Uncle Jacob, and laugh to scorn the parrot's remark, "Farmin' don't pay."

2nd.—The old-rut routine of farming. Some men are so firmly attached to their fathers' modes of farming, that, if you introduced the subject of improved methods, they will "Po, Ho," stick up their noses at you, and call it book farming, and the parrot may well say to such men, "Farmin' don't pay."

3d,—Routine farming, such as growing one crop after another, selling everything off the farm, and returning nothing in the line of fertilizers except the little made from the stock on the farm, which is not one-half what it might or would be if all useful materials were utilized. This class of men will always tell you that farming doesn't pay.

4th,—Another class of farmers like to take things easy. They never have any system, or any plans laid for the season's work. To them, "sufficient unto the day, is the evil thereof." To them, the easiest way is the best, consequently the straw and other valuable materials are burned to get rid of them; the fields are overrun with noxious weeds, and there is a row of briers growing each side of the fences, often occupying a space six feet wide. The fences are in bad condition, and when the pasture is well eaten off, over go the cattle into the standing corn, or other crops, and the men and dogs destroy as much as the cattle eat, in getting them out. When the cattle once get started, it is a hard matter to stop them, so valuable time is lost, the profits of the crops are greatly diminished, if not entirely lost, and at the end of the year, the farmer finds it difficult to meet expenses. The next thing is a chattel mortgage at 15 to 25 per cent. bonus, and he very naturally concludes that "farmin' don't pay."

I think that the parrot must have lived for a considerable length of time with this class of farmers.

Kingston. J. P.

INCREASE IN THE PRIZES OFFERED BY THE MAPES COMPANY.

We desire to increase the amount of the prizes offered by us in connection with those offered by THE AMERICAN AGRICULTURIST, and as the entries to the published prize schedule are closed, we herewith amend our prizes, to read as follows:

Special Prizes.

MAPES POTATO MANURE OR GOLD COIN—If the AMERICAN AGRICULTURIST Grand Cash Prize of $500 in gold coin goes to potatoes grown exclusively on Mapes Potato Manure, the Mapes Formula and Peruvian Guano Co., of 158 Front Street New York City, will give $600, making the total cash obtainable for the Prize Crop, under these circumstances, in gold coin, **$1100.00**

MAPES POTATO MANURE OR GOLD COIN.—Provided the above premium is not taken, the Mapes Formula and Peruvian Guano Co., of 158 Front Street, New York, will give $600 in gold coin for the second, third fourth and fifth Prize Crops for the largest yield of potatoes grown in this competition with the Mapes Potato Manure exclusively; second prize, $225; third prize, $175; fourth prize, $125; fifth prize, $75. Total - - - - - - - - - - - - - **$600.00**

Our new pamphlet (1889) contains full detailed description, with illustrations, of **best methods used in growing potatoes**, field and trench methods, also for corn, grain crops, tobacco, fruits, etc. SOME LARGE YIELDS WITH THE MAPES MANURES: CORN—4 424-1000 acres (season 1888) 1040 bushels corn (ears); equal to 116¾ bushels shelled corn per acre. POTATOES—On one measured acre (1888) 501 bushels (with a severe drought). Over 1000 bushels per acre on 1-8 acre plot. Over 300 bushels per acre, common field culture. OATS—80 bushels per acre. WHEAT—Over 40 bushels per acre. The Mapes Manures are True Manures, and not Stimulants.

"Our own experience with various commercial fertilizers has convinced us that with judicious use of the Mapes Manures worn out lands can be **restored to fertility quicker and with less expense** than in any other way."—*American Agriculturist.*

"The remarkable success which has attended the Mapes fertilizers has given them an enviable reputation and standing, not only in the United States and Provinces, but in Great Britain and other European countries."—*American Agriculturist.*

"Under averge conditons, and in far the greater number of cases, we do not hesitate to name the Mapes Potato Manure as the **best and most profitable** fertilizer for potatoes."—*American Agriculturist.*

Send postal for pamphlet. No charge.

THE MAPES FORMULA AND PERUVIAN GUANO CO., 158 Front Street, New York.

THE QUESTION OF THE HOUR.

"Tilly, how are you going to have your new spring hat trimmed?"

Humorous.

The RURAL NEW-YORKER *is prepared to offer very liberal terms to good, responsible,* PERMANENT *agents. Correspondence solicited.*

YOU cannot expect a man to tell which way the wind is, simply because he is a little vain.—*Boston Com'l Bulletin.*

"I—AW—wahnt a tie, doncher-know, to match my eyes." "Let me see. Blue eyes and—er—sorry, sir, but our blue ties with red edges are all sold. Have some in next week."—*Bazar.*

WE know of a man who actually kept a diary through to the 31st of December; but he didn't commence it until May; so the New Year offers a chance to anybody who wishes to make a record.—*Puck.*

A SOUTHERN hotel advertises among its attractions a "parlor for ladies thirty-five feet wide." We trust this paragraph will catch the eye of the woman who occupies three seats in a crowded car.—*Yonkers Statesman.*

HOUSEHOLDER (to tramp): "No, you can't have anything to eat here. Go right away!" Tramp: "That's what they told me over the way. They said you had only one meal a week here. Sorry I troubled you. Ta-ta!"—*New York World.*

THE craze for whistling among girls is seriously troubling the humorous editor of the Boston Transcript. He says it is almost impossible to tell whether a girl is soliciting a kiss, or is only preparing to pucker. He ought to give the girl the benefit of the doubt.—*Youngstown Herald.*

A THANKFUL SPIRIT.—Teacher: "Johnny, can you tell me anything you have to be thankful for in the past year?" Johnny (without hesitation:) "Yessur." Teacher: "Well, Johnny, what is it?" Johnny: "Why, when you broke your arm you couldn't lick us for two months."—*Life.*

For rates on the TRY ME, the *best* hand lever Feed Cutter (3 sizes). Ad's G. S. GARTH, Mill Hall, Pa.—*Adv.*

Timely Topics and Suggestions to Vegetable Growers.

SUGGESTIONS AS TO CULTIVATION AND WHEN TO PLANT.

Peas, Beans, Cabbage, Borecole, Brussels-Sprouts, Cauliflower, Carrots, Beets, Celeriac, Cucumbers, Corn, Egg-plant, Onions, Leek, Garlic, Lettuce, Mushrooms, Okra, Peppers, Radishes, Spinach, Squash, Rhubarb, Tomatoes, Potatoes, Turnips.

Communications from Matthew Crawford, of Ohio; J. M. Smith, of Wisconsin; William Falconer, of Long Island, N. Y.; J. A. Foote, of Indiana; Dr. T. H. Hoskins, of Vermont; Prof. Goff of the N. Y. E. Station; E. S. Teagarden, of Iowa; H. M. Wysor, of Virginia; Fred Grundy, of Illinois; H. M. Engle, of Pennsylvania; Jonathan Talcott, of New York; A. B. Coleman, of Kentucky; F. H. Valentine, O. H. Alexander, A. C. Bates, et al.

FROM M. CRAWFORD.

Four years' service, in my youth, in a market garden of 100 acres gave me such a love for the work that it has continued until to-day, although it is more than a quarter of a century since I gave it up for another branch of horticulture, that is even more inviting. I am still delighted to receive a seedsman's catalogue, and always feel under obligations either to patronize the sender or influence some one else to do so. Each season I cheerfully yield to the temptation of buying several times as many seeds as I need. I suppose it will always be so, for two nice catalogues that came to-day make me impatient for the coming of spring so that gardening may commence. Were it not for the necessity of earning a living, my inclinations would lead me to spend my entire time in testing new things, raising seedlings and seeing what perfection could be reached regardless of cost. Fine specimens of flowers, fruits and vegetables are brought for exhibition, at the monthly meetings of our county horticultural society, and their merits, with the methods used in their production, are freely discussed. This is another incentive to the testing of new things. I have grown a large number of varieties of squashes and have never yet found anything superior to the Hubbard, although the Marblehead and Butman are about equal to it in all important points. When the Hubbard was introduced, 30 years ago this spring, I procured seed and raised over 300 fine ones. In the fall and early winter I ate of them so freely that my skin was colored almost to an orange tint. I had some doubts as to whether this was due to the squashes, but these doubts were all removed the following winter when I saw a number of persons affected in the same way, and all of them were exceedingly fond of Hubbard squashes.

I raise from one to three new varieties of tomatoes every year, and the Volunteer has proved to be the finest I ever had. It combines about every desirable quality. The Champion of England pea is as good a variety as I ever raised, but I prefer those that need no support. Of this class we have found nothing better than the Yorkshire Hero for the main crop. The American Wonder and Blue Peter are desirable early sorts. The Lima is our best bean, but it is too late unless started in a frame. A late frost killed ours last year, and the second planting was of little account. The Amber Cream sweet corn pleases me as well as any variety I have tested. This, with the Cory for early, and the Egyptian for late gives a good supply. The Early Paris has been our favorite cauliflower, and I have seldom if ever seen as fine specimens of any other variety. When the season is moist enough, it is about as certain as cabbage. When in Ontario, last September, I saw a block of 21,000 of the French Erfurt and Henderson's Early Snowball that were finer as a whole than any lot of Early Paris I ever saw.

If confined to a single variety of cabbage, my choice would be Fottler's Brunswick. Last season I had Maule's Surehead and it is very fine. I never raise early varieties. To have the best success with cabbages and cauliflowers it is important to have good plants. My plan is to sow the seed, about May 10, in a shallow box containing about two inches of potting soil. This is set on a shed roof and kept watered until the plants are three inches high. They are then pricked out a few inches apart until needed. The fly never gets to them, there are no worms at the roots, and they grow right along when transplanted.

Last season I had the Eclipse, Lentz and Arlington Favorite beets. The last is the finest turnip beet I ever raised, and the Eclipse is the best early variety for us. There being no great pleasure in raising cucumbers, I do no experimenting in that line, but let the White Spine answer for all purposes.

I take real pleasure in raising onions, and had 10 varieties last season on about three square rods of land. Of the lot I would choose two—the Wethersfield for home use, and the Yellow Danvers for market. The former is of fine flavor, a good keeper and may be cooked in a few minutes. The Danvers is rather earlier, and more salable. Each of these yielded at the rate of over 800 bushels per acre. The Spanish King yielded at the rate of over 1,200 bushels per acre; but the variety is not well fixed in color or shape. Many of them were lemon-shaped and had thick necks. The Mammoth Pompeii are very large, flat, and ripen well, but they were of several shades of color. The Early Pearl, Giant Rocca, Prizetaker and Silver King, were not a success here.

I never fail with common strap-leaf turnips. My plan is to clear off a place about the first of August, and put on a good allowance of dissolved bone and wood-ashes, and then go over it with a wheel-hoe until the surface is very fine. It is best to sow after a rain. The White Russian has given us great satisfaction as it is of fine quality and a late keeper.

I have a weakness for *good* potatoes, and test a great many. Of over 20 varieties grown last season, the Delaware gave the greatest proportion of large, fine-looking tubers. The quality is good, too. The Puritan seems to be all that was claimed for it, and it must become a favorite. The Monroe County Prize and the Everitt are very productive and seem to be quite desirable. I am greatly pleased with two Ohio varieties that are to be offered this spring—the Gov. Foraker and Mrs. Foraker. The former resembles the Burbank, but is even more uniform in shape and size, while the latter is like a fine specimen of the Snowflake, with eyes even with the surface. I think that the Mrs. Foraker is the most beautiful potato ever introduced. We have relied upon the Beauty of Hebron for our main crop, but the Clark's No. 1 is about as desirable. The Empire State is perhaps the most profitable market variety grown in this vicinity.

Summit Co., Ohio.

FROM WILLIAM FALCONER.

BEANS, SNAP.—Mohawk and Valentine are favorites of mine; because both are green-fleshed and of capital flavor, and they do not ripen up all at once; and as the Mohawk is a few days earlier than the Valentine, by sowing a couple of rows—one of each kind—once a week, I can have an unbroken succession of good beans. The Golden Wax is as good as any yellow-fleshed snap bean I have grown.

POLE BEANS.—I love to grow the red-flowering Scarlet Runners for their blossoms more than for their pods. Giant Wax is a good sort to grow for pods, but for shelled beans I think all varieties pale before the Limas.

BEANS, LIMA.—Dreer's Improved is my first choice, because it is the best flavored. The pods are short and the beans are small and plump, but the variety is a heavy cropper.

BEETS.—Eclipse I consider the best for a turnip beet, and Long Smooth Blood for a long beet. With turnip beets more depends upon the purity of the strain than on the variety.

BORECOLE is better known as kale. Of Extra-curled Dwarf Erfurt I got a packet from Thorburn & Co. a few years ago, and thought so well of it that I have ever since kept my own seed. It is a real dwarf, very curly, hardy, and capital to eat. Ordinarily, kales are too lanky-stemmed.

BRUSSELS-SPROUTS.—For dwarfs we have lots of varietal names, but the names don't amount to anything; each name simply means a strain. The smaller and harder the sprout, the better; the bigger, the poorer.

CABBAGE.—Early Jersey Wakefield I prefer for early; All Seasons or Early Summer, for mid-season; and Drumhead Savoy for late. I have lots—Vandergaw, Flat Dutch, and other varieties all bedded in the ground now—but I don't eat any of them, because I also have lots of Savoys, and the Savoys are immensely superior to plain cabbages.

CAULIFLOWER.—For early, for fall, for holding over in frames—it's all the same—I have come right down to Erfurt. Well, you may take it under the name of Snowball, Seafoam, or any of many others; to me these are all strains of Erfurt.

CARROTS.—Early Scarlet Horn I select for early, also for a small sowing for summer and fall use. When young and tender they are cooked whole. Half-Long Stump-Rooted I like for the main crop, because it is a capital carrot to eat, satisfactory in growth, and never too large. Big carrots are all right for the cattle, but they are not so good for the kitchen.

CELERY.—Give me White Plume for use between September and December; Golden Heart for use from December till spring opens; Clark's Pink or London Red, for a red celery. The red celery is the best flavored.

CELERIAC.—The Prague I think the best, because it is the largest-bulbed variety, and the "bulb" isn't so rooty near the top as are the Paris or Erfurt varieties.

CUCUMBER.—If confined to one variety, I would take Nichol's, because it is good for slicing or pickling, and very prolific. For size and fine appearance I like Tailby's, and for growing in frames or green-houses, Telegraph, because of its long life and free cropping tendency, but the seeds are too costly. It is useless out-of-doors.

CORN.—The choice in this is much a matter of taste and land. Cory is excellent for early; Concord for summer crops, and Stowell's for latest. Concord is always reliable with me, but not so with some of my neighbors. I like white corn and medium-sized ears.

EGG PLANT.—New York Improved comes first with me because the plant is vigorous and the fruit handsome, and if the latter is cut when but a little larger than a Duchess pear, it is just as good to my taste as the Black Pekin. I grow several other varieties, but regard them as being more odd than useful.

GARLIC.—The common sort I grow. Two or three other varieties are cultivated in Europe, but, so far as I have learned, they have not found their way to this country. The "loudest" of the onion race; never use it when you expect company!

LEEK.—I prefer what is sold here as Large American Flag. All the leeks do well.

LETTUCES.—Boston Market is fine for winter, because it hearts well, can be planted closely and is pretty hardy. Salamander can't be surpassed for summer, because it is as good as any other cabbage lettuce, lasts as long without "bolting," and I have found the strain to be good. A good strain has a good deal to do with good lettuce.

MUSHROOMS.—The English Gray is my choice, because it is the most delicious vegetable on the face of the earth.

OKRA.—Dwarf Green can be recommended, because it takes up less room than the six or seven-feet-high tall varieties, also because in my opinion green pods are much to be preferred to pale or whitish pods.

ONIONS.—Yellow Danvers, Large Red Wethersfield and Southport White Globe are my selections, because I want to have red, white and yellow-skinned onions and I don't know three better varieties than these. I wouldn't

be bothered with top onions as a crop, and of recent years potato onions in this neighborhood have become more or less diseased. This is a pity as they were a safe crop to have, although one of very poor quality.

PEAS.—Improved Daniel O'Rouke (it is the same as First of All, Extra Early, Earliest of All and lots of other synonyms) is my choice for the first four or five days' peas, and Alpha for the next fortnight. McLean's Advancer comes in eight days or thereabouts after Alpha which is useless in hot weather, but Advancer continues throughout the pea season. Champion of England from the 20th of June till the middle of July cannot be excelled for quantity or quality, only it must have brush. Stratagem and Bliss's Abundance are splendid peas. Blue Beauty, Midsummer and Quantity, new peas of last year, gave me much satisfaction, but require further testing.

PEPPER.—Give me Red Cayenne for pickling and Ruby King as a large pepper, as it is the largest pepper, and I find this is the sort most called for.

RADISHES.—Among turnip-rooted radishes French Breakfast is good at all times, so is Scarlet Turnip. Among long-rooted radishes Wood's Early Frame is very fine, succulent and early; but for midsummer work Beckert's Chartier may be better, as it lasts longer. A word here about radishes:—They are more appreciated in cold than in hot weather; a radish with a white, gray, purple or black skin is not appreciated; red skin is the only sort we want in radishes; furthermore, mildness is a very poor quality in a radish. The best radish should have a bright-red skin and be extremely tender and juicy and at the same time pungent. Violet-skinned Olive-Shaped was the best radish so far as quality was concerned in about twenty kinds in my trial grounds last year, but the color of its skin will "kill" it. Scarlet Chinese is the best variety for storing in winter; but stored radishes of any kind are pretty poor vegetables.

RHUBARB.—Monarch is to be preferred for size and quality, and Victoria for its beautiful red color. We usually raise rhubarb from seed and keep what comes; for the seedlings are not always the same as the parents. There is a current idea that St. Martin's, Monarch and some others are new varieties, but this is not so; although but recently disseminated here, they have been grown in Europe for many years.

SPINACH.—Viroflay, which is a large form of the Round-seeded, is my choice. The market gardeners around here grow a good deal of the Savory-leaved; but with me it does not yield as much spinach as does the Viroflay. For hard winter weather take the Prickly-seeded; for hot, dry summer weather, the New Zealand, and sow it in fall and cover over the seeds (which will not germinate till the following spring) with a mulching; or delay sowing till June and scald the seeds before sowing them.

SQUASH.—Bush Summer Crook-Neck for early; Pine-Apple for late summer; Boston Marrow for fall and early winter, and Hubbard for general winter use, can hardly be excelled. Cheese pumpkins make fairly good pies. The selection of squashes is a matter of taste. If less weight were given to squashes and more recognition to other garden vegetables by our horticultural and agricultural societies, it might be better for us all.

TOMATOES.—Trophy, Perfection and Acme or selections of them. Burpee's Glen Cove, a careful and long-continued selection from Trophy by Scudder & Townsend, is one of the finest tomatoes I have ever grown. The Volunteer is the best form of Perfection, and Favorite appears to be a good selection of Acme. At least this is how they have appeared in my trial ground. I am very well pleased with the Lorillard as a winter-forcing variety, on account of its round, even form, firm texture, and bright-red color. It is a selection by Mr. John G. Gardner of Jobstown, N. J., and a couple of months ago I saw with him there hundreds of plants in every stage, and bearing heavy crops of fruit ripe and ripening, and greenhouse after greenhouse filled with them.

TURNIPS.—Red-Top Strap-Leaf is a capital flat turnip; Purple-Top White Globe is, all things considered, the best of all the soft turnips. Milan and Munich turnips have recently had a good deal of reputation because of their earliness, but they are among the very poorest of turnips, hot and bitter. Improved American is a very good Ruta-baga.

Queens Co., Long Island, N. Y.

FROM J. M. SMITH.

The following embodies my experience with the different varieties of vegetables grown by myself during a term of about 30 years:

PEPPERS.—After having tried a number of varieties of this plant, I have settled upon the Bell or Bull-Nose as the best, all things considered. It is large, mild in flavor, and certainly as productive as any that I have tried. I have occasionally had a fine growth of plants and plenty of bloom and not a single fully developed pepper during the entire season, and very few poor, small specimens unfit for market. I am unable to give any reasons for these failures, and I have never seen in any book or paper any explanation that threw any light on the subject.

RHUBARB.—I prefer the Linnæus. It is very early, a good yielder, and of much better quality than the very large variety known to us as the Cohoon, which has a much larger stalk and leaf, but it is later, very coarse, and exceedingly tart. Its redeeming quality is that, owing to its very large leaves and stems, it is much less expensive to gather and pack than the Linnæus, though I doubt if it yields more weight during the season than the Linnæus, as it has a much smaller number of stems and leaves.

SQUASHES.—For first early I prefer the White Bush Scallop; then a few of the Boston Marrow for early fall, and the Hubbard for the main crop. The Hubbard has become such a favorite with us in the Northwest that nothing but something remarkable in its line could displace it. It is a strong grower, very productive, and of good quality, and a good winter keeper.

TOMATOES.—The new varieties of tomatoes, like the new varieties of strawberries, come and go like the summer clouds. I have tried many of the new varieties within the last 25 years; but am now growing the Acme and Trophy almost exclusively. If compelled to choose any single variety, I would take the Acme in preference to any other that I have ever grown. It is a good bearer, and is a few days earlier than the Trophy. It is a little more showy in the basket, and about equal in quality. With me the early-ripening sorts have not rotted quite so badly as the Trophy, though both have rotted badly for the last two years. I know of no method of protection against the disease that causes rot. Perhaps when we are sure of the cause, we may find a remedy.

PEAS.—For my first early, I order the Extra-Early Daniel O'Rourke. I have more than once ordered a number of the so-called earliest varieties of different growers, and planted them, side by side at the same time, on the same kind of soil, and treated them precisely alike in every way, and they have grown and matured so entirely alike that they might all have been taken for the same variety. Even when tested on the table, they seemed the same, and I am by no means sure that they were not, each seedsman having given them a name to suit himself. Hence I order Daniel O'Rourke, as I have so far always obtained them true to name, which is more than I can say of some of the other so-called new varieties. For second early, and for late varieties I prefer Bliss's American Wonder. The Daniel O'Rourke may be sown as soon as the ground is in good condition in the spring, as the plants will not be damaged by slight freezing weather after the seed has been sown. The Wonder is rather tender in getting started, and if sown too early may rot in the ground, or be so damaged that it will not mature a large crop. Hence the seed should not be sown until freezing weather is entirely over. When fairly started, the vines are with me good bearers, and the peas are of excellent quality. The Champion of England is a very fine late variety, but the vine grows quite tall, and will not do its best without support, which increases the expense of growing so much that I have nearly discarded it, and prefer a second sowing of the Wonder for a late crop, as it is nearly as good as the Champion, and is a low-growing variety. McLean's Advancer and a number of others are very good, but too many varieties I do not consider desirable.

BEANS.—I prefer the Golden Wax to any of the bush varieties that I have grown. Wax beans are fairly early, and much finer in appearance than any of the green varieties that I have tested, and also of good quality, so good that it is useless for me to offer the green varieties in our market, as my customers will not buy them. The Limas are undoubtedly the best of all pole beans, though we sometimes have a season too cool for them to do their best in our latitude. In 1888 we had such a season; I left a portion of mine without poles, cutting back the vines once, and when we came to gather the crop, we found the finest and best beans on this portion of the plot. I intend to experiment still further and see if the result will be the same.

SWEET CORN.—The Cory is the earliest sweet corn I have tried, that has a moderately fair-sized ear. It is not first-class in quality; hence I only grow a small piece of it to last until the Early Minnesota is ready for market, and of this I grow only enough to last until the Crosby is fit for use. The last-named is my standard, being better, I think, than the Evergreen, producing a larger number of good marketable ears to the acre than any Evergreen that I have tried.

CAULIFLOWER.—The Snowball does better with me than any of the old varieties. Like others of its kind, it requires a very rich, moist soil to enable it to do its best.

CELERY.—The White Plume has become very popular, and I am growing it to some extent. It is very quick-growing, very showy upon the table, and will sell with less bleaching than the other kinds; but it is, in my opinion, very indifferent in quality, and a very poor winter keeper. Hence I grow it only for fall use. The Golden Dwarf is my standard of excellence. It may be set as late as August 5, and still it will make a fine crop. I grow it entirely as a second crop: the past season after early potatoes.

CABBAGE.—Jersey Wakefield is my standard for first early, Newark Flat Dutch, and Henderson's Summer for second, and also for late fall varieties. The old Premium Flat Dutch does well, but requires nearly the whole season to mature, and I cannot afford to give it the entire season on such high-priced land. Hence I do not grow it largely. I can turn under my strawberries after the fruit is gathered, and rely upon a good yield of Newark Flat Dutch, while under the same circumstances the Premium Flat Dutch would be likely to fail entirely to mature. I consider it safe to set the former as late as July 15.

LETTUCE.—I use the Boston Market almost exclusively for hot-beds, as being the most desirable of all that I have tried for that purpose. It is a quick grower, and forms a nice head of excellent quality; but not quite large enough for out-door summer use. For this purpose the Curled Simpson has been my standard for years, though the Black-Seeded Simpson is an excellent variety. Neither of these is, strictly speaking, a header, though both form large masses of leaves of excellent quality. The Boston Curled is very showy, but not equal, in my opinion, to the Simpson; hence I grow the latter almost exclusively.

BRUSSELS-SPROUTS, BORECOLE AND CELERIAC are used very little here, and I have grown them to no extent. They require about the same soil, care and culture as cabbage and celery.

CARROT.—For first early I grow the Early Scarlet Horn, as it is a very pretty root, and nice for bunching; but I use it for no other purpose. For the main crop the Half-Long Stump-Rooted is my favorite. It is a quick grower, has a small top, and the seed may be sown more thickly than that of either the Long Orange or the White Belgian. It does not grow quite so large as either of the others; but the greater number that will grow upon an acre, will, I think, make the yield equal to that of any other variety. It is excellent for the table, and also as feed for stock.

CUCUMBERS.—The Early Frame is the earliest of the really valuable varieties for the table, and is also largely grown for pickles. The Early Russian is about one week earlier than the last-named, but is so worthless after the first two or three pickings, that I have discarded it entirely. For the main crop for the table I consider the White Spine the best of all. It is of good size, smooth and firm, and will, if properly cared for, keep in good condition for a number of days after picking. For several years I have grown very few of any other variety.

EGG PLANTS.—I have tried several kinds, but have succeeded best with the New York Improved. Egg plants are not largely grown here, the demand being very small. They require very rich land and thorough cultivation, and, in addition, hot summer weather to enable them to do their best. Their worst enemy here is the Colorado potato beetle.

ONIONS.—There has been, I think, a very foolish effort for a few years past to boom some of the large, coarse and rough-growing varieties of onions. For sets for first early spring onions, I grow a variety of shallots which I plant in late summer or early fall, to get them well started before cold weather and they remain in the ground with little or no damage from cold. They come on very early and are used until we can get better ones from sets of the Yellow Danvers or some of the other black-seeded varieties, though the last-named is my standard. For the main crop, I use the Early Red Globe for early, and the Globe Danvers for the bulk of my crop, with also a small quantity of the Red Wethersfield, as some prefer it. With us in the Northwest, the Yellow Danvers is the most popular variety, usually selling for a few cents more per bushel than any other sort. It is useless to try to grow a large crop of onions upon poor land; neither will it do to neglect them when very young. I know of no plant more impatient of a little neglect when young than the onion, as it rarely recovers from any serious check to its continual growth.

GARLICS AND LEEKS.—These are not grown to any extent here, and I rarely have any calls for them. They require good land and thorough cultivation.

BEETS.—I use the Early Egyptian for my first early, and the Early Blood Turnip for second early and for the main crop, both being good growers, of good quality, good keepers, smooth, and of good size, though not too large. They will grow to be of fair size for table use and of excellent quality if sown as late as June 15, if the land is in good condition, and they are well cared for, and they are much preferred, with us, to any of the long varieties.

POTATOES.—For first early I have found nothing equal to the Early Ohio. It is with us a quick grower, of large size, fair in quality, and when planted and cultivated according to its requirements, it yields largely. It has a straight, bushy top, and generally there are few potatoes to a stalk. I plant in drills 30 inches apart, with the potatoes cut to one or two eyes each, and one piece in a place, about 10 or 12 inches apart in the rows. The land is rich and they are kept well and thoroughly cultivated. The result is uniformly large crops. I am not satisfied with less than 250 bushels per acre, and with a favorable season there should be more than that. For second early, and late crop, I prefer the Beauty of Hebron to any other that I have tried. If the land is very rich, it would not be safe to plant "seed" as closely as directed for the Early Ohio. Make the rows a few inches farther apart, and they will yield large crops of choice potatoes. I do not think it best to plant potatoes two years in succession upon the same ground. I have heard it stated that there are some varieties that are bug-proof, but I have never seen any such.

RADISHES.—I raise a few of the French Breakfast for very early, and sometimes for particular customers during the season; but for the main crop I rely on the Long Scarlet Short-Top. It is a quick grower, showy and attractive in appearance, and of good quality, and gives better satisfaction in our markets than any other that I have tried. For winter radish, I grow the Chinese Rose, but the demand for any variety of winter radish is small. Radishes prefer a light, sandy soil fairly fertilized, though they will do fairly well on a thinner soil than any other of our garden crops; but the proper fertilizer brings them on much more quickly.

SPINACH.—This is not grown largely here. I prefer the Round-Leaf variety. Asparagus is generally used, and, as a rule, is much preferred by our customers as an early dish in the time of greens.

TURNIPS.—I have of late years grown the Purple-Top Strap-Leaf almost exclusively, as it is a quick grower, of good quality, making nice feed for stock, being also good for the table. It is grown mostly as a second crop, and may be sown as late as August 15 with good results, if the necessary conditions are complied with, viz., good soil in good condition, good seed sown in drills 14 to 16 inches apart, and then good cultivation after the plants come up; the roots are cheaply grown, and with me they are almost a sure crop.

OKRA.—This plant is so little used here that I have never grown it to any great extent. Ground that would grow beans and peas would grow okra with reasonable care.

CONCLUSION.

DURING an experience and a constant study of about 30 years, I have learned a few things that I think I am sure of: First, growing either fruits or vegetables in such a manner as to make a success of either or both, is no business for a lazy man. Second, the business is no better for an ignorant man than for a lazy one. Third, it is not a business that one can successfully take up as a temporary thing, to be dropped again when there is an apparent prospect of something that may prove a little better for the time being. Fourth, no man, however extensive his reading may have been, is at all safe in attempting the business on a large scale, unless he has had some considerable personal experience in growing the articles with which he hopes to attain success. Fifth, the difference in price between a first-rate article nicely prepared for market, and a fairly good article only half prepared, constitutes success on one hand, and failure on the other. Sixth, success on poor land is impossible. Finally, a man with good soil, well cultivated, having intelligence and ceaseless industry, and an almost tireless energy and perseverance, and a growing market within his reach, will be as certain to reach success in this business, as in any that he could follow.

Brown Co., Wis.

FROM J. A. FOOTE.

As to the best varieties of vegetables, it is difficult to make a choice in some cases; but the following I regard as the very best for the garden, restricting the number to a few sorts.

DWARF BEANS.—Improved Red Valentine I think the best green-podded, having a round pod and being fleshy, tender, early and productive. The White Valentine is also good. I should plant no flat pod dwarfs. For wax or yellow-pod the Black Wax is one of the best as to quality. Golden Wax is good and very productive, but it is more liable to rust. Of the newer wax sorts I think Detroit Wax is one of the best.

POLE BEANS.—Horticultural remains a standard, especially for shelling. The old Speckled Cut-Short is hardly surpassed by any of the new sorts. A bean still somewhat local that goes sometimes by the name of Rhode Island, is first-rate in quality for a snap besides being early and productive. For a yellow-pod the Giant Wax is excellent and should be used more extensively than it is; but I feel inclined to place Dreer's Early Golden Cluster at the head of all. Its immense, beautiful and tender pods borne in great profusion, entitle it to the first place.

LIMA BEANS.—I have not thoroughly tested the newer sorts of these. I prefer a good stock of the regular Large Lima to Dreer's Improved. If the Extra-Early is really earlier, that is a great advantage in the Northern States. The Dwarf Lima I have not tried.

PEAS.—All of the extra-early white peas offered under a variety of names are almost identical, and any one of them is to be placed among the sorts to be chosen. The Alaska for a blue pea, being perhaps earliest of all and a fair pea as to quality, may be substituted for the whites. I know of no pea that excels the Advancer in delicate flavor, and being a large pea and only about five days later than the earliest, it should be in every garden. This should be succeeded by the Stratagem, one of the largest and finest of wrinkled peas. Then comes Champion of England for a tall, late pea; fine quality and great productiveness belonging to it in large measure. For dwarfs, American Wonder is excellent for earliest and Little Gem for second early. There are many other good kinds, but I would never give a place in my garden to the old-fashioned Early May or Marrowfats under any name as long as I could get seeds of the kinds named above.

SWEET CORN.—The Cory is decidedly the best very early. It should be followed by Perry's Hybrid, a fine sort both in size and quality. For late it is difficult to choose between Evergreen, Egyptian and Mammoth. The first remains soft the longest, but is not so sweet as the others. Mammoth is the largest and sweetest, but it has a shallower grain. Egyptian is prolific.

BEETS.—Egyptian, Eclipse and Bassano are all about equally early. Bassano is so much sweeter and tenderer that I prefer it, although it cooks light in color. Early Blood Turnip is the standard, and no other is needed beyond those named.

CABBAGE.—Early Jersey Wakefield, Early Winningstadt and Henderson's Early Summer are all early and good—so good as to leave little room for choice. All Seasons has proved to be first-rate and doubtless, is good for early, medium and late, as its name indicates. A good Late Flat Dutch, whether called Premium, Excelsior or by the name of some seedsman, will complete the list for any garden. Anything larger than these is not wanted. The Drumhead Savoy, however, may be added as superior in quality.

CAULIFLOWER.—Early Snowball and the genuine Extra-Early Erfurt are well-known to be good in all respects, in giving fine, large heads and in their reliability in heading. I think, however, that Long Island Beauty is a little superior.

CELERY.—Golden Heart, Half Dwarf and White Plume are the best for general use in a long list. I should want also a red—London Red or New Rose.

CARROT.—For early, Early Horn; for the main crop, the Danvers.

CUCUMBER.—Some variety of White Spine should be chosen for early, and Nichol's Medium for later use both for table and pickles. Of the long kinds Long Green Turkey is much the best, being very straight, and of a dark-green color.

LETTUCE.—Black-Seeded Simpson is most desirable for the earliest and for forcing, being rather superior to the white-seeded. Early Cabbage for a heading sort, Green Fringed for garnishing. Hanson is good, also Marblehead Mammoth for size and quality.

MUSKMELONS.—When I speak of melons, I must remind myself that we are talking now of home gardens, and not of market gardens. I should therefore choose one or both of these two, Osage or Early Hackensack. Some of the newest introductions are, without doubt, fine, such as Emerald Gem and Champion Market.

WATERMELON.—For the garden, out of all the varieties in the catalogues, I should take the Icing, either the Dark-Skin or the Light, a melon of medium size, with very crisp and tender flesh of delicious flavor.

ONIONS.—The old favorites remain—Red Wethersfield, Yellow Globe Danvers, and White Portugal. There are several foreign onions that seem to give good satisfaction, but I cannot speak of them of my own knowledge.

PUMPKINS.—I do not know any variety superior to our common Sweet Field or Cheese pumpkin.

PEPPERS.—Sweet Mountain, Golden Dawn and Ruby King are good large peppers (the last being the largest) of good shape and productive.

RADISHES.—For earliest I prefer a turnip variety, and of such kinds the Earliest Erfurt is the best in color, crispness and quickness of growth. Then come Long Scarlet Short Top and Mammoth Long Rose, the latter being good for any season. To these may be added White Stuttgart for a large summer solid radish.

TOMATOES.—For a purple crimson tomato I would choose the Essex Hybrid in preference to the Acme, because it is a little earlier and freer from rot. For a scarlet the Perfection is good enough for me. The Mikado although it furnishes some rough fruit, is prolific and the fruit is fine and very large and the variety is, withal, early. Optimus is first-rate. From one season's trial, I think highly of Dwarf Champion with its tree-like stalk and perfectly smooth pink fruit in abundant clusters.

TURNIPS.—For spring sowing, Earliest Bloomsdale Red-Top and Early White Dutch are my choice; for fall Red-Top Strap-Leaf and Red-Top Globe. No turnip surpasses the latter in quality, and it will yield 50 per cent. more than the flat sorts.

POTATOES.—There are so many good potatoes that to make a selection is difficult, and in various soils and climates there must be a great difference in choice. From my own observation I would not hesitate to choose Early Ohio for sandy soil, and Beauty of Hebron for a heavier one. Then from one season's trial I would take Charles Downing for its many good qualities—earliness, smoothness and table quality. In rich soil it proved very productive. There are many other good sorts old and new, (the Early Rose is yet hard to beat) but my preferences are as above.

Montgomery Co., Ind.

FROM T. H. HOSKINS, M. D.

OKRA.—Even the earliest dwarf sort amounts to nothing so far north as this (45°). It will grow and fruit but the pods are hard and woody.

PEPPER.—In warm seasons we get pretty good crops of the earlier varieties. Cayenne and Bell do best.

SQUASH.—Summer Crook-Neck for early. Essex Hybrid and Hubbard are the most satisfactory, though Boston Marrow is also popular. They all require a rich, light soil, and do best on a slight southern slope. I grow them to succeed early peas, the hills being made six to 12 feet apart, and thinned to two plants, as soon as danger of striped bugs is over. The larger squash bug is not yet known here.

TOMATOES are treated the same as peppers, the plants being grown under glass, and set out the second week in June. They get no pruning or training; but old barrel staves are crossed around the plants, as they branch out, to keep the fruit off the dirt. A paying crop one year in two is about all we expect here.

PEAS.—Rawson's Clipper is our earliest, followed by Vermont Wonder, Telephone, and Aroostook Marrow. Squashes follow the Clipper, and late cabbages the Wonder. No support is used, but the taller sorts are planted in double rows (20 inches asunder,) and the vines in these are bent toward each other until they cling, and thus support themselves. The alternate spaces are made wide enough to accommodate pickers; and in these the hills in which squashes are planted are made. The early dwarf peas, planted between cabbages, are not gathered for market, but are left to ripen. Telephone is preferred to Stratagem among the large-podded kinds, because it holds its pods clear off the ground; while Stratagem must be mulched to keep the pods clean and prevent their rotting. Champion is too tall to be grown without brush or wires, and a second planting of Telephone is therefore preferred, its quality being satisfactory to buyers who object to Marrows. The Aroostook Marrow is much better in quality than the old sort.

BEANS.—The Limas are an impossibility in our short seasons unless started in pots under glass and our trade will not pay for such. Our summer hotels use canned Limas. Our best market pole beans are the Speckled Horticultural, of which we have an extra-early strain, and the Mont d'Or. Of dwarfs for snaps, the Golden Pod Yellow-Eye (the "Golden Prize" of some and otherwise named), is the earliest, closely followed by Purple-seeded Flageolet, the later crop being from the pole, Mont d' Or. Our dwarf shells are Speckled Horticultural for the earliest, and the Boston Favorite, or Goddard, as a succession, the early pole Horticultural, mentioned above, being intermediate. Ferry's Golden Wax was abandoned on account of spotting, as have been many other kinds. Low's Champion is a good bearer and early, but the pods are unattractive, and will not sell alongside of the Crimson-striped Horticulturals.

SWEET CORN.—King of the Earlies and Cory are both planted, and come nearly together. The last has the larger kernels, but the other sells in preference, to those who make much account of quality. In succession, we next have Early Dean and Marblehead coming nearly together, with the same difference in quality; but in this case both size and quality are with the Dean. For later, a second planting of Dean and Moore's Concord, with Triumph for latest, our green corn season almost invariably being closed by frost before the end of September.

CELERY.—The early, self-blanching sorts have the preference. Our market for celery is not large yet, but is growing rapidly.

CABBAGE.—I keep trying new sorts, but my principal crop of late has been Rawson's Early Summer, and Warren's Stone-Mason. As an extra early, I tried, last season, Rawson's Volunteer, but it failed to head well. Jersey Wakefield has not done much with me.

LETTUCE.—Our trade is satisfied with Boston Curled for early, and Hanson for late.

PUMPKIN.—The only kind grown is the small Sugar pumpkin, which is early, very uniform in size, looks and quality, keeps well, and is almost as rich as a squash. It requires no boiling down, and entirely supplants the old field pumpkin for pies.

BEETS.—Egyptian, Bassano, Eclipse and Dewing are all planted, and all liked in their season. Bassano holds its grip well against the darker sorts.

CARROT.—Early Scarlet Horn is grown for market, and for coloring butter; Half-long Danvers for market, and Long Orange for stock. They are easily grown on our light soils, and are usually a profitable crop. Occasionally, when prices are high enough south to surmount our high freights, a few car-loads are shipped.

CUCUMBER.—Early Russian, White Spine and Long Green are the standard sorts. The last is used mostly for pickles: small for green pickles, and ripe for sweet pickles. A few of the long English sorts are grown in heat, but there is not yet a large market for them at a paying price.

POTATOES.—This is a great potato region, and the potato is our chief shipping crop. We claim that we raise, in Northeastern Vermont, as good table potatoes, and as many to the acre, as they do in Aroostook, and we are about 300 miles nearer to the consumers in Southern New England. Many varieties are grown, but at present Hebrons take the lead for shipping. As a market gardener, I find the best profit in growing Pearl of Savoy for early, Polaris for second, and Pecan for long-keeping and spring sales. The last, which is full brother to Snowflake, (the seed being from the same potato-ball), is much like it in looks, but heavier, even better in quality, and it does not seem to know how to sprout until it is put in the ground. Like all potatoes of this class, it must have the best soil and culture to be profitable, and will not be grown much, except for home use, or a fancy trade that will not be too particular about price. Besides the above named, our farmers grow Early Rose, Extra Early Vermont, Early Ohio, Burbank and other sorts, but mostly those that resemble the Rose enough to be shipped under that name. It is to avoid this mixture, I think, that buyers pay extra for Hebrons, which are strictly recognizable.

RADISHES are very difficult to grow here except under glass, on account of the white grub, which attacks them and turnips, and makes them unmarketable, except on newly cleared land. Only the red radishes, short and long, are in demand.

TURNIPS.—There is no more popular vegetable than the turnip, and large quantities are sold, both for home use and for shipping. When they can be grown fair, they pay quite as well as potatoes.

SPINACH.—There is a fair and growing demand for spinach; but buyers do not yet distinguish varieties. The Round-leaved and Long Standing are most grown.

ONION.—This is a leading vegetable with us, and stands next to potatoes and cabbage in area planted. The crop was a good one, the past season, and netted an average of about 80 cents at home, or delivered within wagon distance. Most of the crop is grown near the lake (Memphremagog), where the soil is well suited to it, and the culture is best understood. The main crop consists exclusively of Danvers; but sets and multipliers are planted for an early crop by our gardeners. Early Red is also planted as an intermediate between these and the Danvers. We are all careful to get an early strain of seed for the last, and I have not known the crop to be a failure, near the lake, for many years. As this is a railroad center and county seat, we have a wide market, and the production is increasing rapidly, onions bearing a higher rate of freight than potatoes. But they are not a safe crop in any of the hill country of this section. Our lake is 800 feet above sea level, and the surrounding country is 400 to 600 feet higher.

Orleans Co., Vt.

FROM PROF. E. S. GOFF.

Among the okras, I tested the past season two varieties that pleased me better than any I had previously tried. One was called Little Gem and the other New Dwarf Density. Both were very dwarf and early in maturing. The seeds were planted in the open ground May 23, and the pods were fit for use in the latter part of July, and both ripened their seeds before frost. I have much better success in growing okra by planting the seeds in the open ground than in the hot-bed or greenhouse. The young plants are extremely liable to damp off when started under glass.

In a row containing eight differently named rhubarbs the one bearing the name Scarlet Nonpareil has proved earliest and most productive. As far as I can see, it is equal to any of the others in quality.

Of the squashes I prefer Boston Marrow for autumn, and the Hubbard for winter, both being reliable and excellent in quality. I am not sure that some of the more recent strains of Boston Marrow are not more productive than the old one. I thought, from a single trial made last season, that the Dunlap's Early Marrow and Extra-Early Orange Marrow, both of which differ little from the old Boston Marrow, were rather more productive than the latter, and they were also a few days earlier in maturing.

I was much pleased with the Dwarf Champion tomato the past season. It may not be wise to recommend any variety unconditionally from the experience of a single garden test, but I have thus far no fault to find with it. I was especially pleased with the dwarf habit and hardiness of the plant, and the smoothness and uniform size of the fruit.

Next to our own first early wrinkled pea which takes the premium at our Experiment Station, I consider the Alaska one of the very best for the first crop. I would follow it with a planting of American Wonder or Little Gem, to bridge the gap between it and the Station again for the late crop.

Among cauliflowers I have succeeded best with Henderson's Early Snowball. This has proved satisfactory both for early and late, and in fairly favorable seasons the plants have headed almost as reliably as those of a good strain of cabbage. As a rule, I am not in favor of using seedsmen's names in connection with varieties, but in this case the name seems to bear some merit, at least other Snowball cauliflowers have not headed so well.

For early celery I still adhere to the White Plume. It is slightly strong in flavor and a little hard unless it is banked up; but the ease with which it is grown and its attractive appearance compensate for these defects. For use after Christmas, I am much pleased with the Golden Heart Half-Dwarf. This variety keeps well, and is excellent in quality, and its delicate creamy tint is very pleasing.

For earliest cabbage I have found nothing to equal the Early Wakefield. In a careful comparative test, this variety equaled the Etampes in earliness; while the heads were slightly larger and rather more compact. For medium I have found nothing superior to Fottler's Brunswick, and for late, Premium Flat Dutch and Late Drumhead have proved as reliable as any.

For an early out-door lettuce I am much pleased with the Black-Seeded Simpson. It is a very rapid grower, attractive in appearance and of excellent quality. For summer I like the Buttercup best. For the past two seasons I have had a bed of several different varieties growing in the garden, and the Buttercup has continued fit for use rather longer than any other; while its table quality was the best of

all and its delicate yellow color is most attractive.

For pies I have found the Mammoth Red Etampes pumpkin much superior to the common yellow field variety. The flesh is richer and more meaty, cooks more quickly and is less stringy. This variety keeps till about Christmas in a cool cellar.

Of the varieties of celeriac that I have tested, the Apple grows most regular and uniform in size. Celeriac is too little appreciated. It is as easily grown as cabbage, may be kept throughout the winter, and is surpassed by few other vegetables in flavor.

Of the egg-plants the Extra Early Dwarf Purple is decidedly the earliest and most productive variety I have grown. It may be depended upon to mature a large crop every year. The fruits are small, but I do not know that they are inferior in quality to the larger varieties.

The spinach known as Viroflay is decidedly more vigorous than other varieties when grown on very rich soil. I regard it as one of the best. The Long Standing is also excellent and is especially late in running to seed.

I have been much pleased with the Early Albino potato. It has proved very early, excellent in quality and as productive as other early varieties.

Geneva, N. Y.

FROM FRED GRUNDY.

RHUBARB.—I have found it best to open a trench 18 inches deep, and about the same in width, fill to within six inches of the top with well rotted manure and fine soil mixed and trampled down; on this I place large pieces of roots, having one strong bud, three feet apart, and cover with good mellow soil, rounding it up in a ridge. This ridge will settle four to six inches and cultivation levels the surface. Planting is done as early in the spring as the ground can be worked. The soil is kept mellow and free of weeds with cultivator and hoe, and the plants make a rapid growth. Late in the fall they are covered with six inches of strong manure, which is raked aside early the following spring. Rhubarb sells well and brings a fair price very early in spring. The demand ceases when strawberries begin to come in. Two *good* crops of *large* stalks are all I expect from one planting. In the rich, mellow soil of river bottoms it is not necessary to trench and manure as I do. The variety I first set out was called Linnæus, and I have used the same stock ever since. Once I grew a large number of seedlings, but not one proved superior in any respect to my old stock. I have also tried some of the highly lauded new (?) varieties and found them so nearly like the old that only an expert microscopist could detect the difference. Only the richest of rich soil will make large rhubarb.

PEAS.—Every seedsman has the earliest pea for sale, and he names it to suit his fancy. It may be "First and Best," "Lightning Belle," or simply Dan. O'Rourke, but it is the same pea all the same. The ground is plowed in the fall, harrowed smooth as early in the spring as possible, furrows two inches deep and three feet apart are drawn out and the peas are sown with a hand-drill, and covered with one inch of soil. They can be sown too early. Nothing is gained by sowing them in our soil before spring fairly opens, or before the ground is entirely thawed out. I have lost several sowings by rushing the season. The wrinkled varieties are sown when the ground is somewhat warm. They are cultivated almost exclusively with an A-harrow and light cultivator. For earliest, the Extra Early, or something to that effect, is best. American Wonder and Premium Gem do very well for second, and they take up little room. For a late pea to eat I like Champion of England. It must have plenty of room, frequent cultivation and *high* brush to climb on. I have seen it in Minnesota fully seven feet high and yielding good pickings until frost.

BEETS.—I grow only Early Blood Turnip. It is ready to sell as early as any beet grown, and, what is better, it is *smooth* and easily cleaned. The ground is enriched in the fall, plowed, harrowed and fined with a plank drag in the spring, and the seed is sown with a drill in rows five inches apart. The plants are thinned to about four inches apart at the first weeding. Cultivation is done with hoe and steel rake. I tried a wheel cultivator one season and dropped it.

CARROTS—Land is prepared as for beets, and the seed is sown at the same time and the cultivation is the same, except that it is continued longer. Stump-rooted sorts are best because easiest to dig, handle and store.

ONIONS.—Of these I grew hundreds of bushels some years ago. I grow but few now. The Yellow Globe Danvers yields well and sells best of all. The preparation of the ground and cultivation are the same as for beets. The seed must be got in early or the crop will assuredly be failure. Onions must get most of their growth before the hot, dry winds of July strike them and cut short their career.

SQUASH.—For summer use I plant the Summer Crook-Neck; for winter I use the Perfect Gem. Some people do not like the Gem, but ten of it are sold for one of any other variety. There is a vast difference in the flavor of Gem squashes. Some of them taste like a water-logged sweet potato; others are stringy and tough, and still others have a sickly sweet flavor. It must be brought up to the eater's standard by careful and continued selection. I tried Boston Marrow one season and had the pleasure of feeding the crop to the cows. I plant squash seeds, at the same time I do corn, in hills five feet apart, 10 seeds to the hill, and the ground is kept loose and free from weeds with the cultivator, which is always run the same way when working among Gems. The plants are thinned to four to the hill when they get two rough leaves, and when they are ready to take complete possession of the ground cultivation ceases. Striped bugs are the worst enemies of squashes. They will destroy every plant in two days if not checked. A thin mixture of fresh cow-dung and water, sprinkled over the plants with an old broom, has always proved effective.

TOMATOES.—I have tried 15 or 20 varieties and settled on Acme. Favorite, Beauty and Perfection rotted badly. Others are objectionable in size, form or color. Acme has always done well. The plants are grown in boxes under glass, hardened off and then set three feet apart in rows four feet apart, and cultivated the same as squashes.

BEANS.—I grew two good crops of Navy beans when this country was new, and before the weevil arrived. When that pest came he came to stay, and he destroyed the bean-growing business. For snap beans, Black-seeded Wax gives the best satisfaction. The cultivation is the same as for early peas. For pole beans I plant Large Lima, one good bean in a place, eye down, one inch deep, and two feet from the next. A small pole is stuck by each bean, and three of these poles are tied together at the top. It takes quite a cyclone to overturn them when the vines have climbed up.

SWEET CORN.—Moore's Early is good for first, Evergreen for second. Some other varieties mature a few days before Moore's Early, but the ears are too small. The past two seasons I have started 30 to 40 hills under glass in pint berry-boxes filled with rich soil. When danger from frost was over, these hills were set out close by the earliest outside plantings, the sides of the boxes being simply broken down and mellow soil drawn around the plants, which were three to four inches high. The roots were not disturbed in the least, and the corn grew on without a check. Last year, corn started in boxes was ready for eating six days before the first from outside planting. Two years ago the former was ready eleven days before the latter. I plant all sweet corn two feet apart in rows three feet apart, two to three grains to the hill, and cultivate with the horse.

CABBAGE.—Early Wakefield is my choice for early, Henderson's Summer for second early, and Premium Flat Dutch for late. Plants of the first two are started in boxes under glass, hardened off and set out as soon as the ground is ready. Flat Dutch plants are grown in the open ground and transplanted early in June. Early cabbage generally does well. Late cabbage is not always a blooming success owing to cabbage worms and drought.

CUCUMBERS.—I prefer White Spine for slicing and Early Russian for pickles. There is not much demand for either. Cucumbers are grown like squashes.

TURNIPS are generally grown on oat ground, which is plowed and prepared in the latter part of July. Red-Top Strap-Leaf is the favorite. The roots sell at 10 to 25 cents per bushel.

MANGELS.—Yellow Globe is decidedly the best. The ground is prepared and the seed is sown the same as for beets. The rows are three feet apart, and cultivation is done with hoe and cultivator. The seed must be got in early, or not half of it will ever grow.

POTATOES, like most other vegetables, must be planted early to insure a crop. I grow early varieties exclusively. Late succeed about once in five years. Beauty of Hebron and Early Ohio seem to do best and yield very good crops. I tried the trench system once, but was obliged to earth up some to save the tubers that were exposed by heavy rains. I shall try it again. It is best to plow the ground in spring as early as it will turn up mellow. It is worked down fine; shallow furrows are made three feet apart, and large seed-pieces, cut the same day, are dropped 15 to 18 inches apart and covered with two inches of mellow soil. When the first weeds appear the ground is curried over with the back of a harrow which puts a quietus on them for a couple of weeks, and by that time the plants are large enough for the cultivator. But little hoeing is done, it is cheaper to use horse implements early and often. Beetles are treated to a solution of London-purple.

FIELD CORN.—The two varieties of field corn most extensively planted in this great corn region are yellow and white. There is great diversity of opinion as to which is best. With good soil, thorough cultivation and a favorable season, either will yield a good crop. If planting yellow, I would select the pure quill—perfectly yellow, with a large deep grain and small red cob. If white were my choice, I would select pure white, large deep grain and white cob. Continued careful selection, aided by rich soil and good cultivation, will do wonders with corn The best bred and most wonderfully named corn on earth will rapidly deteriorate when grown on poor soil or only half cultivated. If the soil is rich and strong we put four to five grains in a hill. If it is somewhat run down two to three are sufficient. We begin to cultivate as soon as the corn is planted, and keep at it until the plants are two feet or more high. I never saw corn that was cultivated too much or too often. Three to four inches are deep enough for any corn cultivator to run. When the farmer comes out of his corn-field to hang up his cultivator, he should leave the corn at least two feet high, the soil perfectly loose and mellow to a depth of four inches, and not a weed visible. The thread-like feeding roots of the plants will then take entire possession of the soil, and the growth will be rank and rapid.

NOVELTIES.—Not one in 50 is better than the old varieties. I expend about a dollar a year on them, for amusement mainly. If they are valuable they will remain on the lists and become cheap in due time. If not, they will disappear.

Christian Co., Ills.

FROM H. L. WYSOR.

It is only within a period comparatively recent that the business of market-gardening has assumed any noteworthy proportions in this section of the State. Owing to the fact that there was no market for vegetables, the country was given up to the raising of stock, which, requiring little outlay in labor or other expense, gave very profitable returns up to the time of the severe decline in cattle. Since, however, the development of our iron industries, the building of furnaces, the opening of mines, etc., the area devoted to growing vegetables has been yearly increasing to supply the demand for them occasioned by the large number of laborers employed in these works. For some kinds of vegetables—such as rhubarb, egg plant and squash—there is still no market, and these kinds are not grown. The following, however, are grown here to a considerable extent.

BEANS.—For snap bush beans no kind surpasses the Early Valentine, and none equals it in quality. The wax sorts are productive, but spot badly in wet seasons, and are without any pronounced flavor. As compared with green beans, they are tasteless. For dry beans, the Navy or Pea bean is grown almost exclusively. It is generally sown broadcast, no cultivation being given, and it is harvested with the reaper. Some yields have been reported as high as 25 bushels per acre. Pole beans are planted with some of the taller field corns as a support. The Southern Prolific is the kind mostly used. No Limas are grown except for home use.

BEETS are raised to a very limited extent. The Blood Turnip is the best and sweetest.

CABBAGES are more largely grown than any other vegetable, principally for Southern markets. Till this season they have been far more profitable than tobacco in the eastern part of the State. Owing to the great drought in the West in 1887, such profits were realized from sales of cabbages here that a large increase in area was brought about in 1888—no less than 6,000 acres are said to have been planted in Wythe county, alone. Consequently they were a drug in the market, in many instances shippers having to pay the freight. The Flat Dutch is the kind usually grown, and it is the best adapted to this climate. One of the best late cabbages I have ever grown is the Hard-Heading introduced last year by Gregory. It is very hard and heavy, seldom bursts or rots, and keeps remarkably well. It will, no doubt, be largely grown here when its merits become known. In growing cabbages here fertilizers are largely used. They are placed in the hill when the seeds are sown. The area is too large for the economical use of barn-yard manure, even if it were to be had in sufficient quantity, and for the same reason no transplanting is done. The seeds are sown in checks 2½ feet each way, giving nearly 7,000 hills to the acre. The plants are dusted with ashes or plaster to prevent the attacks of the flea-beetle, and are thinned when out of danger, "missing" hills being filled at the same time.

CORN.—The Leaming is the best I have ever tried, and is now largely grown for stock, yellow corn meal not being palatable to Southern taste. It has a comparatively large cob, which is, however, light and pithy, drying out readily and rapidly without spoiling the grain On further trial, the Brazilian Flour corn proved to be utterly worthless except as a forage plant. The [illegible], of which the yield is not great, dries so slowly and is so soft that it spoils in curing. Of sugar corn for a succession, I prefer the Cory, Early Concord, Stowell's Evergreen, and Late Mammoth.

ONIONS.—The potato onion is almost exclusively grown throughout the State. It is set out in the fall—in November—is protected by a covering of pine brush or other coarse litter, and is harvested in July. Onions from the black seed are not to be relied upon here. I have, however, frequently succeeded with the Large Red Wethersfield sown early in the spring. It is the best keeper of all, though of rather strong flavor. The Italian onions are such poor keepers that they are not worth planting. They begin to grow again almost as soon as matured.

POTATOES.—Early Rose is still the leading early variety and commands a higher price than any other in our markets. I have always regarded it and its class as tasteless, but it seems to suit the popular idea, being dry and mealy. I myself grow potatoes largely for market, but do not plant early varieties as the late kinds are more productive and are better keepers. For some years I have planted the State of Maine, which, as the RURAL is aware from its own tests, is a very heavy yielder. [Yes, it is a fine variety.—EDS.] It is smooth, of good shape, and seldom knobby. It is better adapted to level cultivation than any other, since it never grows out of the ground to become sun-burned. An objection to it is the scattering habit of the tubers. I tried, last season, Rose's Beauty of Beauties. The name is a misnomer. There was not a single potato in the peck which I purchased that was not ill-shaped. In my soil it has become much smoother; but still it does not come up to my idea of a beauty. The tubers are few, but average very large, and the quality is excellent, fully equal, if not superior to that of the old Peachblow. My plan of planting is in rows 32 inches apart, and two-eye pieces are drilled in 12 inches apart. In cultivation, the ground is kept as nearly level as possible and free of weeds until covered by the vines.

PUMPKINS are grown in the standing corn. The large Cheese is the best, being thicker-meated and of better quality than the Connecticut Field. Pumpkins are grown for stock—principally milch cows.

Pulaski Co., Va.

FROM H. M. ENGLE & SON.

Potatoes are not confined to the garden; but what farmer's wife will not have some planted in the garden so as to be sure to have some for the table in advance of any of her neighbors. The same rivalry applies also to peas. The variety that matures first is, of course, selected, and in this there is a wide difference of opinion.

We have thus far found no potato that has matured earlier than the Early Ohio. Side by side, we have grown Early Rose, Early Maine, Early Vermont, Early Beauty of Hebron and others. The Early Ohio can be planted closer than any we have yet tried, and has in some seasons yielded more than the Early Rose. Moreover, it does not sprout in the cellar as soon as the latter, and in quality it is about equal. We do not plant medium crops, as they generally mature in the hottest part of the season, which is not congenial to their nature. We plant the early varieties as soon as the weather and soil will permit, so as to have them mature before heat and drought set in. For the later varieties we calculate their period for maturing, and plant so as to extend their season as nearly as possible to the first frosts. In such a case they rarely fail to get the benefit of the fall rains and cool weather, thus securing, almost without fail, good crops. For late crops we have been growing Peerless and Mammoth Pearl—which are almost identical—White Elephant, White Star, Burbank, Snowflake, Peachblow and others; but the Peerless and Pearl have given us the best satisfaction.

PEAS.—Almost every seedsman has the earliest with his name prefixed, and the difference is so little that we have no choice. For succession, we grow McLean's Advancer which combines about as many good qualities as any we have yet tried. The pea is of the

best quality and the vine is productive, and of medium hight.

BUSH BEANS.—Early Six-Weeks has no merit except earliness. Black Wax is but a little later, and is showy and of good quality. For succession, the old Valentine will not be soon crowded out. For pole the Giant Wax is still a favorite. There has not been much improvement on a good strain of the common Lima. Dreer's is not popular here, as it is hard to shell.

SQUASHES.—The White Scalloped Bush for earliness will no doubt hold its own for some time. For quality, Perfect Gem has no superior. Boston Marrow, Hubbard and Marblehead still remain favorites, though many excellent varieties have appeared since their introduction.

TOMATOES.—Among the many varieties we have found none superior to Livingston, Paragon, Favorite, Perfection, Beauty and Acme. The last is unexcelled for quality, but it is rather tender for shipping. From the former varieties we have by careful selection secured a strain that we believe to be unsurpassed, and consequently we buy no seed except for testing.

CELERY.—We have tried many varieties, but have found nothing that suits us better than Golden Dwarf. We grow some White Plume for early, and some red for the best quality.

CABBAGES.—The best strain of Wakefield is as yet unexcelled if equaled for early. Large Wakefield and Early Summer are prime for medium, and the best strains of Flat Dutch for late.

CAULIFLOWER.—Snowball, Erfurt and Long Island Beauty are all fine.

BEETS.—Egyptian and Eclipse for earliest, Early Blood Turnip for medium and late can hardly be surpassed.

CUCUMBERS.—White Spine for slicing and Green Prolific for pickles are our choice. The latter is exceedingly productive.

EGG PLANTS.—Good strains of New York Improved are as yet unsurpassed. Black Pekin is a trifle earlier, but it is not a profitable market variety.

CARROTS.—Early Horn for earliest, and Improved Long Orange and Half-long Red for the main crop have given us best results.

RADISH.—For forcing, we prefer Early Scarlet Turnip to French Breakfast, Olive-Shaped or any others, as it does not get spongy so soon. For out-door culture Long Scarlet, and Beckert's Chartier, and for winter Rose China.

TURNIPS.—Early Purple-Top Strap-leaf for early and White Globe for late are our preference.

SPINACH.—We have tried several varieties, but have settled on the Savoy-leaved varieties as being the hardiest, and of the best quality.

ONION.—Yellow Danvers is the best for bulk of crop. Silver-Skin is more salable, but it is not a good keeper. Extra Early Red is our best early variety.

CORN.—There are so many varieties of sweet corn claiming first honors for earliness as almost to confuse the inexperienced planter; but they bear almost invariably small ears. Of this class we grow a small percentage; but for several years we have selected Crosby's Early as the earliest that will produce ears of good size. For the main crop or succession we consider Stowell's Evergreen the best. It combines more good qualities than any other.

Lancaster Co., Pa.

FROM A. B. COLEMAN.

There are so many good vegetables that it is difficult to say which are the best. Many of the old varieties are about as good as any of the much lauded new kinds, if not better. Our seedsmen seem to have contracted a mania for the introduction of new varieties of vegetables, whether they are meritorious or not. The catalogues give us something new every year, at a high price. Now and then we stumble upon a novelty which proves a little better than anything of the kind we have before struck; but, more frequently, than otherwise, we pay out 25 cents per packet and get something altogether inferior to a five-cent packet of an older variety. New vegetables, new fruits, and new implements are desirable if they possess special merits; otherwise they should never be thrust upon a confiding public with such high-sounding, eulogistic, and, it may be said, false descriptions, simply to fill the pockets of the introducers. The introduction of a new bean, tomato or melon does not always carry with it the assurance that the novelty is, in all respects, superior to anything of the kind ever catalogued. As often as otherwise, the newcomer is, in all respects, inferior to many other varieties which preceded it many years. It is best to touch new things lightly, unless the testimony of their superiority is indisputable, and unimpeachable. The following vegetables have proved about as valuable here as any ever tried in this section for field culture.

BEANS.—Early Valentine, Early Mohawk, and Refugee are my selections for bush varieties. Sow them in drills 2½ feet apart. Drop the seeds from five to six inches apart—(many plant closer), cover an inch and a-half. The soil should be well fertilized. Give level and shallow cultivation after every rain. For pole beans I prefer Horticultural, Southern Prolific, Dutch Case-Knife, Southern Crease Back, Red and White Cut-Short. The last three are excellent varieties and are planted almost exclusively here in corn-fields, where they do splendidly. When poles are used, drill in rows four feet apart, and drop the beans 15 inches apart. Cultivate as for bush beans, and when the vines are 10 inches high stick a pole seven feet high in each hill. Sieva or Small Butter does better here than any of the Limas. It is enormously prolific and early, and bears until frost. These beans are planted and cultivated as ordinary pole beans. Some, however, make a trellis for them as for grapes, and plant in the same place for several years. Beans should not be planted until the ground is fairly warm, as they are quite sensitive to cold. The Navy and White Kidney are grown here almost exclusively for winter use.

BEETS.—Extra Early Egyptian and Bastian's Early are as good as any. Sow them as early as the ground can be worked, in rows two feet apart. Thin them out to four inches apart. Use those pulled out for "spring-greens." The soil should be very rich. Give level surface cultivation.

SWEET CORN.—Early Minnesota and Stowell's Evergreen are the favorites here. I have never regarded sugar or sweet corn as making the best roasting-ears, and I have never grown this kind extensively for this purpose. A good variety of field corn, to my taste, makes a better, more palatable and more substantial dish than any sweet corn I have ever tried. For such a dish, I do not know of anything better than Pride of the North. I have been using it for roasting-ears ever since its introduction by the late Hiram Sibley. It is very early, prolific and fine-flavored, while the ears are of good size. It makes a choice pudding. It should be planted for a succession.

CABBAGES.—Hereabouts we prefer Early Jersey Wakefield, Henderson's Early Summer, Fottler's Improved Brunswick, Premium Flat Dutch or Burpee's Surehead. For the early varieties I sow seed in hot bed or cold-frame in February and set out plants as soon as they are large enough, 2½ feet by 18 inches apart. For late cabbage I sow the seed in April and plant in May or June, three feet apart each way. Give level cultivation, keeping the surface stirred after every hard shower, so that the loose surface soil may act as a mulch and preserve the moisture. This is a crop that will not materialize on thin land. The soil must be rich—very fertile Good loam, well-drained, but inclined to moisture, is the best. The cabbage is a heavy feeder and drinker. It requires an abundance of plant food and water. Good composted stable manure is the best fertilizer I have ever tried for this crop. The following preparation is the best preventive of the cabbage worm: Take an ordinary coal-oil barrel and fill it two-thirds full of water, and stir in it a gallon of coal or gas-tar. Mix it thoroughly. Let it stand three or four days, stirring every day three or four times. With a garden sprinkler put a little of this mixture on each plant. It should be applied once a week, about the time of the first appearance of the cabbage fly.

CUCUMBERS.—Nichol's Medium Green for table, and Green Prolific for pickles are my choice. Plant five feet apart in good soil and cultivate until the vines cover the ground.

SQUASH.—Summer Crook-Neck for summer use, and for winter use I would substitute the Sweet Potato pumpkin which is about as good as the winter Squashes, besides being very prolific, a fine keeper and a sure cropper. It is not disturbed by the Squash-bug. Plant seven feet apart each way.

POTATOES.—Early Rose and Potentate for early use, and Mammoth Pearl for medium or late, can't well be excelled.

TOMATOES.—I have never grown any better sorts than Essex Early Hybrid and Optimus. They are early, of good size, smooth and of fine quality and prolific. Set the plants four feet apart each way, in good soil. Put a teaspoonful of salt in each hill and mix it thoroughly with the soil. Drive a stake five feet long in each hill, and tie up the vines as they grow.

FIELD CORN.—I prefer Mammoth Cuban, yellow; Gould Hill Prolific, white. Mammoth Cuban is a very early yellow dent variety, very prolific and is practically drought-proof. It is the best corn with which I am acquainted. Its feeding value is unsurpassed. The Gould Hill Prolific is a large pure white corn said to be a cross between Blount's Prolific and Mountain Giant. It has a large grain, large ear and large stalk. It makes the very finest snow-white meal. It is the most prolific white corn I have ever grown. Plant the seeds from three to four and a-half feet each way according to the size of the stalk; or drill in rows three to four and a-half feet apart and thin to one stalk every 15 or 20 inches. Thorough preparation of the soil is absolutely essential to make a good corn crop. Level, surface cultivation should by all means be practiced. If I could do so, I would cultivate my corn after every heavy shower, just deep enough to effectually break the surface crust, and put the soil in condition to absorb and radiate heat and not reflect it. The reflection of the rays of the sun from a hard, glazed surface soil, is fatal to any growing crop, particularly corn. Shallow cultivation after every hard rain will break up this reflective condition of the soil, and, besides, the stirred surface will act as a good and effective mulch to prevent the rise and escape of moisture. These shallow cultivations may be continued with profit until the corn is in the roasting-ear state. Plowing the corn from five to 10 inches deep, in deep cultivation, multilates and tears the roots to pieces. All cultivation should cease before the corn is a foot high. Corn roots should never be disturbed by cultivation; but if they are to be wounded at all, let it be done when the corn is small.

Caldwell Co., Ky.

FROM JONATHAN TALCOTT.

RHUBARB.—Victoria suits me as well as any; yes, rather better.

SQUASH,—summer, Yellow Crook-Neck; fall, Essex Hybrid; winter, Hubbard.

PEAS.—Bliss's American Wonder for early; McLean's Advancer, for second early; Champion of England for late. Plant at different times for succession.

CABBAGES.—Early Winningstadt is an excellent sort for family use, but for sale, a Drumhead is preferable. Gregory's All Seasons is a good sort for me.

PUMPKINS.—The common field pumpkin, generally called Connecticut Pumpkin, suits me best.

BEETS.—Bassano has been the standard, but some of the darker sorts are now preferred.

CARROTS.—The Danvers is my choice.

CUCUMBERS.—White Spine is my favorite.

ONIONS.—Yellow Danvers.

BEANS—For white I prefer the Mountain Bush or Marrow; for string, the Golden Wax. I do not raise pole beans.

CORN.—Early Minnesota I like best for early; Moore's Early Concord for medium, and Stowell's Evergreen for late. Use a succession of plantings.

TOMATOES.—Rawson's Puritan.

FIELD CORN.—Dutton.

MANGELS.—Globe.

BEANS.—The Speckled Cranberry for a pole variety is best with me.

Oneida Co., N. Y.

FROM F. H. VALENTINE.

Any list of garden vegetables which I might select from positive knowledge would not include many varieties of most recent introduction, for this reason: When I first began gardening I studied the seedsmen's catalogues intently and, in my innocence, was carried away by the glowing descriptions of their wonderful new varieties. I was led to buy many seeds at exorbitant prices, only to find afterward that many of them were no better than the old varieties which were sold at moderate rates, if, indeed, some of them were not identical. To be sure, I got some good things among the novelties, but my ardor was cooled to such an extent that I have invested very sparingly of late, preferring to let others bear the expense as well as the disappointment of a trial. I can recommend the following as good in our locality, although other varieties may be as good, or even better.

PEPPERS.—The Golden Dawn Mango is the best I have tried. I like its yellow color, and it is not so fiery as some of its more ruddy relatives. Peppers must have a warm, rich soil, must be kept in a hot-bed until the weather is quite warm, and should be of good size, even in blossom, when transplanted.

RHUBARB.—Linnæus I find as good as any. It should have a warm exposure to bring it on early in spring when we need it most. Half a barrel set over the hill, and surrounded with fermenting horse manure, as soon as the ground is bare, will push it on several days.

SQUASH.—I like White Scallop best for a summer variety, although some prefer the yellow ones because they "look better." The W. S. is a little earlier than the Crook-Neck, and is good in the fall after the shell hardens. Mix well-rotted manure in the hills, hoe often, and sprinkle with a weak solution of Paris-green to kill the bugs. This is a good remedy for bugs on all similar vines; but needs to be about half as strong as for potatoes, to avoid injury to the vines. The Hubbard is good enough for me for a winter squash. Plow under all the manure you can, no matter how coarse, plant in hills ten feet apart each way, or in drills 10 or 12 feet apart. Rotten manure in the hill won't hurt the squashes. They are excellent for stock, producing very rich milk, and can be grown very cheaply. Farmers should grow them more extensively for this purpose. As they yield heavily, much valuable feed can be grown on a small area. Handle very carefully those stored for winter, as they will decay if bruised, store only the hard-shelled ones in a dry cool place, and they will keep for a long time.

TOMATOES.—I would plant some of the Golden Queen for home use, on account of a preference for its flavor, and also because it makes a pretty contrast to the red varieties. The Mikado is early, large, very productive, but very irregular in shape. There is not much choice between Essex Hybrid, Cardinal, New Red Apple, and Livingston's Favorite, excepting, perhaps, that Essex Hybrid and Favorite do not rot quite so badly here. I have tried the Station, originated at Geneva, but it is no earlier or better with me than the older varieties, while it is smaller. I don't take any stock in "tree tomatoes" so liberally puffed by some seedsmen. Do not transplant tomatoes until the ground is warm, even though it be the middle of June. They will not grow when it is cold, and serve only as food for the omnipresent Colorado beetle. Plant a few potatoes nearby beforehand to have them ready for "bug feed." A trellis for tomatoes will pay in securing both early ripening, and exemption from rot. A good hot-bed made the first week in April, will give plants quite large enough for transplanting as soon as the weather is suitable.

PEAS.—For early, plant Carter's First Crop; for medium, Premium Gem; for late, Champion of England. Plant early ones shallow, and late ones deep. Plant in drills at intervals of two weeks.

BEANS.—I wouldn't plant bush varieties for my eating as "snaps," although they make good succotash. The Golden Dwarf Wax I call the best. Different seedsmen give a half-dozen variations on the "Wax" bean, but they are all practically the same. The Golden Butter Pole is incomparably the best bean I ever saw. It bears early, and holds out late large, beautiful, translucent pods, which are very tender and sweet for snaps. This is the only variety I would raise for green beans for my own use. Do not plant beans too thickly, or hoe them when wet.

CORN.—The Cory is the earliest I have yet found. The ears are large and sweet for so early a variety. A little sugar added to the corn while cooking, will improve it, and the same is the case with early peas. For second early, Perry's Hybrid is the best. It has very large ears of 10 or 12 rows, and is quite tender and sweet. The greatest objection to these two varieties is their red cobs, but this feature can be bred out by care in selecting seed. For late, the Mammoth is the sweetest corn I have ever tasted. It is later than the Evergreen, and has much larger ears. If these three varieties are planted at the same time as early as the ground is warm, they will furnish a succession lasting a long time. Plant some Mammoth early in June for late use, and for winter use also, according to some late writers in the RURAL.

CAULIFLOWER.—The Early Snowball forms the most solid and best heads of all I have grown; it is good both for early and late.

CELERY.—I am much pleased with Early Arlington, which is an improved Boston Market, but several weeks earlier. White Plume is an early sort, and is very ornamental, but it is a poor keeper. The red varieties are coming into favor, but I have never tried any of them.

CABBAGES.—Extra-Early Wakefield has always been my standard early sort, but last season I tried New Express, and was so well pleased with its good quality, its solid heads, which stood long without bursting, and it good size, that I shall plant it again for extras early. For intermediate and late, I would plant All Seasons and Fottler.

LETTUCE.—Prize Head and Hanson furnish all the variety I care for. They are both tender and sweet, and without that bitter taste so often found. Sow some in a hot-bed for early use.

PUMPKINS.—Connecticut Field makes pie which is good enough for me.

BEETS.—Eclipse for an early "bottoms" very rapidly, and is of good quality. Sow thickly, and thin out for "greens." For the main crop and winter use, the Bassano cannot be beaten.

CUCUMBERS.—I like Tailby's Hybrid better for the table than any other variety I have tried. It is very productive, solid, and fine-flavored. For pickles I grow Green Prolific on account of its prolificacy, and good keeping qualities, although an occasional customer complains that it is "too chunked."

EGG PLANTS.—I never grew any but once when I planted New York Improved Purple, and had nearly as many different kinds as I had plants. I wouldn't take the trouble of keeping the beetles off the plants for all the satisfaction I could get by eating the fruit.

POTATOES.—The Early Maine is about as early as any, and is of good quality. Beauty of Hebron is a fine potato for a general crop. It is of good quality in the fall, and keeps solid and good through the winter and spring. The New Queen under very unfavorable conditions, did so well last season that I shall try it again.

RADISH.—The Scarlet Turnip White Tip is a very nice early sort, crisp and tender. It can be raised very early in a cool hot-bed. Long Scarlet for later, is a most excellent variety. The Shepherd was a complete failure with me, while a neighbor called it the best radish he ever ate. Radishes *must* grow quickly to be tender.

TURNIP.—Yellow Swede is the only variety I would grow for my own use. For best quality, sow rather late, so as to insure rapid growth. The roots will be better if only of medium size. Those who want a quicker-growing variety, and also one which may be sown later, will find Purple Top Strap-Leaf or Purple Top Globe very good varieties, though they are rather watery when cooked.

Wayne Co., N. Y.

A FARMER'S GARDEN.

A good garden is little appreciated by the average farmer, yet nothing on the farm is so valuable in all respects in proportion to the labor and expense as a well selected, well kept garden. Profit, pleasure and health may be realized and promoted by it. After the location has been determined, drainage becomes a matter of the first importance. If natural drainage is offered by the lay of the land, nothing more will be needed; but if this is not the case, tile drainage should be employed. This would be the most perfect and would secure the best possible results. Aside from making the ground dry, it will have the effect of making it ready for use probably two weeks earlier than if it were not drained. This of itself would constitute a very great advantage. The very first thing that ought to be done after the ground has thawed out, is to sow or plant those garden vegetables that are not easily affected by frost or freezing, such as beets, lettuce, peas, radishes, cabbage, onions and spinach, and as early as possible all the other vegetables should be put in, such as sweet corn, beans, tomatoes, turnips and others suited to garden culture. Every garden should have a bed of asparagus. Nothing is more valuable, palatable and healthful, coming, as it does, the first *thing* in the early spring at a time when the system and the appetite demand and crave something of the kind, which is a departure from the winter living. A bed of rhubarb also is a godsend and both of these should always be found in such abundance as to supply the requirements of the family. Yet how seldom are these "luxuries" found in the farmer's garden, and how insignificant is the outlay necessary to obtain plenty of them! When once possessed, they prove a permanent blessing, and this is an additional reason in favor of at once deciding to obtain them. It is important to secure the best seeds of the very best varieties of every thing for the garden. An inferior article is dear as a gift as compared with the best at its just value. Very great advances have been made in recent years in the improvement of all garden vegetables and fruits. When the best seeds of the best varieties are obtained, it is a good plan to plant a portion of each kind for the production of seed, giving wider distances to these than to the seeds for the ordinary crop. In this way the seeds are improved. Successive plantings should be made at intervals of sufficient length to have a supply continually. Especially should this be done with the leading and most desirable kinds. Fruits of all kinds suited to garden culture should belong to the farmer's garden.

Enlightenment, civilization, refinement and a first-class fruit and vegetable garden go hand in hand.

After growing the seed in the best manner—giving extra space, care and attention to the plants that are intended for seed-bearing—it should be properly cared for. Get a sack of sufficient size to hold all the papers of seeds, and when it has been filled hang it up in a safe and dry place. Get as many small paper sacks as may be needed—these can be had at the grocery-store—save the seeds when fully mature, and dry them carefully in the shade, and pack them in small paper sacks, marking on the sack the kind of seed and the time of saving it. This mode of caring for the seeds will be comparatively inexpensive, and will preserve them in good condition. If the best seeds of the best kinds are obtained at first, and proper care in growing them is given, and home-grown seeds are carefully saved, the quality and yield of the crops will improve each season, for the law of improvement requires us to choose the best kinds and give them the best care and culture.

Our enterprising seedsmen are constantly bringing out new and desirable varieties of vegetables, and it is the best economy to obtain seeds of the new kinds, and not only preserve but increase their good qualities, by careful growing. It is important that the seeds should be on hand in good time for early planting. One week's enjoyment of fresh vegetables and fruits, as early as it is possible to have them, is worth as much as two weeks' enjoyment of them in the middle of the season. It is therefore of the first importance to plant early.

The garden should be well plowed in the fall, so that no time will be lost in the spring, yet it would be well to give a shallow plowing in the spring also, and a thorough preparation for the seed by several harrowings until the soil is made perfectly fine. No part of the work is more important than this. It facilitates planting and enables the roots to take hold, and gives the plants a good send-off, which is essential to the most perfect growth. The plowing in the fall should be deep and the furrows narrow, leaving a portion of the bottom soil at the top, and a portion of the top soil falling below. In this way the soil may be deepened and made rich, making it much more valuable for the production of all garden vegetables and fruits. By breaking up the top soil deep and keeping the surface fine and mellow, the best conditions will be secured for the attraction to the surface of plant food and moisture from great depths in the earth, and for obtaining a supply of plant food from the air, which is a reservoir of fertility. Thorough culture of the garden is of great importance. Frequent culture will insure moisture in times of drought, and is valuable at all times for supplying mellowness and moisture to the soil for the use of plants. One of the reasons why many farmers pay little or no attention to having a garden is the fact that so many attempt the cultivation of more land than can be well tilled; the consequence is that they are compelled to give all their time to ordinary farm work, and have no time to make a garden. The ecomony of this course may well be doubted. The better way would be to attempt no more than can be done in the best manner, and in determining this question, one should allow the garden to come into the account.

Scott Co., Iowa. E. S. TEAGARDEN.

FROM O. H. ALEXANDER.

PEPPERS.—Taking all things into consideration, I prefer the Bell or Bull-Nose variety. It is a large, early sort, of mild flavor. It is the best for pickling. The new Celestial kind is also good for pickling. Peppers need rich soil. They succeed nicely on fine clay loam.

SQUASHES.—I prefer the Sibley for quality, though in Vermont this kind is not so productive as the Hubbard.

TOMATOES.—I prefer for this section for early, Laxton's Early. The vines are completely loaded with fruit, and I am confident that whoever wishes an early tomato will be much pleased with this. The quality is rather inferior to that of our American tomatoes. I value it for Vermont, because it is early. I find Livingston's Beauty and Autocrat fine varieties for our climate; so is the Optimus.

BEANS.—The new Golden-Eyed Wax is the best and most prolific variety of bush beans that I ever raised. I raised this year 1¼ bushel from 1½ quart without any extra care or cultivation, and without manure of any kind; soil a clay loam. I would advise all growers to try it next season. The pods grow uniformly handsome without a spot, and keep extremely well after they have been picked. All who prefer a wax bean will find this variety a gem. Wardwell's comes next. Golden Wax and Black Wax are good old varieties, but they are not prolific and it is quite expensive to raise them.

PEAS.—Having tested 80 varieties this last season, I consider the Telephone the best for bush. For dwarf early varieties Cable, Gem, Early Prize, Maud S., Early Hartford, Alexander's New Dwarf, and Rural New-Yorker are all good. For intermediate I prefer the Dwarf Champion, Stratagem and Burpee's Quantity. The latter variety is my wife's favorite. I consider all of those I have mentioned the cream of the field. I will also add Satisfaction (Sutton's)

POLE BEANS.—Dreer's Golden Cluster Wax pole, a new variety, I am well pleased with. I find it very prolific, and the quality cannot be surpassed. I am confident all who test this variety will be much pleased with it. The Jersey Extra Early is earlier than the Golden Cluster, but it is not so prolific or so profitable.

CUCUMBERS.—Rand's Improved White Spine is the finest that I know of. It is the best for the table and the most perfect in form and is very prolific. For pickling, I would grow the Green Mountain.

CABBAGE.—Gregory's All Seasons cabbage gives the best satisfaction. The Montreal Market is also a favorite in this section wherever it has been tested. The plants are sure to head. I would like the former better if the heads would harden up a little better. The latter is a new variety not yet known to many. It gives good satisfaction wherever tested.

BEETS.—Jewell and Eclipse are my favorites. They are early; the tops are small; the roots red, smooth and globe-shaped, and much larger than the Egyptian. They are superior to any I have tested.

LETTUCE.—Hanson's Improved gives me the best satisfaction. It is large, solid, sweet, crisp and tender.

POTATOES.—For this locality and almost all others, I consider the Charles Downing, Puritan, Garfield, Polaris and Albino the best for early varieties. For intermediate, Delaware, Green Mountain, Alexander's Prolific, Rural New-Yorker No. 2. and Ben. Harrison are my choice.

Chittenden Co., Vt.

FROM A. C. BATES.

After 30 years of cultivation and observation, I would recommend the following as the best vegetables for our locality. The main difficulty in the growing of vegetables as well as fruits is the desire to grow too many varieties. Next season I shall grow only those mentioned below, except that perhaps I may test a few of the advertised novelties in the way of fruits and vegetables.

RHUBARB.—Linnæus.

SQUASH.—Hubbard.

TOMATO.—Mikado, Early Hybrid, and Golden Queen.

PEAS.—Alaska, Laxton's Alpha, American Champion.

BEANS.—Bush: Valentine Improved, German Wax; pole: California Wax, Refugee.

SWEET CORN.—Farquhar's First Crop, Squantum, Stowell's Evergreen.

CABBAGE.—Wakefield, Henderson's Summer, Henderson's Succession, Fottler's Brunswick.

BEETS.—Egyptian Blood, Lentz.

CARROTS.—Hollow Horn.

CUCUMBERS.—Early Russian, Nichol's Medium Green.

EGG PLANT.—Early Pekin.

ONIONS.—Yellow Danvers, Red Wethersfield.

POTATOES.—Pearl of Savoy, Puritan, White Star.

TURNIP.—Purple Top Strap-Leaf.

FIELD CORN.—Leaming.

MANGOLD.—Golden Tankard.

What Others Say.

SHORT AND FRESH.

THERE are some catalogues, profusely illustrated with highly-colored pictures of vegetables and flowers accompanied by glowing descriptions of monster specimens which can easily be duplicated, so it is stated, by an investment in the seeds offered for sale. Such publications are apt to be the cause of much disappointment to those unversed in the culture of crops. Now, too, that seeds can more easily than ever, owing to the reduction of postage by one-half, be procured direct from the growers, there is no need for resort to the irresponsible grocery store.....

DON'T fail to get Henderson's Bush Lima, says W F. Massey in Orchard and Garden. He saw little bushes loaded with pods growing last summer, when the old climbing sort had not started to bloom. It is the vegetable novelty of the decade.....

SCARLET NONPAREIL, among eight different kinds of rhubarb, proved with Prof. Goff the earliest and most productive. He speaks a good word for the Dwarf Champion tomato. At the Rural Grounds it was among the best. Henderson's Early Snowball is his favorite cauliflower. For early celery he still adheres to the White Plume. The Early Dwarf Purple is decidedly the earliest and most productive variety of egg-plant he has grown.....

TRY the Viroflay spinach.....

"CORN ROOTS should never be disturbed by cultivation; but if they are to be wounded at all, let it be done when the plants are small," says Mr. Coleman..... .....

MATTHEW CRAWFORD says, on another page, that when the Hubbard squash was introduced he ate of it so freely that his skin was colored almost to an orange hue.....

MR. CRAWFORD pronounces the Volunteer the best tomato. The Spanish King onion yielded with him last season at the rate of over 1,200 bushels to the acre. The variety is not well fixed. He calls the Mrs. Foraker the most beautiful potato ever introduced.....

THE stump-rooted kinds of carrots are best because easiest to dig, handle and store.....

MR. GRUNDY says that the best bred and most wonderfully named corn on earth will rapidly deteriorate when grown on poor soil or only half cultivated.....

THERE are few better peas for second early than Advancer..... .....

GREGORY'S All-Seasons cabbage is a fine variety.....

DR. HOSKINS, of Vermont, finds the most profit in growing Pearl of Savoy for early, Polaris for second, and Pecan for long-keeping and spring sales. The last does not know how to sprout until placed in the ground. It needs a rich soil.....

MR. WYSOR, of Virginia says that the Italian onions are not worth growing. They begin to grow again almost as soon as matured.

Mr. WYSOR condemns the Brazilian flour corn.....

YELLOW DANVERS, Large Red Wethersfield and Southport White Globe are Mr. Falconer's choice of onions, because he wants red, white and yellow-skinned, and does not know three better kinds.....

MIDSUMMER, Quantity and Blue Beauty peas are praised by those who have tried them—the R. N.-Y. among the number.....

RUBY KING is the largest pepper..... ....

THE R. N.-Y. prefers Monarch rhubarb for size and tenderness though rather late....

VICTORIA rhubarb suits the venerable Jonathan Talcott rather better than any other kind.....

THE Purple-Top Strap-Leaf turnip is a quick grower, of good quality and is first-rate food for stock. See Mr. Smith's remarks.....

MR. SMITH commenced gardening in Green Bay, Wis., on less than one acre and without means. But he has increased his business until he now cultivates a splendid garden of 40 acres and all of it under a very high state of cultivation.....

H. M. ENGLE & SON say that Crosby's is the earliest good sweet corn that will produce sizable ears..... .....

Mr. J. M. Smith of Green Bay, Wis., left a portion of his Lima beans without poles, cutting back the vines once. When he gathered the crop, he found the finest and best beans on this portion of the plot.....

TRY Potter's Excelsior sweet corn.....

HALF-LONG STUMP is Mr. Smith's favorite variety of carrot. It is also the favorite of many others who have tried the different kinds side by side..... .....

HE considers the White Spine the best of all cucumbers.....

MRS. & GOV. FORAKER are among the new potatoes. These potatoes originated with John Nagle, Plymouth, Richland county, O. several years ago.....

THE Osage muskmelon, we learn, is largely grown about TerreHaute, Ind. It has been quoted in daily market reports of Chicago for two years past and has brought nearly twice as much as other melons. J. C. Vaughan of Chicago, Johnson & Stokes and W. A. Burpee & Co., of Philadelphia, Pa., catalogue it. Mr. Burpee thinks it is the same as Miller's Cream. He says it is a late variety .. ..

W. ATLEE BURPEE & Co. (Philadelphia, Pa.) control the stock of seed of two new onions, the Red and White Victoria. They are alike except in color. The onions are said to weigh from 2½ to 4½ pounds each, the quality "mild and sweet." They are further said to be good keeping varieties..... ....

BURPEE'S Golden Beauty corn seems to the R. N. Y. worthy of trial. It is a yellow dent

with very large kernels and a small cob. The tips and butts are well covered with grain, and the butts, instead of being larger than the ear above, are somewhat smaller, a very desirable characteristic. It is said that Mr. C. W. Holman, of West Willington, Conn., raised in 1885, 158 bushels of shelled corn on an acre .....

WM HENRY MAULE (Philadelphia, Pa.), claims for his Everbearing sweet corn that after the first ears are taken off when mature, one to two and four more ears will set and develop on the same stalks during the next two to four weeks, single stalks producing in this way "during the *entire* season frequently as many as six large, well-developed ears." The R. N.-Y. proposes to try this remarkable variety next season. We don't see where the "silks" (pistils) of the later sets get their pollen from. Or do the stalks produce a second "tassel" (male flowers)?.....

MR. GRAY, of Minneapolis, Minn. considers the onion next in importance to the potato. In preparing the soil he would use 75 tons of cow manure to the acre, and after planting top-dress with wood ashes and bone dust. He would plant sets instead of seed, and prefers White Portugal. As the bulbs begin to ripen he covers to a depth of two inches with earth to protect them from the direct rays of the sun. Thus he is reported in the Farmer's Review .....

THE TURNER HYBRID TOMATO.—"I see some subscribers object to this on account of its roughness. My experience with tomatoes is that we may raise rough or smooth tomatoes from the same variety. My plan is to remove the rough fruit as soon as the shape is seen; by this means those left will be much better." The above is from a writer in Popular Gardening. It may be well to repeat what the R. N.-Y. has previously said. The *shape* of a tomato may be determined before the flower falls. The ovary will show to a certainty whether the fruit will be smooth or many-lobed and ill-shapen.....

IT is now time to sow cabbage, cauliflower and tomato seeds in hot-beds. Potato seeds (from the ball) may also be sown now.....

JOHNSON & STOKES (Philadelphia, Pa.) give an illustration and a description of a mangel called the Chirk Castle. While in Scotland one of the firm saw "hundreds of specimens taken from the field, weighing *over 60 pounds each*, while whole crops averaged 38 to 40 pounds per root, producing a yield of over 60 *tons to the acre*".....

FORD'S New Mammoth podded Lima is claimed to be "absolutely the largest, finest-flavored and most productive of all Limas....

S. F. LEONARD (Chicago Ill.) announces the Golden Wonder millet, the heads of which are said to be 18 inches long, the hight of the plants about six feet. It is said to yield "enormously" both of grain and fodder.....

JOHN A. SALZER'S (La Crosse, Wis.) Earliest of All tomato is said to ripen in 80 days. Salzer's Iron-clad potato is represented as yielding prodigiously, as having remarkable keeping properties, few eyes, excellent flavor, etc. It is late.....

PRICE & REED (Albany, N. Y.) catalogue the following potatoes in their list: Queen of the Valley, American Giant, and Green Mountain. The R. N.-Y. has found them heavy yielders though of inferior quality. In the same list New Queen, Early Maine, Ohio Jr., and Stray Beauty, are worthy of trial.....

R. D. HAWLEY & Co., (Hartford, Conn.) claim that Hawley's Improved East Hartford is positively the earliest pea in cultivation....

MR. SAMUEL WILSON (Mechanicsville, Pa.) is the introducer of the much-advertised Northern Spy potato. Mr. Wilson has sent us a number of these potatoes some of which we shall plant. The others were cooked a few weeks since. The quality is good, the flesh white. It is claimed that this potato is a great yielder.....

THE R. N.-Y. has suceeded in raising very fair crops of peanuts. It is not beyond the possibilities that improved kinds may be made profitable in the North. We call attention to J. V. Faust's (Philadelphia, Pa.) "Improved Peanut." It is claimed to be very early and prolific, yielding fewer imperfect pods than any other.....

W. W. RAWSON & Co. (Boston, Mass.) offer Pringle's American Triumph and Pringle's Progress oats, also the Rural Branching sorghum which some seedsmen prefer to call Millo Maize—an absurd and unjustifiable name. The firm is headquarters for the Alpha potato, claimed to be the earliest variety in cultivation.....

REMEMBER, R.N.-Y. readers, that Teosinte (announced in every catalogue) will not mature seed north of Texas or Florida.....

QUEEN OF THE PRAIRIE is the same as Pride of the North corn, as stated by the R. N.-Y. some eight years ago. As we remember, they were sent to us the same year, the first by B. K. Bliss, the other by Hiram Sibley .....

J. J. H. GREGORY, (Marblehead, Mass.,) as we understand it, is the introducer of the much praised All-Seasons cabbage, so called because it is said to be just as good for late market, or to keep over winter, as it is for early market.....

HIS Hard-Heading cabbage is conspicuous for not cracking open and for remaining green longer than other kinds except the Savoys.....

THORBURN & Co. (New York) offer cow-peas, Canada field peas, tobacco seed of various kinds; also the Rural Thoroughbred Flint which we regard as the best variety of corn for ensilage. It is, however, too late to mature ears if grown in a much shorter season than that of New York.....

LANDRETH & SON (Philadelphia, Pa.) consider Landreths' Earliest cabbage 10 days earlier than any other. Landreths' First is claimed as the earliest long field cucumber in cultivation. This firm introduced the Garfield and State of Maine potatoes. The R. N.-Y. considers Landreths' Boss watermelon unsurpassed for family use.....

D. M. FERRY & Co. (Detroit, Mich.) consider Ferry's Early Puritan cauliflower the earliest, the surest header and the best for market or family use. Ferry's Optimus, in the R. N.-Y.'s estimation, is as good as any tomato in cultivation.....

THE Tomato egg-plant now advertised at a very high price for a few seeds, is the old Scarlet Chinese egg-plant of 30 years ago.....

PROF. A. J. COOK can hardly say enough in praise of the new Japan buckwheat. The millers say it is superior to any other kinds. It weighs 45 pounds to the bushel. For griddle-cakes it is A. No. 1.....

JAMES VICK (Rochester, N. Y.) places the Ohio Junior at the head of his list of early potatoes. See R. N.-Y., report, page 161, 1888.

Mr. VICK, after sufficient trial mentions the Irondequoit muskmelon as "a fruit of great merit." He deems the Ideal cauliflower the earliest and, all things considered, the best variety in cultivation.....

Too much can scarcely be said of the cabbage "All Seasons." .....

PETER HENDERSON (New York) says the Cylinder Wax bean is earlier than any other stock. Autumn King is claimed as the finest strain of late cabbage ever offered.....

MR. HENDERSON claims that his New Bush Lima is at least two weeks earlier than any climbing Limas .....

PETER B. MEAD says of the Bush Lima that it grows exactly like the ordinary bush bean and that it will find a place in thousands of gardens where the old climbing bean is unknown, as few will go to the expense and trouble of providing and sticking poles. The beans are the size of the Sieva or small Lima. The bushes grow 18 inches high and produce a continuous crop in this climate (N. Y.) from July 15 until frost.....

YOSEMITE MAMMOTH WAX bears beans, as stated, eight inches long or even longer. The pods are all nearly solid pulp and absolutely stringless .....

GOLDEN CUSTARD squash, Jonathan pumpkin, Puritan potato, Japan buckwheat.....

ACCORDING to the Wisconsin Station, of 13 varieties of dent corn most of which were advertised to mature in Southern Wisconsin, only three were found sufficiently early to depend upon for general crop, viz: Pride of the North, North Star Golden Dent and Queen of the North. The first two varieties have been indorsed by the Station for several years. The Queen of the North is a larger form of the Pride of the North, and consequently a few days later than the last-named variety, but in an ordinary season it can be relied upon to mature in Southern Wisconsin.....

FOR that portion of the State that can not mature the dent varieties, the Station has found nothing superior to the King Phillip, unless it be Sibley's White Flint, a variety that attracted much favorable comment from visiting farmers who saw it growing on their grounds the past season.....

FOR the very earliest use, the Station mentions three varieties with preference in the order given: Cory, Early La Crosse, Early Narragansett.

For second early: Early Minnesota and Perry's Hybrid are recommended.

Stowell's Evergreen and Henderson's Sugar Corn are very superior for extremely late varieties.....

THE thickness of the hull of oats should be taken into consideration. A study of 26 varieties grown by the Wisconsin Station the past season, resulted in finding a difference of 10 per cent. in the weight of hulls of different varieties; this fact though rarely thought of when selecting a new variety, is worthy of consideration.....

ANOTHER year's experience warrants the Station in continuing the White Schœnen, so often commended by the R. N.-Y., at the head of the list. The reason for urging this variety is, that the seed may be obtained in any quantity at reasonable prices, of Wisconsin farmers themselves.....

SWEDISH OATS have been grown by the Station three years and proved constant in their yield; they stand up well and have thin hulls. The Welcome is prolific and hardy, but it has a thick hull. Salzer's White Bonanza the Station pronounces very promising....

EARLY DAKOTA WHITE was one of the earliest to ripen and it stood up beautifully. It has a thin hull. The American Banner bought of J. C. Vaughan of Chicago, Ill., yielded at the rate of 72 bushels per acre, weighing 32 pounds to the bushel. Hull thick.....

OF 10 kinds of barley, the Wisconsin Station found that the Manshury won an easy victory. It is the best variety for a general crop .....

ATTENTION is called to a new medium-ripening potato, the Summit, which originated with E. E. Stine, Cuyahoga Falls, O. "It bids fair," the Station says, "to do him much credit." See R. N.-Y., report, page 281, 1886.

THORBURN and Early Sunrise potatoes are praised as productive and of good quality for early kinds.....

ABSTRACTS.

——POPULAR GARDENING: "I have at hand a catalogue from a responsible firm, showing a geranium with 34 clusters of bloom in sight and a small plant at that. I find almost everything in this way. How can the buyer get any knowledge of a variety by these cuts? We certainly want new sorts: we want varieties that are free bloomers, but when the dealer gives us to understand that 50 clusters of bloom on a small geranium are possible, we get disgusted, and I for one cannot trust other statements, some perhaps that are true."

——O. C. FARMER: "A good garden is an obligation which no wise farmer will deny his family. On the score of profit, it stands at the head, while its effects on the family health are invaluable. Less pork and animal food generally will give us better men and women, mentally, morally and physically."

——"The horticulturist who can read the glowing catalogues of our seedsmen and gaze on their attractive pictures without getting a little "enthused," is made of unmalleable clay, or else has had his enthusiam chilled by experiments in former years. We could wish our seedsmen would be a little more temperate in praise of their novelties; but, after all, it is the 19th-century way of doing business, and the seedsmen are not worse than men in other lines of trade. They certainly tend to excite interest in the garden, even if disappointment follows the experiment."

Horsford's Acid Phosphate

A Healthful Tonic.

Used in place of lemons or lime juice it will harmonize with such stimulants a are necessary to take.—*Adv.*

Miscellaneous Advertising.

Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2¼-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

$20 FENCE MACHINE FOR $10

Freight paid. Warranted. Hundreds in use. Circulars free. S. H. Garrett, Mansfield, O.

Trees, Seeds and Plants.

If you want the best Garden you have ever had, you must sow

MAULE'S SEEDS.

There is no question but that Maule's Garden Seeds are unsurpassed. Their present popularity in every county in the United States proves it, for I now have customers at more than 31,000 post-offices. **When once sown, others are not wanted at any price.** Over one-quarter of a million copies of my new Catalogue for 1889 have been mailed already. *It is pronounced the most original, beautifully illustrated and readable Seed Catalogue ever published.* It contains among other things, cash prizes for premium vegetables, etc., to the amount of $3,500. **You should not think of purchasing any Seeds this Spring before sending for it.** It is mailed free to all enclosing stamp for return postage. Address

WM. HENRY MAULE,
1711 Filbert St. **PHILADELPHIA, PA.**

TREES ROSES GRAPES

We offer the largest and most complete general stock in the U. S., of **Fruit & Ornamental Trees, Shrubs, Evergreens, Roses, Pæonies, Hardy Plants, Grape Vines, Small Fruits,** etc., including many **Novelties.** Catalogues giving information indispensable to planters, sent to all regular customers **Free**; to others: No. 1, Fruits, 10c.; No. 2, Ornamental Trees, &c., illustrated, 15c.; No. 3, Strawberries, No. 4, Wholesale, No. 5, Roses, *Free.*

ELLWANGER & BARRY,
MOUNT HOPE NURSERIES, | ROCHESTER, New York.

SEEDS.

My Annual PRICED CATALOGUE is now ready and mailed free to all applicants. It contains all the leading and most popular sorts of

Vegetable, Farm, —AND— Flower Seeds,

Besides all the desirable novelties of last season, and nearly everything else in my line of business.

ALFRED BRIDGEMAN,
37 East 19th Street, New York City.

OVER **6,000,000** people believe that it pays best to buy Seeds of the largest and most reliable house, and they use

Ferry's Seeds

Earliest Cauliflower in existence.

D. M. FERRY & CO. are acknowledged to be the *Largest Seedsmen* in the world. D. M. FERRY & Co's Illustrated, Descriptive and Priced **SEED ANNUAL For 1889** Will be mailed FREE to all applicants, and to last year's customers without ordering it. *Invaluable to all.* Every person using Garden, Field or Flower Seeds should send for it. Address

D. M. FERRY & CO., Detroit, Mich.

Beautiful Strawberries. We are now offering for the first time and only by us, the beautiful **Eureka**, and a strawberry that yielded at the rate of **127 Bushels** to the acre at one picking the past summer—60 other varieties; **80 of Grapes; Thompson's Early Prolific** Red Raspberry, the earliest of all; Palmer Rash the most productive early Black; **Thompson's Early Mammoth Blackberry**, etc., etc. If you mention this paper we will send you Catalogue free, telling about these beautiful berries & others Everybody wants it

CLEVELAND NURSERY,
Lakewood, Cuyahoga Co., Ohio

JESSIE only $2 per 1,000. Crescent, $1; all varieties; prices *free.* SLAYMAKER & SON, Dover, Del.

600 ACRES. 13 GREENHOUSES.

TREES AND PLANTS

We offer for the Spring trade a large and fine stock of every description of **FRUIT and Ornamental TREES, Shrubs, Roses, Vines, SMALL FRUITS, Hedge Plants, Fruit Tree Seedlings** and **Forest Tree Seedlings.** Priced Catalogue, Spring of 1889, mailed free. *Established* 1852.

BLOOMINGTON PHŒNIX NURSERY

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, MARCH 2, 1889.

CHANGE OF CLUBBING TERMS.

The N. Y. Weekly World and the R. N.-Y., $2.25.

The Detroit Free Press and the R. N.-Y., $2.25.

The Courier-Journal and the R. N.-Y., $2.25.

The Weekly Inter-Ocean and the R. N.-Y., one year, $2.50.

The lowest possible clubbing rates with any journal in America will be given on application. Subscribe through the RURAL NEW-YORKER.

Good, responsible agents wanted. We are prepared to offer very liberal terms. Correspondence solicited.

THOSE of our friends who have not tried the Crosby sweet corn should do so. The R. N.-Y. has tried it for two years and finds it, though an early variety, one of the very best in every way.

"Were it not for the necessity of earning a living, my inclinations would lead me to spend my entire time in testiny new things, raising seedlings and seeing what perfection could be reached regardless of cost."

MR. CRAWFORD, page 139.

FOR home use, or even for market, the R. N.-Y. prefers the Advancer or Alpha for early wrinkled peas to the American Wonder so popular with many. There is no material difference in the time of ripening, and all are of excellent quality, while the first two will yield three times as many peas as the Wonder.

THE next R. N.-Y. Special will be published week after next. It will consider the questions: 1. What varieties of small fruits may be considered improvements over the older varieties, and (2) what are the best of the older sorts—all by experienced growers.

IN the R. N.-Y.s experience, the Early Ohio is the earliest potato. It is of very good form and quality. The vines are rather dwarf and the seed-pieces may be planted closer together than those of other early kinds. We have always hesitated to commend this variety, however, for the reason that while it produces abundantly in some places, it fails in others. It needs a light soil.

Mr. J. M. Smith, during his 30 years' experience, concludes that growing either vegetables or fruits, in such a manner as to make a success of it, is no business for a lazy man. It is no better for an ignorant man, than for a lazy man. Success on poor land is impossible. The difference in price between a first-rate article nicely prepared for market, and a fairly good article only half-prepared, gives success on the one hand and failure on the other.

THE R. N.-Y., in this issue, calls the attention of its readers to the best new and standardvarieties of vegetables, etc., as estimated by a number of experienced growers and as they have been judged at the Rural Experiment Grounds. This we have done regardless of advertising patronage—those who do not advertise in this journal being mentioned as originators, introducers, etc., the same as those who do. It is to be hoped that our readers will be aided by this special number in making selections that will better their crops.

IN some of the English seed and plant catalogues we see in mighty type and in the most conspicuous parts: "Seedsmen to His Most Gracious Majesty the King of Italy; seedsmen to His Most Gracious Majesty the King of Portugal; seedsmen to His Imperial Majesty the Sultan of Turkey; seedsmen by Royal Warrant to Her Majesty the Queen; seedsmen by Royal Warrant to His Royal Highness the Prince of Wales, having been honored with His Royal Highness's Commands for nearly 20 years." "What fools we mortals be."

FROM MR. JOHN H. EVANS, one of the owners of the promising "Idaho" Pear, we learn that two specimens were sent to France, September 20, from Lewiston, I. T., to prominent nurserymen. They were received October 16. The specimens weighed 16 ounces. The quality was pronounced "exquisite." Such testimonials, after the pears had traveled 7,000 miles, speak pretty well for it. We are led to doubt whether the R. N.-Y. will ever have occasion to regret having been the first to bring this remarkable variety to prominent notice.

CATALOGUE notices appear this week on page 147. It will be well for our readers, by an examination of the leading catalogues published, in connection with the articles presented this week, to learn what may be a consensus of opinion regarding the varieties praised or condemned. All novelties are more or less extravagantly praised, else they would command little or no attention. While a large per cent. are not superior to better-known and lower-priced kinds, it must not be lost sight of that all improvements are made through the trial of novelties. The very best of the seeds or plants of any kind grown to-day were novelties once. It is very plain, therefore, that those who denounce them unqualifiedly are likely, sooner or later, to fall behind their more progressive neighbors. The alert gardener or farmer must know what is the best early or late potato, sweet corn, field corn, tomato, cabbage, bean, celery, beet or onion; and this can be ascertained only by trial. It is the R. N.-Y.'s opinion that all intelligent, earnest farmers or gardeners can afford—taking one year with another—to try, in a small way, all of the novelties annually announced that seem, by the claims made for them, however manifestly overdrawn, to offer one chance in 20 of being superior to standard varieties.

TO THE WOMEN WHO PROPOSE TO ENGAGE IN THE R. N.-Y. POTATO CONTEST.

A CORRESPONDENT alluding to the Women's Potato Contest, suggests that it is manifestly unfair to award the premiums to those who raise the largest crop *at the least cost.* "What chance," she asks, "has a woman on some of New England's barren fields in competition with her sisters in situations where the soil has all its virgin fertility?"

The position is well taken undoubtedly. The R. N.-Y. is in favor of cutting out that saving clause and allowing all contestants to use all the manure or fertilizer, or both, deemed desirable. The R. N.-Y. may safely assure its lady friends that the utmost fairness shall prevail in making the awards. Meanwhile any further suggestions will be welcomed.

THE DRESSED MEAT TRADE AND THE LIVE STOCK INTERESTS.

AT the present time there is no other subject more seriously agitating the great cattle interests of the country and especially those of the West than the action of the dressed meat "combine" and its depressing influence on the prices of live stock. At the invitation of Governor Darling, of Missouri, the Governors of Pennsylvania, Ohio, Indiana, Kansas, Colorado and Nebraska have already agreed to appoint representative delegates to a convention to be held next month in St. Louis to devise the most effective legislation on this matter, and it is very likely the Governors of several other States will soon follow their example. Already measures against the dressed meat trade have been introduced into the legislatures of several of the States, and it is intended to introduce similar bills into all the others before long. Hitherto the success of such measures has not been great. The Ohio Senate has decidedly defeated the bill requiring the official inspection, at the place of slaughter, of all animals furnishing food for human consumption within the State, and the Judiciary Committee of the Pennsylvania Senate has reported adversely on a similar bill. In the Missouri, Kansas and Colorado legislatures, however, bills of the same nature now pending are likely to meet with a more favorable reception.

The other day a dozen or more cattlemen representing most of the largest cattle interests of the West, met at Kansas City to form a "combine" for the purposes of handling their stock themselves, thus relieving them from the incubus of the "Big Four," and doing away with the expensive commission system now in vogue. They proposed to form an organization with headquarters at Omaha, Kansas City, St. Louis, Chicago and New York, with branches at Wichita, Kansas, and Fort Worth, Texas, where stock will be received and sold on the commission plan. Last Thursday representatives of the stock-raising industry from every State and Territory west of the Mississippi and from Illinois and Kentucky, met at Kansas City and completed the organization. The members of the Association have now 163,000 head of cattle ready to send to market. The new company will not confine its business to its members, but will do a general commission business in live stock on a large scale.

HARD WORK—POOR PAY.

IT was about ten years ago, as the R. N.-Y. remembers, that the Emerald Gem Market Garden pea was first announced by Carter & Co., the London seedsmen. It was tried at the Rural Grounds, and, every season since, a few (not over half-a-dozen) of the *largest, earliest* and *best-filled* pods have been selected for seed for the next season. This has resulted in increasing the *size* of the pods and the *number* and *size* of the seeds in the pods perceptibly; but the strain does not seem to be any *earlier* now than the original variety. The seeds raised last summer were presented to a firm of this city and the strain will be introduced in due time. The vines, which, in rich soil, grow two feet high, are peculiar in having no "bloom" upon either stems or leaves, so that the color is of a delicate "emerald" green, which doubtless suggested the name.

The object of this note is to show that in many cases those who originate or improve plants are very inadequately paid for their labors. Had the writer of this note been paid one dollar a seed for the dozen pods given to the seedsman, it would not have compensated him for the time spent in his endeavors to improve the original Emerald Gem. We raised potatoes from seeds for 10 years before a variety was produced that promised to be superior to those in the market. We crossed wheats six or seven consecutive seasons without producing any varieties of unusual worth. Some 14 years ago we commenced to cross gladioli. The work was continued for four years with some success. By an accident every bulb (corm) of the new cross-breeds was destroyed. We spent the better part of three entire winters in crossing geraniums (pelargoniums, properly) with the reward that not one of the kinds so produced is known to-day. The third year there were no less than 1,500 cross-bred seedlings in this collection. There were odd and beautiful plants among them, but we were not willing to be satisfied with anything less than something *wonderful*, failing in which, the whole lot was destroyed. We grieve over that destruction even now; for, in the light of a more enlightened judgment, there were many seedlings among them which might well have been propagated and introduced.

We have now some 70 hybrids with the Ramanas rose, Rosa rugosa—the *first* hybrids of this kind known in so far as any printed record shows. The hybrid Rugosa, Madame G. Bruant, was not announced until nearly two years after the first announcement of the R. N.-Y's hybrids, though among the novelties in the new catalogues it is called "the *first* of a new race of hybrids originated by crossing the single Rugosa with the tea-rose Sombreuil." It is true we have never used this tea-rose in crossing, and therefore Bruant is really the first of that particular male parentage. But it is *not the first hybrid Rugosa.* Besides the RURAL'S 70 Rugosa hybrids, we have 150 or more seeds, the result of further crosses with Rugosa, made the past summer. What will be the outcome of this work remains, to be seen. Next summer it is hoped, will throw some little light on the question. We have also about 20 plants which are hybrids between the blackberry and raspberry, besides another lot of hybridized seeds produced last (the third) season. The three or four of the first lot which fruited give no evidence that these hybrids will mark an advanced step in horticultural progress. Even a brief account of our incessant, though, for the most part, useless, endeavors during the past 15 years to hybridize other fruits and ornamental plants would weary the reader. We may say, however, that the work has been carried on patiently, perseveringly and at a considerable cost in time and money. As *one* result of all this, the R. N.-Y. can at least sympathize with other conscientious workers in the same field, who, when they come to *dispose* of the new varieties of seeds or plants over which they have toiled for years, receive a mere pittance for their "novelties" and the assurance that the public are sick of them, and regard the "exorbitant" prices asked as a flagrant imposition!

And a good share of the farm and garden writers—those, of course, who have never engaged in the lottery-work of originating or improving our economical plants—join in the howling chorus. So it happens, friends, that this inexhaustible field, this land of promise that yields more and more the more it is worked, and to which the world must in a great measure look for pomological, horticultural and agricultural improvements, attracts only the few—the big-hearted few who lose sight of themselves and their worldly goods in their efforts to benefit mankind.

BREVITIES.

DWARF GREEN is the best Okra.

NEW YORK Improved Egg-plant is the best.

NICHOL'S cucumber for pickles; Tailby's for sliced cucumbers.

ALL else being equal, a medium-sized ear of sweet corn should be preferred.

THE R. N.-Y. still prefers the Stratagem for an intermediate pea—vines 2½ feet high.

"THE Savoys are immensely superior to plain cabbages," says W. Falconer on page 139.

A. B. COLEMAN gives a simple and what he deems the best remedy against the cabbage worm.

MR. FALCONER calls the English Gray Mushroom the best vegetable on the face of the earth. Is he right?

FARMER'S CLUB SPECIAL next week. This special number will exceed in interest and value any farmers' institute that ever was held. See if it does not.

IF your asparagus bed needs food and you have faith in salt, use kainit and raw-bone flour. The kainit will supply both salt and potash; the bone flour, phosphoric acid and nitrogen—a "complete" fertilizer with lots of salt in the bargain.

ALL else being favorable, we would select our list of seeds from the catalogue giving the most conservative illustrations and descriptions. Exaggerated, impossible claims for the seeds and plants offered should give rise to suspicions rather than captivate the intelligent, truth-loving would-be purchaser.

ALLUDING to the gross exaggerations of the illustrations in the catalogues of several seedsmen, the American Florist says that, in justice to the honest catalogue men, some means should be taken to remedy the present state of affairs. It is unjust to them that swindlers should be permitted to bring obloquy upon the whole profession and lower it in the eyes of the public.

THE noted market gardener J. M. Smith, of Green Bay, Wisconsin, finds no difference between good strains of the old Daniel O'Rourke and the current varieties of "First Early" peas known by as many names as there are seedsmen. The R. N.-Y. is of the opinion, however, that the O'Rourke has been notably improved by the careful selections of those seedsmen who attach their names to the "First Earlies," and that it is manifestly to their interest to continue these careful selections from year to year.

THE improved breeds of cattle have stamped their distinctive features upon the common cattle of the country to such an extent that any farmer can distinguish the various markings, and tell whether a cow is a Jersey, a Devon or a Holstein grade. How is it with horses? Except in the West, where increased interest in draft horses has made a study of horse breeding necessary, few farmers can tell what breeds their horses have come from. Would they be better off if they could tell?

THE bonded railroad debt of Muhlenberg county, Indiana, has been allowed to grow until it now amounts to $1,000,000. The sheriff of the county has been removed from office because he refused to collect a tax to pay the interest on the county bonds, and no one can be found willing to discharge the unpleasant duty. All attempts to compromise have failed, and the creditors are likely to ask the Federal courts to foreclose their mortgages on the real estate of the tax-payers. This will impoverish the great majority of them, and there is likely to be trouble. It is now becoming more and more forcibly realized that railroad bond voting has been carried too far in the West.

CATALOGUES, ETC., RECEIVED.

INDIANA INVESTIGATION.—A number of bulletins have been received from the Indiana Experiment Station. Among them are the following:

Experiments With Vegetables, by Prof. Troop. A number of experiments with commercial fertilizers on potatoes and with various varieties of potatoes, are here recorded. In planting the potatoes Prof. T. used the same system that the RURAL has always used in its experiments. The results are conflicting, to say the least. Experiments with sweet corn, peas, beets and onions are also recorded.

Spotting of Peaches and Cucumbers, by Prof. J. C. Arthur. This is an important and well gotten up bulletin, showing the result of considerable research. Unfortunately no remedies have yet been discovered for either of the fungi causing these diseases.

Experiments in Cross-Fertilization and with Tropical Ferns, by Prof. Van Landeghen. All experimenters will be pleased with this bulletin. The pictures are all well calculated to add to the value of the text.

Parturient Apoplexy, by Dr. Hinebaugh. We are receiving a number of questions regarding treatment of cows for milk fever. The following from Dr. H.'s bulletin will be valuable just now.

"This disease is easily prevented, but somewhat difficult to cure. For two weeks previous to calving diminish the food. Keep the bowels active by small doses of Epsom salts or a laxative diet. Avoid all highly nutritious food. The common practice with some people of giving extra food at this period to increase the flow of milk is, without doubt, the most prolific cause of this disease."

ROBERT SCOTT & SON, PHILADELPHIA, PA.—This attractive catalogue is mostly given up to popular plants. The list of roses comprises the best of the new and the best of the old varieties. A new double geranium, "Centaure," is represented as the "largest and finest in cultivation." A colored plate shows Primula obconica, the new rose Madame Etienne, Salpiglossis grandiflora, sweet pea Princess Louise, and the pelargonium above alluded to, Centaure. The catalogue gives prominence to Crozy's new cannas, which on account of their dwarf habit, large flowers and long season of bloom, must rank as our most satisfactory bedding plants.

The following "introduction box" of roses is offered for one dollar. The Bride, Sunset, La France, Marie Guillot, Etoile de Lyon, Queen's Scarlet, Coquette de Lyon, Comtesse Riza du Parc, Hermosa, Catherine Mermet, Madame Camille, and Mad. Caroline Custer.

MICHIGAN FORESTRY.—Report of the Directors of the State Forestry Commission, sent by Dr. W. J. Beal, Lansing, Michigan. This is an important publication. In 1887 the legislature of Michigan passed an act giving the State Board of Agriculture power to act as an independent forestry commission. It was proposed that this commission should take steps to ascertain how much loss is being sustained by the forests of Michigan from fires and wasteful cutting, and also as to the effect of this diminution of the wooded surface upon ponds, rivers and water-powers. Dr. Beal and Chas. W. Garfield were appointed directors to begin this investigation, and this volume is a record of their labors up to the date of publication. The book contains notes on a great variety of topics, a report of a convention held at Grand Rapids and a "symposium" arranged by Dr. Beal. The illustrations give very accurate pictures of life in the lumber regions. The first picture, representing what is left of a great pine forest after the lumbermen have taken all they want, is almost sad in its truthfulness.

NEW MODEL BUCKEYE MOWER.—Catalogue from the Richardson Manufacturing Company, Worcester, Mass. This is what the manufacturers say about the machine they are making: "New England farmers are a thrifty, saving class, and they demand implements that will endure. In other localities, where farmers are more lavish, and little care is taken of farm machinery, a cheap mower, to last a single season, is accepted. If a good machine is bought it is ruined by one season's neglect. The Buckeye is built for critical New England farmers, who demand that a machine properly cared for, shall last a lifetime. We do not compete with the builders whose machines can have but a short life, but we offer the Buckeye, confident of its durability at every point." The catalogue is an elegant affair with excellent illustrations, showing the mower in every position.

S. F. LEONARD, 149 WEST RANDOLPH ST., CHICAGO.—This large and voluminously illustrated catalogue gives well-selected lists of spring wheats, oats, potatoes, field corn, sorghums, millets, grasses, clovers, etc. Sixteen pages are devoted to novelties. The $250 prize collection of seeds is sent (one packet of each) for $1.00. Osage melon, Chicago Market Sweet corn, Upright Champion tomato, Leonard's Bridgeport Drumhead cabbage, Leonard's Globe Danvers onion, Edmand's Blood beet, Westerfield Chicago pickle are illustrated in colors, and $25 each for the best yields are offered. The catalogue will be sent without charge to all R. N.-Y. readers who apply to Mr. Leonard.

HENRY A. DREER, 714 CHESTNUT ST., PHILADELPHIA, PA.—This is a large (150 pages) handsome and costly catalogue of seeds of all kinds as well as hardy and greenhouse plants, fruits, etc. It is finely illustrated throughout. A colored plate and engraving show Dreer's Eclipse asparagus, a bunch of which is shown to be made up of stalks two inches in diameter and 15 inches high. It is said to be the largest asparagus ever sent out. The seed is 15 cents per packet; two-year roots $2.00 per 100. The R. N.-Y. is trying every kind of asparagus side by side in its test grounds. Dreer's Golden Cluster Wax pole bean is placed before the reader as the *best* pole bean. Among hardy plants attention is called to Aristolochia ornithocephala and A. cymbifera, the Bird and Boat-flowered Aristolochia, also to A. elegans. This is one of the most interesting catalogues we have examined.

JOHN SAUL, WASHINGTON, D. C.—This is a catalogue (80 pages) of new, rare and beautiful plants—musas, clerodendrons, aphelandras, alocasias, passifloras, anthuriums, yuccas, dracænas, begonias, montbretias, dieffenbachias, nepenthes, hoyas, ornamental asparagus, crotons, ferns, new cannas, palms, abutilons, marantas, primroses, hardy trees and shurbs, clematis gloxinias, geraniums of all kinds, fuchsias, dahlias and innumerable other choice plants. We are indebted to Mr. Saul for the introduction of many valuable novelties. Also a catalogue of roses of all sorts.

THE STORRS & HARRISON CO., PAINESVILLE, O.—This is one of the best and largest nursery firms in America, and its name is everywhere respected. The present catalogue (140 pages) is one of unusual interest and merit: 23 pages are given to seed and plant novelties and specialties. The firm puts up certain collections at greatly reduced prices which may be forwarded by mail. Thus, 15 roses all different, will be mailed for $1.00; an assortment of 14 different bedding plants for $1.00; one dozen different kinds of fruit trees (apples, peaches, plums, cherries, apricots, grapes, strawberries, blackberries, etc.,) for $2.00. Not only does the firm offer the usual lists of vegetable, flower or farm seeds, but also all kinds of fruit, evergreen and deciduous trees. The catalogue should be examined by all R. N.-Y. readers.

J. T. LOVETT, LITTLE SILVER, N. J.—A handsome catalogue of 80 pages with several colored plates and many wood-cuts. One colored plate shows the Abundance and Spaulding plums, Gandy and Monmouth strawberries, Early King and Erie blackberries. Collections of fruits are put up at reduced prices. Thirty pages are given to small fruits, 17 pages to large fruits, two pages to nuts and the rest to ornamental trees, shrubs, roses and the like. The Wonderful peach is praised as a large, handsome and productive, *very late* peach, as large as the Crawford, as late as the Smock, and a reliable bearer. A large engraving shows the Lawson or Comet pear, the largest and handsomest of early pears, though the quality is not of the best.

JOHN LEWIS CHILDS, FLORAL PARK, QUEENS CO., LONG ISLAND, N. Y.—This showy catalogue delights us with three colored plates, one of very large and beautiful, hardy carnations, Childs' New Jubilee Phloxes—a very pretty picture, indeed—and a colored cover of roses, etc. Mr. Childs offers the Crandall currant, the Japan chestnut, filberts, pecans, and a selection of the best small fruits. There are a number of interesting plants, such as Brugmansia arborea ("Giant Ghost Flower"), the Yellow calla, new varieties of hardy hibiscus, etc.

JOHN A. SALZER, LA CROSSE, WIS.—A large, extremely showy catalogue of seeds and plants. Much space is devoted to cereals, fodder plants, etc. White Wonder and White Bonanza are among the new kinds of oats. Assiniboia Fife, Okanagan Valley Velvet Chaff, French Imperial Spring Saskatchewan Fife are among the wheats offered. They are all spring varieties. The large sum of $3,260 is offered as prizes for the best yields, so distributed that there seems a fair chance for all competitors.

LUCIEN SANDERSON, 87 LONG WHARF, NEW HAVEN, CONN.—This firm sells *fertilizing materials* in any quantities. The farmer mixes them, and in this way saves paying others for the labor which he performs himself. Mr. Sanderson puts up four formulas, one or the other of which will meet the purchaser's wants. We would advise our friends to read this pamphlet. It tells *how* to mix economically and gives some valuable hints.

HORSES, CATTLE, SHEEP AND SWINE.—This is the title of an attractive volume just issued by Prof. Geo. W. Curtis, of the Texas Agricultural College. It gives a concise and readable history of the various breeds of live stock, with excellent hints as to breeding, feeding, and training. It is an excellent book containing many origina features. Price $2.50; For sale by the author, at College Station, Brazos Co., Texas.

MILK AND VINEGAR IN MASSACHUSETTS.—Thirtieth Annual Report of the Inspector of Milk and Vinegar, sent by James F. Babcock, Boston, Mass. This is an interesting volume, as several timely topics are discussed in it. The present position of the oleomargarine question, the wisdom and morality of coloring butter and the methods employed in purifying and preserving butter are questions that are ably discussed.

TAXATION.—This is the general topic discussed in the Consular Reports, Numbers 99 and 100 (November and December), just issued by the State Department. Fifty-two of our representatives in foreign countries give the modes of taxation employed in the countries in which they live. It is a very important and interesting volume.

ELLWANGER & BARRY, ROCHESTER, N. Y.—A descriptive catalogue of select roses and one of the most conservative and trustworthy of all similar catalogues published. Practical, brief instructions are given as to planting, pruning, insects, etc. A list of new and recently introduced roses is appended. Among them is the rose Mad. G. Bruant, a hybrid between R. rugosa and the Tea rose, Sombreuil.

F. C. HUNTINGTON & CO., INDIANAPOLIS, INDIANA.—A catalogue of farm, garden and flower seeds. Huntington's Improved Earliest Red Valentine Bush-bean is represented as 10 days earlier than the Early Red Valentine. Wardwell's New Kidney Wax, King of the Garden Lima, the Lentz beet, improved strains of cabbage, onions, lettuce, musk and watermelons, peas, radishes, are among the specialties.

C. I. HOOD & CO., LOWELL, MASS.—Calendar for 1889. There is a peculiar charm about the beautiful baby face which looks at us with such life-like love and innocence, from these calendars. One never tires of such faces. They are as fresh and attractive in December as they are in May. Send for, or call at a drug-store and get one.

NEW JERSEY HORTICULTURE.—Proceedings of the Fourteenth Annual Meeting, sent by Secretary E. Williams. A very good report of this meeting was given in the first issue of the RURAL for this year. The New Jersey horticulturists are generally considered about the best authorities on horticultural matters that we have.

VILMORIN-ANDRIEUX & CO., No. 4 QUAI DE LA MÉGISSERIE, PARIS.—An illustrated catalogue (182 pages) of all sorts of vegetable, flower and farm seeds. A long list of wheats. Probably one of the most conservative and reliable catalogues published.

ALABAMA AGRICULTURE.—Report of the Commissioner of Agriculture for the year ending September 1888. This report is not as interesting as it might be. The agricultural resources, climate and needs of Alabama would warrant a much more attractively displayed statement.

ALFRED BRIDGEMAN, No. 37 EAST NINETEENTH ST., N. Y.—A plain, clear, condensed, trustworthy catalogue of an excellent house. The best of all vegetable and flower seeds are listed without hifalutin comment.

JOEL HORNER & SON, DELAIR, CAMDEN CO., N. J.—A catalogue of grape-vines and small fruits. Eaton, Moore's Diamond, Moyer, Nectar and Downing are mentioned among the newer grapes.

G. H. & J. H. HALE, SOUTH GLASTONBURY, CONN.—A catalogue of choice small fruits. Five pages are given to an interesting essay on "Money in Small Fruits" by Mr. J. H. Hale. Only the leading kinds are catalogued.

IOWA SEED CO., DES MOINES, IOWA.—An illustrated catalogue of seeds, etc., 70 pages. A new potato called the Eyeless and a second, Wide-awake, seem to give promise of merit.

CHAMPION VEGETABLE CUTTER.—Circular from John R. Whittemore, Chicopee Falls, Mass. This is an excellent implement. The circular also contains illustrations and descriptions of the Victor feed-cutter and the Improved Champion harrow—three good implements.

PENNSLYVANIA AGRICULTURE.—Report of the Pennsylvania State Board of Agriculture for 1888, sent by Secretary Thomas J. Edge, Harrisburg, Pa. This is one of the best volumes of the kind we have ever examined.

R. & J. FARQUHAR & CO., BOSTON, MASS.—An excellent catalogue of 125 pages and 16 pages of specialties. Seeds of all kinds, ornamental grasses, bulbs, plants, shrubs and trees.

Miscellaneous Advertising.

The Kodak.

PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be re-loaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker.

Indust'l Societies.

WESTERN NEW YORK HORTICULTURAL SOCIETY.

(RURAL SPECIAL REPORT.)

The society decides to retain its old name; "the slovenly fruit-grower must go;" comments on small fruits; a large peach orchard; avoidable causes of unremunerative markets; faulty packages for Europe; a good apple picker; spraying all fruit trees insisted on; plum culture for market; grapes; cold-storage; insecticides and how to use them; the canning industry; indorsement of nitrates and of J. S. Woodward.

A well attended meeting of this society was held at Rochester on January 23 and 24, 1889. The election of officers resulted mostly in a re-election: Patrick Barry, president; S. D. Willard, W. C. Barry, W. Brown Smith, J. S. Woodward, vice-presidents; P. C. Reynolds, secretary and treasurer. The President's annual address, read by chairman W. C. Barry, spoke of the failure of the efforts made to obtain State aid for the society, and recommended the reconsideration of the resolution by which the society was to organize as the New York State Horticultural Society. The question was considered towards the close of the meeting, and as a result the Western New York Horticultural Society still lives. The address mentions the slovenly fruit-grower as the one who raises the cry of overproduction, and "the slovenly fruit-grower must go."

In a report on Garden Vegetables, Mr. E. S. Goff has a good word to say for the Danish Bald-head winter cabbage, the Gilt-edge, Snowball, and Snowstorm cauliflowers, the California Cream Butter lettuce, the Baltimore Nutmeg, Emerald Gem, and New Orange Cream melons, Childs' Celestial pepper, White Chestnut and Sibley squashes, Dwarf Champion tomato, etc. Chas. A. Green, in his ornithological report, again champions the cause of the birds as doing more good than injury.

From the county reports we learn that a large part of the large crop of Western New York apples is yet in the growers' hands and ready to put on the market as soon as prices advance sufficiently. Concord, Delaware and Catawba are yet taking the lead among grapes. Niagaras are fine. Worden is a bad shipper; but has been successfully carried long distances when a leaf was put under each cluster in the basket. Among newer strawberries Bubach and Jessie take the lead Wilson is yet the old stand-by. The more barn-yard manure for strawberries, the better the results. Where nothing is done to destroy the crop of worms, the worms destroy the currant crop. Cherries are still a good paying crop. Grapes are easy to produce as insects trouble them but little.

Mr. J. P. White, of Mount Morris, N. Y., tells of his 140 acres of peach orchard. The 30,000 trees are now eight years old, and have given him five crops. The most valuable and profitable varieties with him are Waterloo, Alexander, Early Rivers (all clingstones and very early), Foster, Early Crawford, Oldmixon and Late Crawford. He finds a good market at his own door. The yellows are more serious on rich than on poor soil. Every affected tree is at once cut down and left until spring, then it is removed and disposed of with other orchard trimmings.

Mr. C. M. Hooker, of Monroe county, reports the last strawberry crop poor and light; but higher market prices made up for the inferiority. This seems to have been quite generally the case all through Western New York, and perhaps elsewhere. The peach yellows continues to be destructive; but in spite of it the crops are yet satisfactory and remunerative Evaporated fruits have brought a very low price; yet the industry compares favorably with others in regard to remuneration. Nobody should engage in it, however, who is in a hurry to get rich.

Ontario county, according to Mr. E. Bronson's report, has now reached the point where the fruit crop is larger than all other crops combined. Currants give good profits. The Golden Queen raspberry is quite hardy, and good for home use. No crop is more remunerative than cherries. Windsor is yet among the best of its kind. It sold for 25 cents per pound in Eastern markets. It is free from rot. Imperfect cultivation of available markets, faulty distribution of fruit crops, want of proper sorting and of packing in attractive shape are the chief causes of unremunerative prices. Vermont Beauty is named as a good pear, McIntosh Red and Longfield as good apples, and Yellow St. John as an early yellow-fleshed peach.

Mr. C. H. Perkins, of Newark, a large dealer and exporter, in replying to an inquiry about foreign markets, bitterly censures Western New York methods of packing and shipping, and says Western New York produces and might ship the best fruit in the world, and be well paid. Pony barrels, nail kegs, and packages differing widely in width of head and length of stave won't do. Canada sends uniform barrels holding plump three bushels, and the fine fruit of Western New York should be shipped to Europe in similar uniform packages. When Mr. Perkins has sent his own men to put up the apples, he has made money on them; when he bought apples already put up he generally lost. Members emphasize the necessity of thoroughly shaking the apples when packing for export, and of heaping the barrels more than for domestic market; also of keeping the barrels dry after packing. It is said that Western New York apples for export are often branded "Canada Apples."

Cook's apple-picker (made in Byron, N. Y.) was favorably spoken of by many growers, who think apples can be gathered with it as well as by hand and at half the cost. One of these machines, with five men, in a common orchard, can gather 200 barrels in a day. Price of machine $50. One member says it is as good for pears and plums as for apples; but it takes good men, not green help.

Spraying all fruit trees (not apple only) is urged by Mr. Chas A. Green, who thinks that a spoonful of Paris-green to 40 gallons of water is about the right proportion. Mr. S. D Willard makes his druggist put Paris-green up for him in three-ounce packages he uses one of them to 40 gallons of water, and says it is quite enough.

For the cultivation of plums for market, Mr. S. D. Willard names as requisite "best trees regardless of cost," attention to adaptability of soil, thorough cultivation and liberality in the use of manures, and proper regard to the wants of the available markets. Reine Claude is a fine plum, good for canning, but canneries are hardly ever willing to pay as much as can be got elsewhere. The tree is not a rugged one, and is rather short-lived. It is especially subject to the curculio, hence it is often not profitable. Lombard is good; the newer Stanton gives great promise. The jarring process, if persistently followed for some weeks, will save the crop from the curculio. The spraying method is safe only in very careful hands as the foliage is very sensitive, and subject to injury by burning. Green aphis is bad on plums. Leaf blight is often very destructive. Good culture and properly enriched soil are the best preventives. The knife and fire yet constitute the only known sure remedy for black knot. More care is required in handling plums than is generally given; when properly handled and marketed, the crop will pay. Plum trees in poultry yards are not troubled with curculio. Shallow culture is best. The Horse plum stock is a good one. Mr Willard would not use the Wild Goose stock, or grow Wild Goose plums where better kinds succeed. He believes in setting the trees rather close. The more food you give plum trees, the more and better are the plums. Mr. Green says manure is just the cause of Mr. Willard's success in plum culture.

In an essay on Chautauqua Vineyards, Mr. Watson names Concord as yet leading all other grapes. Worden. Moore's Early, Pocklington, Brighton, and the new Moyer are much liked and grown.

As the best early variety of grapes, prominent grape-men name Moyer, Brighton, Worden, Rogers's No. 14, Wyoming Red, Green Mountain, and Winchell.

The drift of the discussions on "Methods of Cold-storage and Construction of Buildings," indicates that dead-air-spaces have been found superior to sawdust packing, and that building paper is better and cheaper than other materials for partitions between the spaces. By a system of sub-earth ventilation the temperature in a hill-side cellar or storage-room may be kept uniformly at 45 degrees.

Prof. Cook, of Michigan, in an excellent lecture on "Insects and Insecticides," urges the use of London-purple instead of Paris-green or white arsenic—one pound to 200 gallons of water. It should be put on after the blossoms have fallen from the latest tree (Northern Spy). A sufficient quantity of the liquid must be applied with considerable force to make thorough work. He recommends the Field force-pump with the Moody attachment as giving the best satisfaction. It throws the liquid on the trees with a tremendous dash, just as it should. To protect apples against the attacks of the curculio, plant plums in the apple orchard, then spray the plum trees with London-purple solutions repeatedly and thoroughly to save the plums. Spraying is a much better remedy for the curculio than jarring. Another sure remedy for the curculio is a mixture of crude carbolic acid and plaster (one pint to 50 pounds) thrown over the trees. This also is better than jarring. For aphis, apple tree bark louse, scab louse, thrips, etc., Prof. Cook recommends the kerosene emulsion as a sure and safe cure. It is made by churning a quarter of a pound of hard or one quart of soft soap, one pint of kerosene and two quarts of water until an emulsion is formed. This is diluted with water (one to 15) and should be thrown on with force. A carbolic acid emulsion is recommended as a tree wash for keeping out the flat-headed borer, and for killing bark lice and perhaps other insects. Concerted action of peach-growers is needed to fight the peach tree borer with lasting success. The trees should be examined in September and again in May, and the borers should, each time, be cut out. The only sure way of protecting radishes from maggots is to grow them in cold-frames covered with cloth.

The "Canning Industry" was treated by Mr. Curtice of Rochester, who states that the supply of fruits of fine quality does not keep up with the demand. Cherries and plums pay well. The sorts wanted for canning are Bigarreau, Spanish and Napoleon cherries; Imperial Gage, Monroe, Egg and Reine Claude plums; Bartlett pears; Wilson strawberries, Dutch currants; of peaches any good yellow-fleshed fruit, Crawford, Wager, Allen, Foster, etc. Prof. Caldwell, of Cornell University, in the Report of the Committee on "Chemistry" spoke strongly in favor of nitrates, as also did Mr. Joseph Harris in his paper on "Manures for the Orchard and Garden." Nitrates should be applied in small quantities, and only as fast as the plants can take them up. With sulphate of ammonia, however, there is little danger of loss.

As it is expected that the incoming administration will appoint a new Commissioner or a Secretary of Agriculture, the society by unanimous vote recommended Mr. J. S. Woodward, of Lockport, for the position.

A Convincing Quintette.

We want to make several statements in regard to Compound Oxygen but are restrained to limits of time and space.

In other words you have not the time and we lack the space, so we stand aside for our patients. Observe what they say of us:

Mrs. S. M. Anthony in reply to query in the Housekeeper, of Minneapolis, Minn., issue of July 15, 1888.

Mrs. W. E. Eddy.—"I have used Compound Oxygen several years for lung trouble. I believe it will cure consumption if taken in time. Durhamville, Mrs. S. M. Anthony.

Philadelphia, Pa., April 15, 1885.
"To make a long story short, my health was fully restored"

Editor of *Lutheran Observer.*

Rochester, N Y., Jan. 11, 1884.
"I began the use of Compound Oxygen and have much reason to be grateful for it."
Rev. Chas. W. Cushing.

Philadelphia, Pa.
"Thanking you for renewed health, strength, and the hope of years of comfortable life, I remain your grateful friend."
Hon. Wm. D. Kelley.

Chicago, Ill., April 24, 1886.
"You ask my opinion of Compound Oxygen; perseveringly and continuously used, it will work wonders.—*Chicago Inter-Ocean.*
William Penn Nixon.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing Drs. Starkey & Palen, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery St., San Francisco, Cal.—*Adv.*

The Garden.

SMALL FRUITS FOR FAMILY USE.

PRES. T. T. LYON.

A List of fruits selected for home use, should, beyond question, be chosen with primary reference to quality. Vigor, productiveness, size and beauty are all desirable qualities, even for the purpose specified; still the children's clubs will find lodgment in the "best tree," rather than in that yielding the largest or most beautiful fruit.

THE STRAWBERRY.

This must, of course, head the list, as the earliest of fruits. There are a number of very early varieties of fair quality but so very small or so persistently unproductive as to be essentially disqualified for a place on even the family list. The earliest fairly productive berry of good quality, among the more than 200 varieties which I have tested, so far, is Alpha, a seedling of the late Charles Arnold, of Ontario, Canada. Duncan is another older variety, of fine quality, satisfactory size and productiveness, which closely follows, and occasionally even precedes the foregoing. If we follow these with Bidwell, Bubach, Belmont and Mount Vernon, with perhaps Wilson for canning, the season for this fruit may be made to last at least four weeks; or, in latitude 43°, from June 1st to July 1st; possibly longer.

RED RASPBERRIES.

The earliest of these in most seasons, is Hansell, closely followed by the sweet and delicate Turner. These followed by Cuthbert and a few plants of Golden Queen, for variety of color, will fully cover the season of this fruit. I am not a little surprised to learn that so sound and judicious a horticulturist as President Smith, of the Wisconsin Horticultural Society, puts forward the, with me, third or fourth-quality, Marlboro, for home use. I regard it as scarcely fit for the market, save, perhaps, in appearance.

BLACK-CAPS.

These will be in season with the later red raspberry. The earliest is Souhegan or Tyler, the two being, for all practical purposes, identical. The old Doolittle is, however, but two or three days later; while it is in most respects superior. Follow these with Hilborn for the medium crop, and close the season with Mammoth Cluster, and perhaps Nemaha. Gregg, which is by some commended for home use, is a typical, low-grade, market berry, dry and poor in flavor, with only size and ability to bear rough handling to recommend it. New Rochelle and Shaffer are purple varieties akin to the black-caps, and ripening with them. Although not attractive in color, they are of good quality and of especial value for canning.

DEWBERRIES

are in season nearly with the earlier black-caps, continuing till the advent of their near relation the blackberry. The only variety yet generally successful is the Lucretia.

THE BLACKBERRY

season commences before the raspberries are past, and practically closes the season of the cultivated small fruits, if we except currants and gooseberries. Early Harvest is the first to ripen. There is a wide difference as to the hardiness, and consequently as to the value of this variety. In Southern Illinois, where it is said to have originated, it is hardy; while in Michigan, and many other localities, both East and West, it proves to be extremely tender. This discrepancy may perchance be explained, by supposing, as it is alleged, that Brunton—a similarly early, but tender variety—has been disseminated under this name. Kittatinny is the largest and best variety available to take the second place on the list; but it will require protection against very low winter temperatures Ancient Briton will perhaps take this place at the West, where greater hardiness is required, although it has a tendency to excessive productiveness, and the fruits are consequently liable to be small. Taylor, as the latest good variety, will close the blackberry season. It is hardy in production and of excellent flavor.

CURRANTS

are in season with the later raspberries and blackberries, and are usually used in a green state even earlier. Modern improvements of this fruit are only manifest in increased size. Red Dutch, one of the oldest varieties, still claims the meed, among old varieties, of superior quality; while White Dutch successfully asserts its claim to superiority over all others for rich mild flavor. Victoria is slightly later in ripening, and for this reason, and on account of its comparative exemption from the attacks of the borer, it may properly fill a niche in the list for family use. White Grape is slightly larger than White Dutch, but of lower quality. This, together with Cherry, Versaillaise, and perhaps the new Fay currant also, is mainly valued as a market variety, whose superior size attracts the fancy of the greedy city purchaser.

GOOSEBERRIES

correspond, in season with currants. Although almost universally used before ripening, it is believed that they would be found even more desirable if allowed to ripen before they are used. The large and attractive En-

When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

glish varieties prove unfitted to our hot, dry, summer climate, being more or less liable to mildew of the foliage as well as fruit. Houghton is the earliest of the American varieties, but is small in size. Smith is a larger fruit, of excellent quality, although the plant is somewhat lacking in vigor. Downing is of a more vigorous, spreading habit, and very thorny, indicating a possible cross-hybridization with a foreign variety. Industry is a foreign variety, which is commended by very high authority as capable of resisting mildew in our climate; but time is requisite to properly test its capacity in this respect.

Van Buren Co., Mich.

SAVED.—Over six thousand creamerymen have been saved from ruinous prices by the use of Thatcher's Orange Butter Color; it is used from Maine to Georgia, from the Atlantic to the Pacific.—*Adv.*

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

WE decline to respect the man who can't find time to plant vegetables for home consumption. It is a lamentable fact that many country families go without all early vegetables because the head of the house wont take time and trouble to put into shape a suitable piece of ground for a garden when the "women folk" stand ready and are willing to plant the seed. It is a penny-wise-and-pound-foolish policy that we have small patience with, and we can't help wishing that such men were fed three times a day for three hundred and sixty-five days in the year on pork and potatoes, bread and molasses! But no, the wives of just such men will scour the fields for dock, cowslips and dandelions, that they may set before their "lords and masters" a *dish of greens*! And then with what eagerness these same good souls watch the growth of the early apples that "he" may be treated to his favorite pie; for his appetite is not good and he wants a change. How many test trips are made to the corn lot lest the field corn should harden before "His Highness" has had his fill of roasting ears! Is it a wonder that the wives and daughters of some country men fail to see the bright side of farm life? A good supply of vegetables in succession materially lessens the housekeeper's burden. We know it doesn't if one pair of hands, in addition to other duties, must pick and shell peas for a lot of hungry men or go to the lower lot for corn, but the man who supplies his wife with vegetables and fruits, usually sees her supplied with needful assistance too.

VEGETABLES.

TIMELY, TRIED AND TRUSTWORTHY.

ASPARAGUS.

CUT the stalks of equal length, rejecting the woody parts. Tie into bunches with tape, or in a piece of coarse net and put into boiling, salted water. Boil from 20 to 35 minutes according to age. Before it is done toast a few slices of bread, dip into the liquor in which the asparagus is boiling, butter and lay on a hot dish. Drain the asparagus, untie the bunches and place upon the toast with a few bits of butter. A favorite accompaniment to boiled asparagus is a white sauce as follows: Two ounces of butter, one ounce of flour, a small tea-cupful of milk, two tablespoonfuls of cream and a tea-spoonful of salt. In a saucepan mix the flour and butter, add by degrees a-half pint of boiling water. Stir until the mixture boils, add the milk, boil two minutes longer, season with salt, take from the fire, stir in the cream and pour over the asparagus, or serve in a gravy-boat.

When eggs are plentiful prepare in this wise: Cut as many tender stalks as you will need into half-inch bits, boil in salted water 20 minutes, drain, pour over a cup of rich drawn-butter and turn into a buttered pudding-dish. Break a half-dozen eggs, or as many as required, carefully over the surface, strew over bits of butter, season with salt and pepper and put into a quick oven until the eggs are set. Serve at once. Or make an omelette as follows: the green part only of a good-sized bunch of cold, boiled asparagus, a half-dozen eggs beaten very light, two tablespoonfuls of milk and a little salt. Chop the asparagus very fine, stir in the beaten egg and milk. Put a tablespoonful of butter in a frying-pan, heat and pour in the mixture; shake and loosen with a broad knife as it forms. Fold over in the middle and turn upside down upon a hot platter.

A tempting way of serving plain boiled asparagus is as a salad. Boil, untie carefully, place upon a flat dish and make very cold by standing in the ice-box. Serve with a dressing of vinegar, pepper, salt and salad oil.

STEWED.—Cut into bits, rejecting the hard part, and cook slowly in milk until tender. Season liberally with butter, pepper and salt.

BEANS, LIMA.

BOIL in a little water until tender, drain, add a cup or more, according to the quantity, of thin cream. Boil up and season. Delicious.

BEETS.

WASH carefully and do not break or cut the skin. Boil until perfectly tender. Remove the skin, cut into thin slices and serve with pepper, salt and vinegar, or make a drawn-butter sauce and turn over just before sending to the table.

CABBAGE.

SELECT a crisp head. Cut into shreds and cook until tender. Turn off the water, add a little milk, a lump of butter, pepper and salt. Bring to a boil and serve. Very nice if cooked until perfectly tender.

CARROTS.

SCRAPE, wash, and boil with corned beef. Serve cut into lengths as a garnish around the meat. Or, cook in salted water until tender, take out, cut into bits and cover with a sauce made of milk and butter, slightly thickened with a little corn-starch and seasoned with salt and pepper.

CAULIFLOWER.

CUT off the outside leaves and let stand in salt and water for an hour or more. Put the head into a piece of net and boil until tender. Put a pint of milk into a sauce-pan, bring to a boil, add a lump of butter, a little thickening, a half cup of grated cheese and salt to season. Arrange the cauliflower on a flat dish and pour the sauce over it.

CELERY.

CUT into inch lengths and stew until tender. Drain off the water, and just cover with sweet milk. When it begins to boil, thicken with a lump of flour and butter rolled together, season with pepper and salt and boil a few minutes longer.

CORN.

BOIL as soon as taken from the stalk, if sweetness is a consideration. Making a corn pudding is a favorite way of serving this excellent vegetable. Use while tender. Draw a sharp knife through each row lengthwise and scrape out the pulp. To a pint of the pulp add a quart of milk, three beaten eggs and a lump of butter. Put into a moderately hot oven and stir until it begins to thicken, then add salt to season and bake until lightly browned. Time an hour and a half in a moderate oven.

CUCUMBERS.

PARE and place in cold or ice water for an hour. Cut lengthwise into half-inch slices. Dry on a cloth, sprinkle with pepper and salt, and dredge with flour. Fry to a delicate brown in butter or dripping.

EGG PLANT.

PEEL, cut in thin slices, sprinkle with salt and let drain for an hour. Dip the slices, first in beaten egg and then in cracker dust and fry in as little butter or dripping as possible.

ONIONS.

BAKED.—Wash and skin very large onions. Parboil half an hour, drain, push out the hearts, chopping them fine with a little bacon, add bread crumbs, season with pepper and salt, and moisten with a little cream. Fill the onions with this, put into a dripping-pan with a very little water, and cook until tender in a slow oven, basting often with melted butter. Stewed.—Select small ones of the same size Skin and throw into cold water. After an hour put on to boil, when half done drain, again cover with water. When tender, turn off the water, and add a cup of milk, a piece of butter, and season with pepper and salt.

PARSNIPS.

Scrape, and if large, cut in halves, boil in salted water until tender. Mash, and to a quart of the mixture, add two beaten eggs, a tablespoonful of flour, and salt and pepper to taste. Form the mixture, when cool, into small cakes, and fry brown, turning, in a little butter. Or, cook until tender, cut in rather thick slices, dredge with flour and fry until brown. Season.

SPINACH.

Look over carefully, picking the leaves from the stems. Wash and cook 30 minutes in salted water. Drain chop fine return to the fire, season with butter, pepper and salt, press into a mold or bowl, turn out and garnish with sliced egg.

TOMATOES.

BAKED.—Scald and peel a sufficient number of smooth round tomatoes; put into a deep earthenware dish, sprinkle plentifully with salt and pepper; have a teacupful or more—according to the quantity of tomatoes—of fine cracker crumbs, and spread over the top. Bake in a quick oven from 30 to 45 minutes. Drop a few lumps of butter into the tomatoes and serve.

GREEN.—Slice thin, roll in flour, season with salt and pepper and fry in hot butter.

ON THE HALF-SHELL.—Have toasted a few slices of bread nice and brown; butter, cut in halves, and place where it is warm. Select tomatoes which are smooth, and not over-ripe; cut in two—flat-wise—and put, skin down, on a hot gridiron. Cook slowly until done through. Serve on the slices of toast with butter, pepper and salt.

SALAD.—Skin, remove the seeds and pulp from fresh tomatoes, chop what is left with the heart—if it may be so called—of a cabbage and a little parsley, and serve with a good salad dressing.

SCALLOPED.—Peel as many ripe tomatoes as required; cut into slices, and place in a pudding dish first, a layer of tomatoes, seasoned with butter, pepper and salt, then a thick layer of crumbs, also seasoned with butter, pepper and salt. Thus alternate the layers until the dish is nearly full, having tomatoes last; cover tightly, and bake one hour or longer if the oven be not hot.

SOFT water is better than hard for cooking vegetables. If the water is very hard, add a pinch of soda.

When boiling cabbage, drop a piece of charcoal into the water. It will lessen the unpleasant odor.

To preserve the color of vegetables, French cooks add to the water in which they are boiled as much carbonate of ammonia as can be taken up on the point of a penknife.

Miscellaneous Advertising.

VERY OFTEN

Life has been saved by a bottle of

AYER'S Cherry Pectoral

The best emergency medicine, it should be within reach of every one, young and old.

"Several years ago, on a passage home from California, by water, I contracted so severe a cold that for some days I was confined to my state-room, and a physician on board considered my life in danger. Happening to have a bottle of Ayer's Cherry Pectoral, I used it freely, and my lungs were soon restored to a sound and healthy condition. Since then I have invariably used and recommended this preparation, and always with beneficial results."—J. B. Chandler, Junction, Va.

Prepared by Dr. J. C. Ayer & Co., Lowell, Mass. Price $1. Six bottles, $5. Worth $5 a bottle.

HOME NEWS.

SATURDAY, February 23, 1889.

HAIL! ALL HAIL!! to the four new members added to the glorious sisterhood of States on Washington's Birthday, 1889! Hail, all hail! to North Dakota, South Dakota, Montana and Washington, the lusty new additions to the Union one and indivisible.

AGRICULTURAL NEWS.

SATURDAY, February 23, 1889.

SENATOR Spooner, of Wisconsin, has introduced into Congress a bill which proposes to establish a system of farm institutes, to be held annually in the different States. They are to be under the direction of a Superintendent of Institutes, with a salary of $6,000 a year. He is to have two Assistant Superintendents at $4,000 apiece a year, and 15 district clerks at $3,000 each per annum. The scheme embraces lectures, instructions, experiments, illustrations and agricultural discussions, and the Superintendent is to have authority to hire lecturers at fair rates of compensation for the time actually employed. After the circuit of Institutes is completed every year, the Superintendent is to publish reports of the proceedings. The circulation of these reports is to be limited to 1,000,000 copies a year. Exclusive of the cost of maintaining this publication, an assistant account amounting to $59,000 a year, the annual expenses of conducting the Institutes are not to exceed $500,000. The system is to be under control of the new Department of Agriculture, but it will require a strong expression of opinion on the part of the farmers of the country to secure its establishment..... At last a bill is now pending before the New York legislature providing for an official inspection and analysis of all fertilizers offered for sale in this State. Of course, it should pass..... There is considerable trouble among the barbed-wire fence monopolists. It has lately been discovered that Louis Janin took out a patent on barbs for wire fences as long ago as 1865, in France. Under our patent laws no invention or discovery can be patended in this country, which was patented or published in any other country two years before the application for a patent for it was made here. The chief patent of the monopolists embraces a "broad claim," covering all forms of barbed-wire fencing, and the Janin patent must be fatal to this. Of course, the matter will be contested to the "bitter end," and owing to the slowness of the law, especially before the United States Supreme Court, it is likely that it will take four or five years to obtain a final decision. The "broad claim" patent will then have nearly expired. Washburn & Moen, the arch-monopolists, hold over 100 other patents on barbs, fencing and machinery, so that they are likely to have a great advantage over other manufacturers for years to come..... .. St. Clair county, Missouri, incurred a heavy debt some years ago, to aid in railroad building. It is now trying to get rid of its obligations. Some time back it refused any longer to pay interest on the bonds it issued to pay its subscription to the road, and the United States Court to which the bond-holders took the case, ordered Judge Peters, of St Clair county, to levy a special tax to pay the interest on the bonds. The Judge, backed up by the inhabitants, refused to do so, and for his refusal he has just been arrested by United States officers for "contempt of court." Such attempts to repudiate debts incurred in aiding in the construction of railroads have been very frequent of late in many towns and counties in the West and Southwest..... There's trouble in the beet-sugar business in California Last season Claus Spreckels's factory, at Watsonville, paid only 25 cents per bushel for beets containing the highest percentage of sugar, and only from 10 to 12 cents per bushel for the average crop. Land thereabouts is worth from $300 to $500 per acre, and only half the number of farmers who grew beets last year are willing to make contracts for this year. Spreckels threatens to close the factory and take the machinery elsewhere. He intends to build his next factory in Shasta or Tehama county in Northern California, where land is only $30 an acre, and where therefore he can raise his own beets if necessary..... At a convention of nearly 300 growers of the Niagara grape, held at Rochester, N. Y., the other day, a stock company was formed, with a capital stock of $10,000 in shares of $1 each, stock-holders to be allowed one share for each acre of Niagaras they may grow .. .... Prof. F. Lamson Scribner, late Chief of the Section of Vegetable Pathology of the Botanical Division of the United States Department of Agriculture, is now Director of the National Agricultural Experiment Station of the University of Tennessee, at Knoxville..... .... The planters of Wayne County, N. C., are up in arms to prevent negroes from leaving that section to work in other States. All the emigrant agents have been driven away; two companies of militia have been called out; 1,500 negro emigrants who have sold everything, are at the railroad station at Goldsboro, waiting for the fleeing agents to furnish transportation. More trouble is feared as the planters are mad at the danger that they will be left without help enough to take care of their crops.....Professor A. J. Denton goes direct from post-graduate work in the botanical department of Harvard University, Cambridge, Massachusetts, where he held a Fellowship in Science, to take the Chair of Botany in the Colorado Agricultural College at Fort Collins.... ... Large shipments of Western corn are being made into different parts of the South ... ... Old-time cattle dealers, with recollections of the trade running back 30 years or more, say that prices of beef are the lowest within that period for the winter seasons ....Philip Armour, the butcher king of Chicago, has thrown the meat-market men of St. Louis into consternation by opening five markets in the busiest part of the city, with more to follow..... The Massachussetts agricultural and finance committees have both reported in favor of an additional annual appropriation of $10,000 for a labor fund and new professorships at the Agricultural College..... Mr. J. William Belcher has retired from the firm of B. & J. W. Belcher of Chicopee Falls, Mass. The business will be continued by Benj. E. and J Wilson Belcher under the same firm name. The firm will make a speciality of the "See, Bee Won" (formerly known as the Brooks) swivel plow with an improved shitting clevis.. During the last session of Congress bills were introduced in the House "to punish dealing in futures in agricultural products" and "to prohibit fictitious and gambling transactions on the price of articles produced by American farm industry." The bills were referred to the Committee on Agriculture, which heard arguments in their support Last Wednesday the Committee decided to report against both bills on the ground that Congress has no jurisdiction over the subject; that the limitations imposed by the Consitution make it improper for Congress to pass the proposed measure, and that it is a matter for State legislation exclusively..... At the 22nd convention of the American Pomological Society which opened its sessions last Wednesday, amid much local enthusiasm, at Ocala, Fla., Prosper J. Berckmans of Georgia, was re-elected President; while T. T. Lyons, of Michigan, was chosen first Vice-president; B. G. Smith, of Massachusetts, Treasurer; and A. A. Crozier, of the Iowa Experiment Station, Secretary..... .. The French Chamber of Commerce has adopted resolutions urging the importance of steps being taken to increase the export of Canadian butter to Europe. Of late France has been doing a great deal to secure the good-will of the French of Lower Canada; but Upper Canada would be the chief gainer by the increase of the Dominion's foreign butter trade..... Members of the Canadian Pork Packers' Association claim to have assurance that the duty on American lard is to be increased. If this change is made several Canadian firms are prepared to furnish a new article composed of 90 per cent. of the best prime lard and 10 per cent. of lard stearine, which they claim is superior to the "juggled concoction" now called American refined lard.....

LATEST MARKETS.

NEW YORK, Saturday, February 23, 1889.

GRAIN MARKETS

WHEAT.—The market is slow with light demand from millers. Very little export trade. Sales of No. 2 red at 99½ cents to $1.01¼, and of No. 3 red at 94 cents.

RYE.—The market is very dull. Quotations are 55 to 59 cents for State, 52 to 57 cents for Western.

BARLEY.—Quoted at 70 to 72 cents for two-rowed State; Canada ungraded, at 78 to 81 cents.

CORN.—The price has been somewhat lower, but prospects are good for an advance. Sales of Steamer white at 42½ to 43 cents; Steamer yellow 42¼ cents; ungraded, 40¼ to 44¾ cents.

OATS.—Market firmer; sales of White from 30 to 39 c.; mixed 28 to 32½ c.

BUCKWHEAT.—50 to 52 c.

BEANS.—Market strong at outside quotations. Marrows, $2.20; Mediums, $1.75 to $1.80; Pea, $1.75 to $1.80; Red Kidneys, $2.00 to $2.05; White Kidneys, $2.30 to 2.35; California Limas, $2.75 to $3.00.

FRUITS.—Fresh. Apples are in good supply, but best grades equal or exceed outside quotations. Best Spitzenburgs, Spies and Greenings, bring $1.50 to $2.00 per barrel but common grades range down to $1.00, and even lower. Catawba grapes are quoted at three to four cents per pound. Cranberries from 75 cents to $2.00 per box. Florida oranges range from $2.25 to $3 25 per box. Strawberries 50 cents to $1,25 per quart. Dried fruits are very quiet. Evaporated apples are from four to six cents; raspberries 17 to 19 cents; peaches from five cents for unpeeled to 18 cents for best peeled, evaporated.

VEGETABLES.—Potatoes and onions continue in good supply Onions are unchanged except white, which are a trifle higher. Potatoes are quoted from 80 cents to $2.00 per barrel; Sweets $2.25 to $4.00; Cabbage $3 50 to 4.50 per 100; Kale 40 to 80 cents per barrel; Spinach $1 50 to $2.25; and Turnips 30 to 45 cents per barrel. Red Onions are from 45 cents to $1.00 per barrel, yellow, 80 cents to $1.00, and white $2.50 to $3 50.

BUTTER.—The market is well supplied with all grades, and prices show little change. Pennsylvania and Elgin best from 29½ to 31c.; State dairy from 18 to 27c.; Imitation Creamery from 19 to 23c.; Western dairy from 13 to 20c.; while poor butter is sold as low as 12c.

EGGS.—The colder weather has stiffened the market, but prices remain low for the time of year Nearby, fresh gathered, 14½ to 14¾c. Fall packed 10 to 11c., and limed 9 to 11.

SHEEP AND LAMBS.—Heavy receipts have given the market a very dull tone, with lower prices. Sheep sold at 3¾ to 5⅝ cents per pound; lambs at 5½ to 7⅛ cents.

CALVES.—Moderate receipts, and prices about steady, at 6 to 8½ cents per pound for veals, and 2¾ to 3¾ cents for others.

THE COOLEY CREAMER

AGAIN PROVES ITS

SUPERIORITY OVER EVERY OTHER APPARATUS

AS A CREAM RAISER AND SEPARATOR.

The **ANALYSIS** of the **SKIMMED MILK** at the Granite State Dairymen's Association's Annual Meeting, Jan. 8th-10th, shows that the **COOLEY CREAMER** got the cream from the milk the most thoroughly, the next nearest competitor had 12¼ per cent. more butter fat left in the skimmed milk. The **CENTRIFUGAL SEPARATOR** had 32½ per cent. more butter fat left in the skimmed milk, proving conclusively that the **COOLEY CREAMER** is the best **Cream Raiser** or **Separator.**

This agrees with test made by the committee at Amherst, Mass. Creamery in Oct., 1882, when the skimmed milk from the **COOLEY CREAMER** analyzed by **Prof. Goessmann** of MASS. AGRICULTURAL COLLEGE showed that the **COOLEY SUBMERGED CREAMER** was the best **Cream Raiser** or **Separator.**

Also with **Prof. Short,** of WISCONSIN AGRICULTURAL COLLEGE, who tells the Farmers of his state: **"Submerged setting of milk is preferable to any other system;** as, if the milk is submerged promptly as soon as drawn from the cow, and the water kept cold, it produces more cream than by any other process, and prevents contamination by any impurities in the atmosphere."

The above confirm all public tests.

The **COOLEY CREAMER** always shows that it extracts the cream from the milk **more thoroughly** than any other apparatus, and consequently makes the most butter. **SEND FOR CIRCULARS GIVING FULL PARTICULARS.**

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD.

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

THE meal came to an end all too soon, and with many a sigh of satisfaction, the boarders filed out of the room. Jim Foster informed Mrs. McKelvey that he was "getting fat enough to kill." He considered this the highest compliment he could possibly give to her cooking.

Jack Gray had been remarkably silent during the meal. The men had all noticed it. After breakfast, he walked slowly down the street with his hands in his pockets, and halted in front of Sarcy Sal's house, glancing hesitatingly up and down the street. There was no one in sight, so he walked carelessly through the yard, and entered the house without ceremony, and knocked at the door of the inner room.

The door was opened by little Mamie. She looked up at him with something of fear in her face.

"Whar's your marm, little gal?" asked Jack in his pleasantest tone.

"She's in here," said Mamie doubtfully, and a weak voice on the inside called, "Come in, Jack."

Jack pushed the door open and passed in. He did not take off his hat as he would have done in the presence of Mrs. McKelvey. At a gesture from the woman, he brought a chair up to the side of the bed, and sat down.

Little Mamie stood near the foot of the bed, with her finger in her mouth, looking at him with great distrust.

Jack sat and looked at the woman in silence for a time. "Wall, Sal, how be ye?" he said at last.

"I don't know, Jack," she answered feebly, "I don't think I shall ever get well. I wish it was all over," and she turned wearily on the pillow.

Jack could offer no consolation. "I s'pose yer right Sal," was all he could say.

"Say, Jack," she said after a pause, "Who is this new Parson? What's his name?"

"The new Parson," said Jack contemptuously, "is the biggest fool that ever struck Drum Lake. It beats all. He don't know enough to pound sand into a rat-hole. He don't know nothin'. He's gut some four-story name, jest about three times as big ez he is."

"It isn't Grayling, is it?" whispered the trembling woman.

"Some sech name ez that—a little bunched-up chap—but what's the matter with ye Sal?" he asked almost kindly as the woman covered her face with her hands, and burst into tears. "Ye ain't thinkin' of goin' to his church be ye."

"Yes, Jack, I think I will go. You won't let them hurt me, will you?" and she held out her hands appealingly to the rough man.

"They won't hurt ye," Jack said kindly. "There won't be nothin' there ter hurt ye, 'cept its the Parson's sermon. I'm sorry ter see yer so bad, Sal. Yer way down ter the end of the rope, but I wish I could pull ye up. I don't s'pose I kin though. I don't s'pose nobody kin."

The wretched woman buried her face in the pillow without a word. Jack tilted back in his chair to watch her, while little Mamie came and held her mother's hand.

"I say, Sal," broke in Jack at last, "what a terrible pretty woman you *might* hev been. Yes" he added, slowly, "terrible pretty, an' good too."

The weeping woman shuddered, yet she did not speak, for she was thinking of what might have been. She might have been a good woman. She might have made the minister's life a success. She might have made this man before her a better man. She might have done it, and all three knew it well.

Jack was talking as he had not talked for years. I doubt if he ever spoke in like manner again.

"It beats all what you wimmen cud do ef ye would only be *wimmen*. Ye cud lead us right up ter death without winkin' ef ye only wanted ter. But ye don't want ter, an' so we loses faith in ye. A dry goods clerk wavin' a bottle of perfumery kin draw nine out of ten gals away from the men they orter be bracin' up. When a real woman comes along, she's ketched up afore we poor fellers has any show. But what be I talking about? Here I be goin' on ter preach a sermon. Guess I'll quit afore I gets ter takin' Parson's bizness away frum him," and Jack started up ashamed to think that he had spoken so freely.

He stopped at the door. "I'm sorry for ye, Sal, an' I wist ye could brace up, but I don't s'pose ye ever kin. Yer too low down fer that. But ef ye ever wants any kelp, jest let me know."

The Rev. Mr. Grayling waited long and patiently for the coming of his choir. The organization did not put in an appearance, and at last he went down to ask Mrs. McKelvey's advice.

The good English woman did not like to tell him how he had been imposed upon, so she gave some imaginary reason for the non-appearance of the singers, and finally gave him to understand that they probably would not be able to come at all.

The minister was very sorry for he had hoped to make the musical part of his service very attractive. He looked so sorrowful that Mrs. McKelvey's heart was touched.

"I'll tell ye what I'll do," she said. "Them Chase gals is great singers, an' p'raps we kin git 'em to come and sing fer 'e. Run down an' see, Bill."

Mr. McKelvey gladly started on this errand of mercy. He was glad to show Drum Lake what he could do in the way of clothes when he fairly put his mind to it. For the first time in many years, he had resurrected the long black coat and high cravat that formed part of his Sunday suit in England, years before.

Mr. McKelvey felt that he had filled a somewhat inferior position in Drum Lake society so far. To-day he proposed to show his fellow-citizens just what his proper sphere was. His clothes were not perhaps all they might have been, yet they were a step in advance at least. The great collar looked out most solemnly through his thick beard. Time had written deep wrinkles on the long coat, and Mr. McKelvey had grown portly of late years. By a desperate effort he had succeeded in buttoning the garment about him, but the seam at the back was put to such tremendous work that it seemed gasping for breath.

The Parson went back to the audience room to complete his arrangements. He arranged the rude benches, and fastened back a spray of evergreens that had fallen down over one of the windows. It was not long before a curious stumping on the stairs warned him of the approach of some visitor. He opened the door and peered down the narrow passage.

Mr. McKelvey and two women stood at the entrance. The black coat and collar had evidently proved too much for the "Chase gals."

"Ere we be, Parson," announced Mr. McKelvey. "Parson; this 'ere is Miss Lucy Chase, Parson, Miss Mary Chase." Mr. McKelvey did his best to make the introduction in the most approved style. His tight coat was against him, but he did his best.

The Parson bowed gravely to his new friends. The outside appearance of the new choir was hardly more prepossessing than that of the old one. Miss Mary was a cripple, and walked by the aid of a crutch. Her face was thin and sharp, and seemed to give one notice that her tongue was as keen as a razor. Miss Lucy's face was disfigured by small-pox. They both wore flaming red hoods on their heads and great, cloth mittens on their hands

But Mr. Grayling was too much of a gentleman to let the ladies see that he considered them ill-looking. "I am glad you are come, ladies," he said gravely. "Perhaps it will be well for us to look over our music, a little."

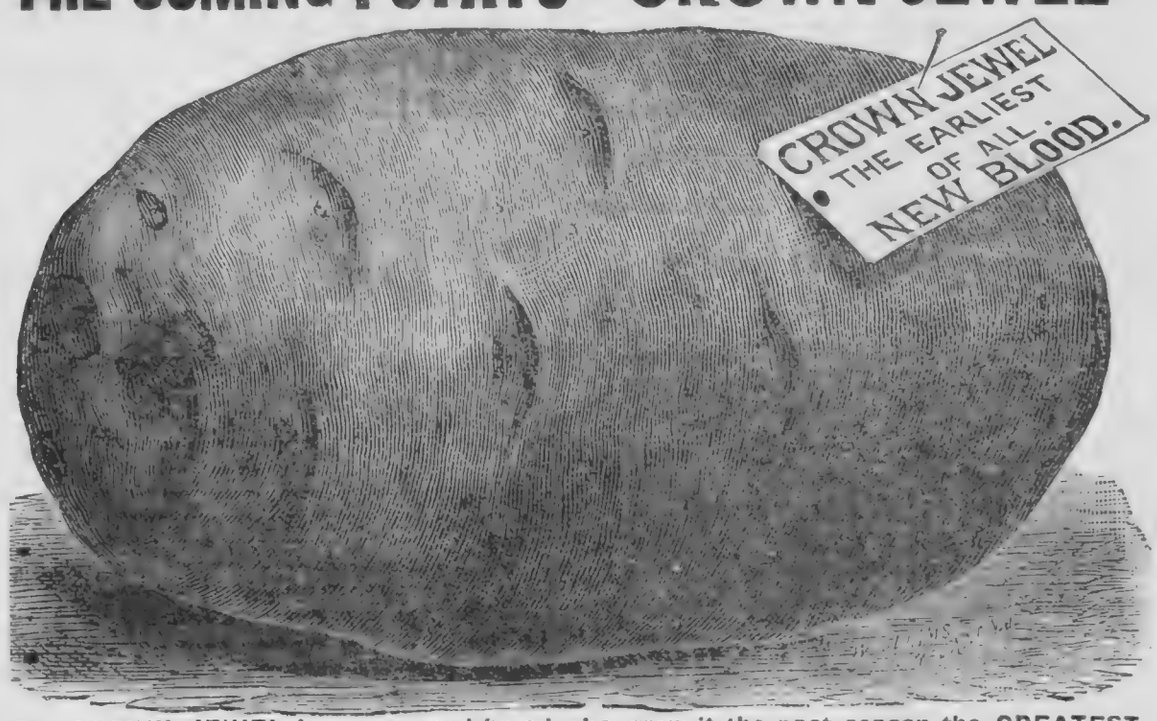
THE COMING POTATO "CROWN JEWEL"



The CROWN JEWEL is pronounced by all who grew it the past season the GREATEST POTATO INTRODUCED SINCE THE EARLY ROSE, yielding in all cases where grown on a large scale from 500 to 625 bushels to the acre, and on the grounds of the "RURAL NEW YORKER," (see report of Potato trials published in that paper) at the rate of 726 bushels per acre--grown in competition with Early Ohio, Early Rose, Sunrise and other popular varieties, it more than doubled the yield of any of them and was ready to dig fully a week earlier. A strikingly beautiful Potato of finest table quality. The vines grow vigorously, roots extending very deeply into the ground thus resisting drought. PRICES: Per lb. 40c. 3 lbs. $1.00 by mail postage paid. Peck $1.00; bushel $3.00; barrel $7.00. Order now. Our GARDEN AND FARM MANUAL FOR 1889, accompanies all orders. Farm Topics.

TO RENEW THE USEFULNESS OF AN OLD GRINDSTONE.

It is often the case that the farm grindstone is in such a sadly demoralized condition, that it is an utter impossibility to do a satisfactory job of grinding on it. This need not be the case if the owner be willing to take a few spare hours some rainy day to put it in perfect condition. I have just finished such a job, making a new frame and dressing into perfect shape an old stone which had a flat side requiring the removal of three-quarters of an inch from the edge, to bring it to a perfect circle. There was no expense whatever except the price of the few nails used in making the frame.

First ascertain whether the stone hangs plumb, by getting some one to turn it slowly while you examine it. If it wobbles sidewise while turning, you will then have to remove the crank pinion and clamps and make a new block for the square hole in the center of the stone. This should be made with care, and the hole should be quite square. For a two-inch stone a piece from the end of a scantling will answer. When of the shape and size required, draw two lines from opposite corners of the block, and the spot where they cross will be the exact center. Place it in a vice and bore an inch hole straight through Put it in the stone, replace the clamps and pinion; screw up snug and again test the stone. It should run "plumb-steady." If it does not, any little irregularity can be corrected by unscrewing a little and placing pieces of leather between the edge of the clamps and the stone. Do not be satisfied till it is perfect in this respect.

Now to dress down the stone: first mark a perfect circle on each side of it near the edge. To do this, find the side and spot where the stone is most worn; then take a scratch-awl or any sharp-pointed tool and hold it flat and firmly on the frame at the side of the stone so that the point will just touch the edge at the point most worn. Now turn the stone carefully and the point will scratch a perfect circle and show the part to be removed. Repeat the operation on the other side. The stone is now ready to be dressed, and all you will need is a two-foot section of an old scythe blade or corn-cutter. Sit astride the frame with the stone against your chest, and shave off that part outside the marked circles just as you would use a drawing-knife on a stick of hard wood, and you will be surprised at the speed and effectiveness of the operation. First shave off the corners, then the center, and so continue, constantly changing the angle of the blade and the direction of the cut, change also the part of the knife used, occasionally, so as always to have a sharp cutting edge. Draw the knife with a slanting, cutting motion, not with a square, dead pull. If you have ever tried any other means, you will at once see the advantage of this method. No doubt some will smile at the idea of cutting stone with a knife, but remember "the test of the the pudding is in the eating"—try it. After you have carefully removed all down to the circles, there will still be some slight irregularities. To remove these, take a piece of soft iron as wide as the face of the stone, and having some one to turn the latter, hold the iron firmly against the face of the stone so that each revolution will remove the rough places. In a short time the iron will touch the stone all the way around, and the job is done, and your stone should run as steadily as a balance-wheel. Then take care of it. Don't allow it to stand out exposed to the weather with one side in the water, for if you do it will be softer on that side and will wear faster. Having your stone in good running order, do not fail to attach a treadle, for it will then run quite easily, and you can do a good job. Do not, if you can avoid it, impress the small boy into your service, for no job is more irksome to him than turning the grindstone unless it be operating the old dasher churn.

GEO. O. GRIDLEY.

"MONEY IN SMALL FRUITS."

"The whole story," as told the past winter by J. H. HALE, in Lectures before vast audiences at the Farm Institutes of Wisconsin and New York, and Maine, is published for first time in our **FREE CATALOGUE,** which also describes **ALL** the **Best NEW** and **OLD varieties** of **SMALL FRUIT PLANTS** grown from **pedigree stock.**

EARHART RASPBERRY the wonderful ever-bearing black cap, has now been **tested** over the whole country. *"Would fruit the whole year through if it had a chance." "Six quarts to a plant." "Just ropes of berries,"* etc., are some of the reports that come to us; and it is not surprising, as it is a prize for any family garden; and for three years past we have been unable to supply the demands for plants. Send postal at once for **FREE CATALOGUE** to **FRUITS FROM JUNE TO NOVEMBER** HALE BROTHERS, SOUTH GLASTONBURY, Conn.

850,000 GRAPE VINES

100 VARIETIES. Headquarters of the **MOYER,** the Earliest and Best. Reliable Red Grape now first offered under seal. Also Small Fruits, Trees, Etc. 3 Sample Vines mailed for 15 cents. Illustrated descriptive Price List free. **LEWIS ROESCH, FREDONIA, N. Y.**

Bless Your Souls! My brother farmers, why pay **10** or **20** cts. for a seed catalogue, when you can receive one containing **just as many and very probably more varieties** and all new vegetables that are really valuable, for just **NOTHING!** It may have less paint about the covers, but, great Scott! we are not after **paint,** but **seed,** fresh and true to name, such as will make with a master's hand its own picture all over our farms and gardens; seed I am not afraid to **WARRANT** on the cover of my catalogue. Come, my fellow farmers, and join the thousands, who for thirty years have been users of my seed; why, we were a goodly company and having pleasant times together before the great majority of the present race of seedsmen (bless the boys!) had left their nurse's arms! Send for a catalogue.

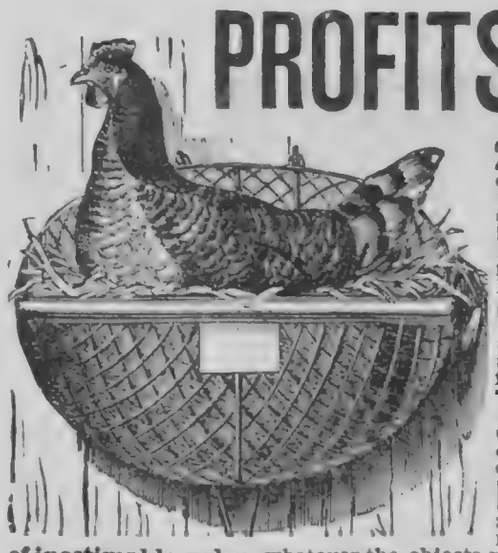
PROFITS IN POULTRY.



256 PAGES Treating on the following subjects:—Poultry Raising, General Poultry Houses, Special Purpose Poultry Houses, Poultry House Conveniences, Natural Incubation, Care of Chickens, Coops, Artificial Incubation, Preparing for Market, Caponizing, Poultry Keeping as a Business, Hints About Management, Popular Breeds, Diseases of Poultry, Parasites Upon Poultry, Raising Turkeys, Raising Geese, Raising Ducks, Ornamental Poultry, Theory and Practice.

CONTAINS 100 ILLUSTRATIONS of everything pertaining to the successful raising of poultry—equally valuable to the amateur fancier, the professional breeder or the farmer.

THOROUGHLY PRACTICAL. Embodying the experiences and practices of the most prominent and successful poultry raisers—which has at once become the **RECOGNIZED AUTHORITY.**

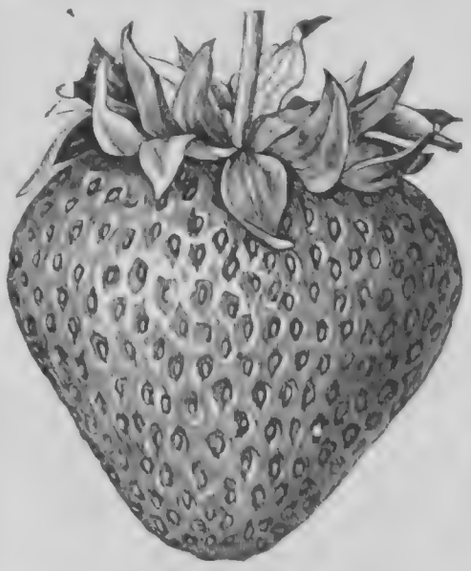
FOR ALL LOCALITIES. The teachings of the work are not of a local character, but are adapted for all localities and climates. To the novice, as well as to the most experienced poultryman, it is of inestimable value, whatever the objects may be, the production of eggs, broilers, table or market fowls. The chapter on artificial incubation alone is worth many times the price of the book to any one engaged in poultry raising as a business.

10,000 SOLD. Though published but a short time ten editions have been exhausted, and we are now printing the eleventh, so great is the popularity and demand for this elegant volume, which far surpasses any poultry work hitherto issued, both in matter and illustrations. Neatly bound in flexible cloth covers.

SENT FREE to any one forwarding 50 cents for a four months' trial subscription to the AMERICAN AGRICULTURIST, the leading Rural Magazine, the subscription of which is $1.50 a year. Try it four months and you will always want it. Five subscriptions for four months and Five Poultry Books, $2.00. Stamps taken. Address, mentioning this paper.

THE AMERICAN AGRICULTURIST, New York.

GANDY'S PRIZE OR FIRST SEASON STRAWBERRY.



This shows its shape and average size. Its color is brightest crimson, very handsome and showy and so firm as to keep several days after gathered. In quality it is luscious, the plant a strong grower with a perfect blossom, entirely exempt from disease and an abundant yielder; but its great value is in its remarkable lateness—lasting long after all others have disappeared and extending the Strawberry season to two months—and the fact that it yields a crop of its beautiful, mammoth berries the season the plants are planted. Full description, testimonials, &c., and a colored picture of it, mailed free. Plants by mail, 50 cts. a doz; $2.50 per 100. By express $15.00 per 1000.

Lovett's Guide to Horticulture, a handsome book of nearly 100 pages, finely printed and over 200 illustrations, describing every kind of hardy Fruit and Ornamental Tree and Plant, new or old, giving both defects and merits; replete with instructions on planting, pruning, culture, &c., and quoting Trees and Plants at half what they are usually sold for, will be mailed, with colored plates, for 10c., without plates free.

Headquarters for Wonderful Peach, Gandy and Monmouth Strawberries, Erie Blackberry, Abundance and Spaulding Plums, Lawson Pear, Meech's Quince, etc.—all fully described in the Guide. 200,000 Peach Trees, Apple, Pear and other fruit trees; Strawberries, Blackberries, Raspberries, Grape Vines and other Small Fruits; Evergreen and Deciduous Ornamental Trees, Plants and Vines and Nut-bearing Trees in almost unlimited numbers and great variety.

Plants by mail to all points of the Continent a specialty.

Mention this paper and a copy of *Orchard and Garden* will be sent free.

CHOICE TEXAS LANDS
Rare Chance for Settlers.

The Railroad System of Texas having developed so as to bring within easy access of good interior and seaboard markets the lands granted to the
HOUSTON & TEXAS CENT'L RY. CO.
It has been determined to offer to settlers the
Renowned Agricult'l Lands
Located along the line of the Fort Worth & Denver City R. R., beginning with Wilbarger County, comprising
200,000 ACRES
In farms of 160 acres and upward. These lands were located by the Company among the earliest, with especial care as to soil, timber and water. They are adapted to the growth of cotton, corn, oats, wheat, barley, rye, vegetables, orchards and gardens and the various domestic grasses.
Situated in the elevated and healthy region known as the Southern Panhandle of Texas, they possess a ***genial climate,*** favorable to man and beast, where outdoor work can be carried on the year round, and are in marked contrast with regions of early and late frosts or of destructive "blizzards."
Population is fast pouring in, and local government is already established, with schools, churches, &c.
TERMS OF SALE: One-fifth cash, balance in four equal yearly payments, with interest on deferred payments.
For further information as to these and lands in adjacent counties, apply to
J. S. NAPIER, Vernon, Texas,
(who is prepared to show to purchasers); or to
C. C. GIBBS, Land Ag't, Houston, Tex.

PHOTOGRAPH OF SAMPLE POTATOES RAISED BY THE LATE ALANSON PECKHAM, MIDDLETOWN, R. I. YIELD FROM ONE AND-A-HALF ACRES, 270 BUSHELS POTATOES AND 250 BUSHELS OF FRENCH TURNIPS
STOCKBRIDGE POTATO MANURE USED.

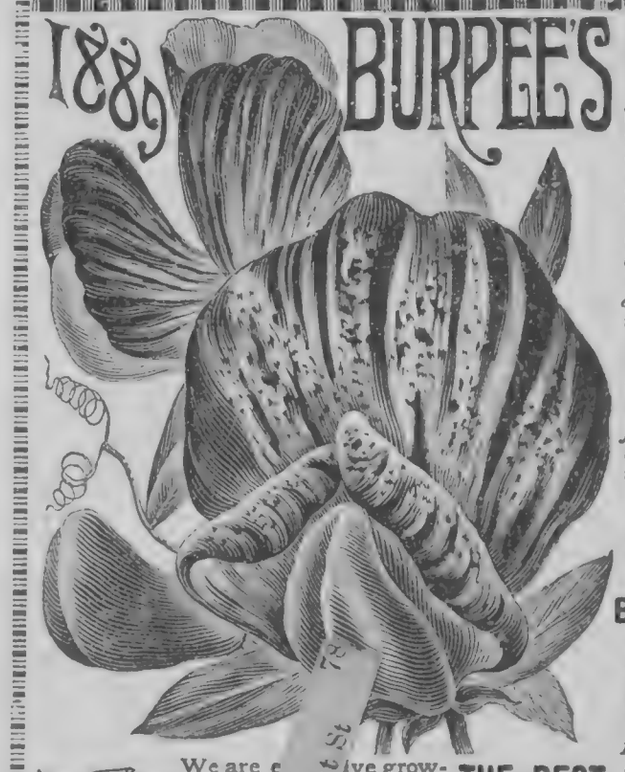
A BIG PRIZE!

The special feature in the new catalogue of the Stockbridge Special Complete Manures is the great prize of $1,100 in gold offered for the largest yield of potatoes on one measured acre. This prize is offered in connection with the American Agriculturist prize of $500 for the largest yield of potatoes, so that if the prize crop is grown on the Stockbridge Potato Manure, the grower will receive $1,100 in gold coin. This is the largest prize ever offered for this or any other crop. The Bowker Company also offer $600 in prizes of $225, $175, $125 and $75 for the second, third, fourth and fifth largest crops grown on the Stockbridge Potato Manure. What may be expected from this fertilizer is well shown in a trial made at the Rural New-Yorker grounds last year. A measured half-acre of run-out soil was planted with poor specimens of the Pride of the Valley potato, manured with 850 pounds per acre of Stockbridge Potato Fertilizer. According to the Rural's report. the measured half-acre yielded 200 bushels, or at the rate of 400 bushels per acre. It should be remembered that this was a practical test on a half acre, and the result is therefore of great value.

The catalogue is illustrated with numerous fine engravings of crops grown on these fertilizers, and the quality of the matter on the general subject of fertilizers may be inferred from the liberal quotations we have heretofore made from it.—*From the New England Homestead, February* 9, 1889.

Write for Pamphlet. Mailed Free.
BOWKER FERTILIZER CO., Boston and New York.

1889 BURPEE'S New Sweet Peas



Every one loves and admires the *Sweet Pea,* but very few are aware of the great improvements recently attained in this favorite flower. From extensive trials at our *Fordhook Farm,* and our recent visits to the leading growers in Europe,we have obtained **The Best New Sweet Peas,** including *Eckford's Finest New Hybrids* and other rare varieties of *surpassing beauty.* See *colored plate* and illustrations from nature in **Burpee's Farm Annual for 1889.** We offer *our own mixture of the choicest named varieties* at 10 cts. per pkt., 20 cts. per oz., 4 oz. for 75 cts.

ROYAL PRIZE PANSIES. *A new and original idea.*
We have carefully selected the best varieties of English, French, and German *Show Pansies, fancy, striped, spotted,* and *Giant-flowered Pansies,* of which we sell seed *of our own blending,* at 15 cts. per pkt. of 100 seeds, or 2 pkts. for 25c.

BURPEE'S FORDHOOK PHLOX.
A new strain of our own growing, pronounced by expert florists *the finest ever seen,* both in *brilliancy of colors* and *large size.* Pkt, 10 cts.

BURPEES' SUPERB NEW BALSAMS
The *largest in size, most perfect in form,* and *most beautiful in colors.* Per packet, 10 cents.

NEW FIRE-FEATHERED CELOSIA.
Strikingly handsome, with magnificent *feathery plumes* of an intense *fire color* of rare beauty.

We are e... ive grow-ers as we ...porters, of **THE BEST FLOWER SEEDS,** and in order to induce flowers to... ...r seeds a *thoro... ...al,* for **50 Cents** we will send by mail, *postpaid,* to any address, **ALL the above FIVE Beautiful New Flowers AND ... ...O one packet each** of the *New Little Gem Sweet Alyssum,—Improved Scarlet Ornamental Foli... ...et,—Striped and Blotched Petunia Hybrida,—New Large-flowering Dwarf Quaker City Mignon... ...Double Rose-flowered Portulaca,—New Dwarf Double Pulchra Marigold,—Improved Double M... ...oppy,—Giant Perfection Stocks,—New Miniature Sunflower* and *Extra Fine Mixed Verbena.* ...tion and directions for culture p... ...n each packet. At regular prices the **FIFTEEN PACKETS**—all the Choice Flower Seeds named in this advertisement—would cost $1.60, b... will mail the entire **DIAMOND COLLECTION** for **50 Cents**—*only one-third their retail value,* or **FIVE Complete COLLECTIONS for $2.00.** Try to get up a Club of Five. *Postage stamps accepted same as cash.* If you do not want all the Seeds, give some to a friend, as separately four or five varieties would cost as much as the entire assortment. **ORDER NOW,** and if you have not already received it, write also for **BURPEE'S FARM ANNUAL** for **1889.** A handsome book of 168 pages, with hundreds of illustrations and beautiful *colored plates, painted from nature.* It tells all about the **BEST SEEDS, Bulbs, Plants,** &c., including **Rare Novelties** that cannot be obtained elsewhere. Entirely free from sensational and exaggerated descriptions, is a *trustworthy Guide,* of great value to every one who cultivates a garden in town or country.

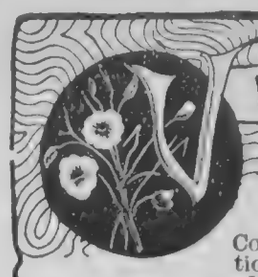
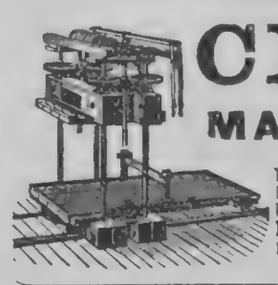
VICK'S FLORAL GUIDE



The Pioneer Seed Catalogue of America.
1889.
Complete list of Vegetables, Flowers, Bulbs and Small Fruits, with descriptions and prices. **New Shape, New Type, completely revised and improved.** Contains more varieties than any other Catalogue printed. *Three Elegant Colored Plates,* 8x10½ inches, and a frontispiece. Every person who owns a foot of land or cultivates a plant should have a copy. Price of VICK'S FLORAL GUIDE, containing a certificate good for 15 cents worth of Seeds, only 15 cents. **JAMES VICK SEEDSMAN Rochester, N. Y.**

SCAB

H. C. & J. C. GROOME, of Locust Hill Stud Farm, Wythe county, Va., say of THYMO-CRESOL (The Cold-Water Dip): "*It has been with us notably successful in curing Scab in Sheep, in an advanced stage. We have found the growth of the wool materially promoted by dipping Sheep in it early in autumn. It destroys Lice on Colts, is a most useful dressing for the Hoofs of Horses, and a valuable remedy in cases of Grease and Thrush. We have found it a speedy cure for Mange, and as a Disinfectant and Purifier its merits cannot be too highly commended. In fact, the limits of its usefulness to the stock-breeder are difficult to realize, and here we should be inclined to feel quite helpless without it.*" Imported only by **T. W. LAWFORD & CO., Baltimore, Md.** Sample by mail for 50c.



CIDER MACHINERY.

RURALISMS

A VIEW IN THE RURAL GROUNDS.

THE present illustration is engraved from an imperfect photograph. Still it shows quite well what it is designed to show, viz., the mingling and grouping of deciduous and evergreen trees in a pleasing and effective way so as, at the same time, to conceal boundary lines. Grounds, even though very limited, may be so planted as to give a different view from almost every change of position. This is strikingly exemplified by photographic views. The Rural Grounds (proper) are but a trifle over two acres in extent, and yet there is such a variety of trees, shrubs, arbors, walks and lawns, so many little hills and valleys, that scores of different views might be taken, no two of which would be recognized by the stranger as a part of each other. This is a point well worth studying by those who are arranging new grounds or who intend to do so. Few, without experience, are aware to what an extent a small place may be made to present an ever-interesting, ever-changing appearance, by a judicious arrangement of plants wisely selected. The small evergreen tree in the middle of the picture is a Small-leaved Hemlock (microphylla). Behind it is Nordmann's Fir, back of which is a Pyramidal oak (Quercus rober fastigiata) and various shrubs. On the left of the path are a Golden retinispora, a Weeping Norway spruce, a Maiden-hair tree (Salisburia adiantifolia) roses, lilacs, etc. On the extreme right is a White Pine which has been cut back for several years and which is now as thickly clothed with foliage as a Common Hemlock. The lawn in the foreground slopes gently to the east.

The photograph was taken in early spring.

Farm Economy.

TWO DESIGNS FOR THREE-HORSE POLES.

(*See page* 158.)

A NEW YORK METHOD.

THE sight of the device shown at Fig. 8 on page 35, of the RURAL, induces me to give an illustration of the three-horse thills, whiffletrees and neck-yokes that I have used for several years with much satisfaction. Each horse has to do his share of the work, and no shirking is permitted, as is very often the case when the draft is stationary.

In the drawing—see Fig. 55—A A represent the thills; B B B are three single whiffletrees; C is a two-horse evener or whiffletree; D is a three-horse evener or whiffletree; E is a 2½-inch plank made to fit the hounds to a wagon and halved and fitted on top of the cross-pieces and bolted with four half-inch bolts; F F are neck-yokes. G G are turning bolts. The whiffletrees to be used for any purpose without the thills are the same as those on the thills, only the three-horse evener has a clevis for chain, plow, harrow, etc. B. M. G.

A MICHIGAN DEVICE.

In a recent RURAL I saw a three-horse pole which I think is very crude, as it is rigged; for while one horse may be doing all it can, the other two may be doing almost nothing. I send a sketch of my three-horse rig, with which I have been hauling some very heavy loads. (It is shown at Fig. 54). With it I consider three horses abreast equal to four, two on the pole and two to lead. The wagon I use is a heavy farm truck with four-inch tires, rigged for two horses. I took out the pole, made a stub, A, to fit in the hounds, B; then I made a pair of straight thills 12 feet 10 inches full length, 2 feet 10 inches over all at the cross-bar, and clipped them to the axle-tree at C C. I have a set of Gale equalizers, but they are too light for heavy work, so I made a heavy set that would stand heavy work. I think that as a three-horse rig this device has no equal. Every horse has to do his share. The neck-yoke is five feet four inches long, has rings fitted to each thill, and a ring at each end and two in the center three inches apart to let the pole strap draw in the center; the hold-back irons should be set 10 inches from the end so that if one horse backs up and the other goes ahead, he cannot throw the neck-yoke off the thills. Three good 1,200-pound horses on a fair road will haul five tons without any trouble with this arrangement. L. L. DAVISON.

Grand Blanc, Mich.

A MASSACHUSETTS HOG TROUGH.

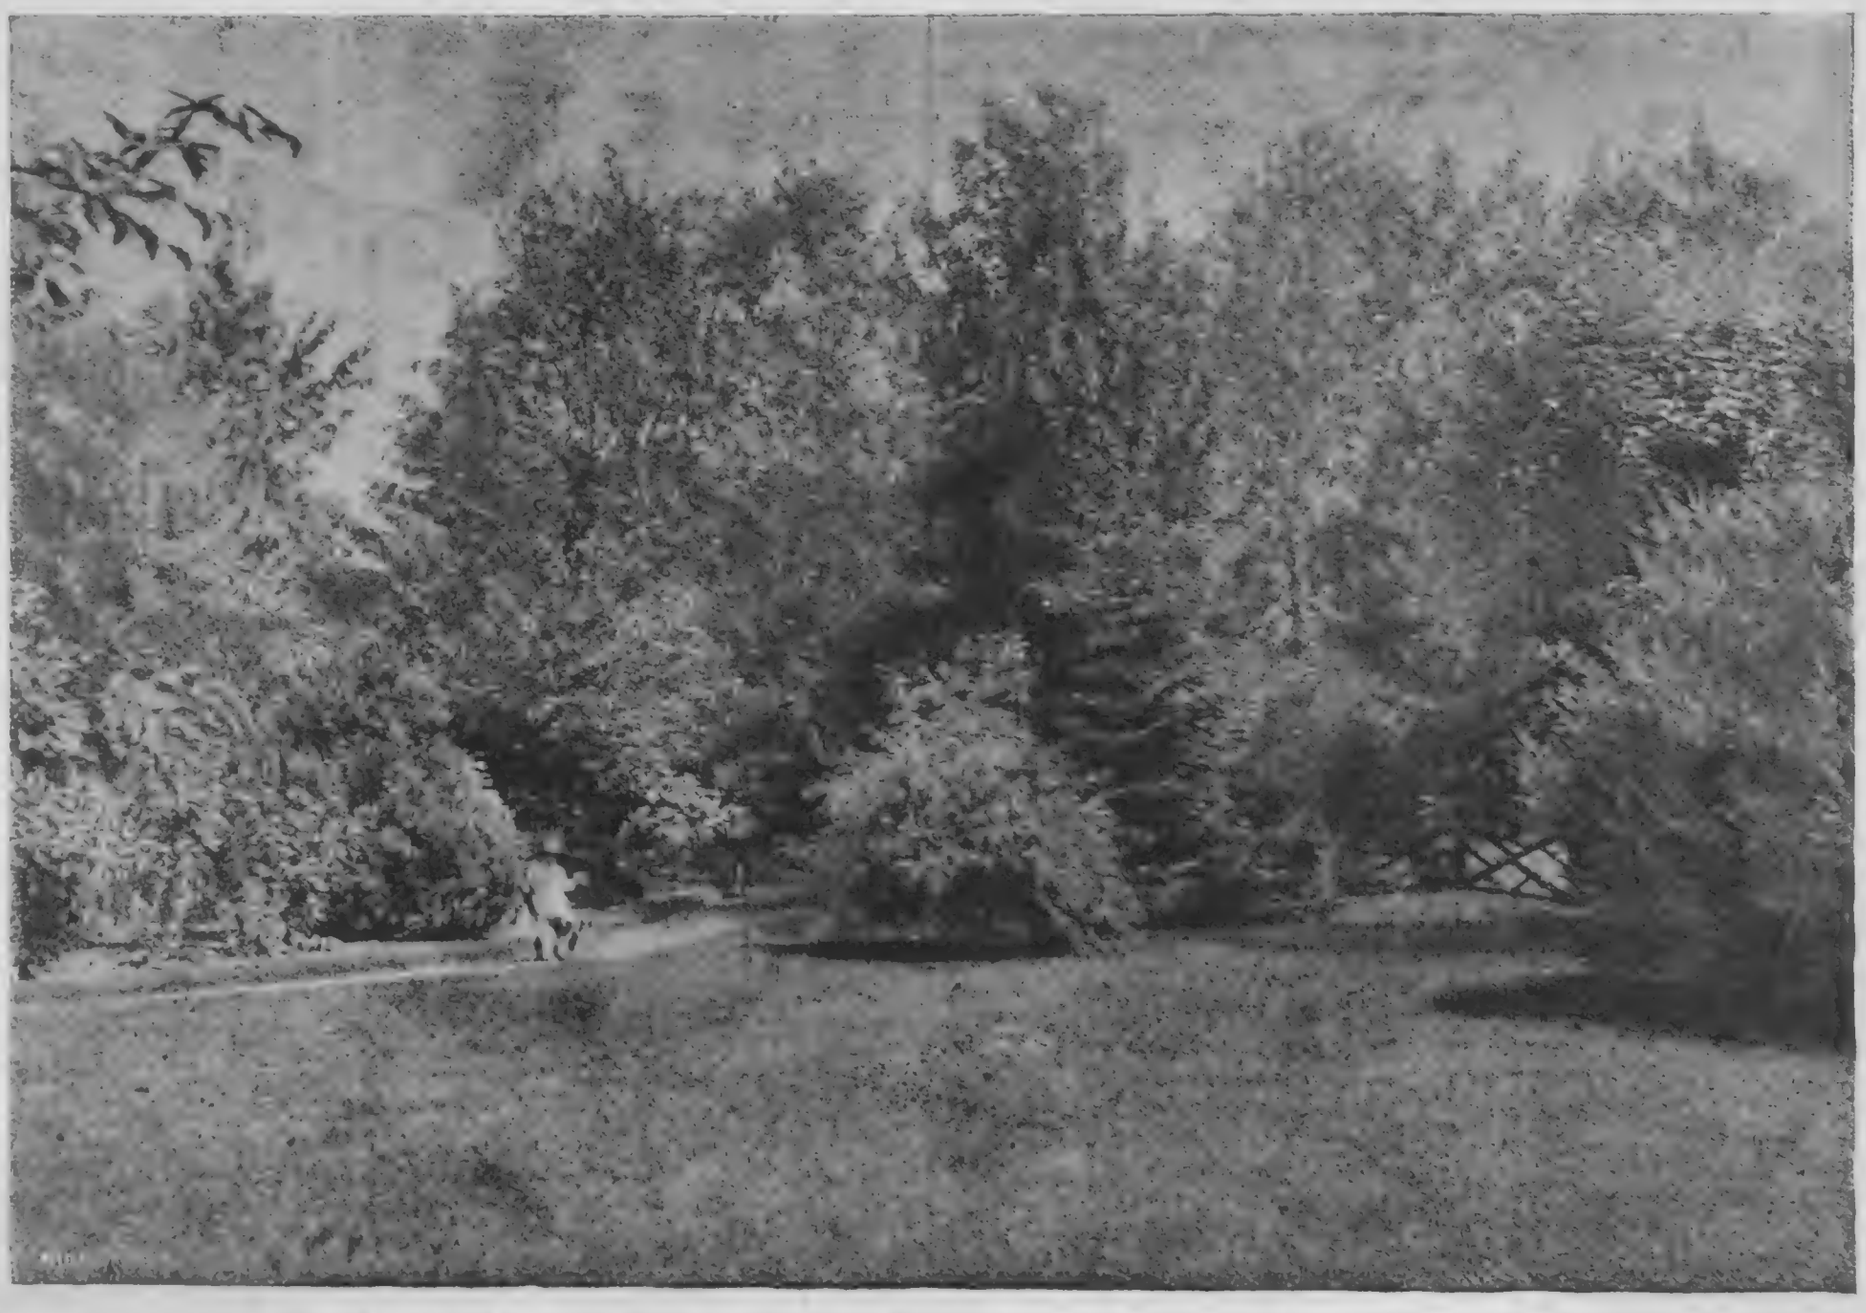
At Fig. 56 is shown an excellent hog trough with a swinging cover, which has the following advantages over those ordinarily used: 1. It is so placed in the partition that a hog cannot get into it or even place his feet in it with any comfort whatever; hence it is always much cleaner than a trough which is wholly inside the pen. 2. It affords great ease and convenience in feeding or in cleaning it from refuse feed or accidental filth, the swinging cover shutting away the hogs while the trough is being cleaned from the outside, and, moreover, feed can be placed safely in it without spilling it on anxious heads or noses. 3. Whether the cover be swung out or in, the trough may be as tight as the partition itself, and no current of air can blow upon the animals should the trough open from the outside of a building. It is very simple, and readily constructed. Make a common V-shaped trough out of two-inch planks one foot wide, letting the end pieces extend an inch or more higher than the sides, to give a place for holes for the bolts which serve as hinges of the cover. Make the latter out of the same plank and just the length of the inside measure of the trough, with two triangular pieces firmly nailed, one at each end, with holes bored to correspond with holes in the ends of the trough. Fasten the cover to the trough with suitable bolts; set the trough lengthwise of, and directly under the opening in the partition cut to receive it. Nail it there firmly, and with a button to hold the cover back while the hogs are feeding, the article is finished. A. A. R.

Mt. Hermon, Mass.

CORN-DRILL.

(*See page* 158.)

At Fig. 57 is shown a two-horse corn-drill used in the West for planting sod. It is not



PHOTOGRAPHIC VIEWS IN THE RURAL GROUNDS, CONTINUED. Fig. 53.

patented, is simple in construction and gives perfect satisfaction. Good oak wood should be used in its construction. The dimensions may be varied to suit one's fancy, but are usually about as follows: Plank, forming the main body, five feet long, one foot wide and two inches thick; cross-bar in front 3½ feet long, three inches wide and three inches thick; diameter of wheel 12 inches; extreme length of shoe 18 inches. The shoe is made and attached like that of the ordinary two-horse corn-drill. The wheel should be 1½ inch thick, and encircled with a good, heavy tire. The long iron slide, extending through the box and connected with the propelling arms of the wheel, as shown in the cut, slides back and forth directly on top of the plank, and is provided with a suitable sized hole to hold two or three grains of corn, which are drawn back under a thick piece of leather (nailed across the bottom of the box), and dropped down through the shoe. The stirrups at either end of the cross-bar should be made of iron or steel, and should be not less than two inches wide and a quarter of an inch thick.

Rexford, Kansas. E. K. M.

Horseman.

THE THOROUGHBRED STALLION, Q. C.

WHILE the Trotter successfully competes in popularity with the Thoroughbred in this country, the latter still holds, unchallenged, the first place among horse flesh in the British Isles. Every animal of any particular merit is widely known; his characteristics, history and pedigree are retailed repeatedly in the papers, and his likeness finds a prominent place in the illustrated journals. At present a prominent favorite is the Thoroughbred stallion Q. C. (Queen's Counsel) the property of Mr. William Edwin Litt, of Shropshire. He was foaled in 1883, and was got by Wisdom out of Brenta. He was exhibited at the Nottingham show of Thoroughbreds last year, and was awarded one of the Queen's premiums of $1,000. His likeness here has been re-engraved from the London Live Stock Journal.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.

HOW TO MAKE BUTTER "COME."

V. A. S., Benton Harbor, Mich.—My three cows have been giving milk since last July or August. Their feed consists of corn-meal and oat-meal once a day, and straw, corn-stalks and marsh hay alternately, with salt nearly every day, and plenty of clean spring water at all times. The milk is kept in a pantry off the kitchen where it is too cool to sour and too warm to freeze. It is scalded. and we churn twice a week, with the cream at a temperature of 60 degrees. We churn with a dasher and stone churn all day, but the butter doesn't "come." Why doesn't it "come", and how can we make it do so?

ANSWERED BY HENRY STEWART.

There are two reasons why butter will not come: one is because the cream is too cool and sweet; another is because the cream is too warm and sour. In the first case the cream becomes granular as if it were filled with sand, and it dashes about without foaming. In the second case, the cream gets very thick, foams and swells and soon becomes very strong and sour-smelling. In the first case, the remedy is to keep the cream in a warm place until it becomes distinctly sour, and then to churn it at 65 degrees. When the cream goes at 60 degrees into a cold churn and is churned in a cold room, it can easily fall to 50 degrees, when the small particles of butter are too hard to adhere and they dash about in the butter-milk without gathering. If a quart of water at 80 or 90 degrees is thrown into the churn the butter comes very soon, as it is already well separated. When the cream is too sour and warm and foams in churning, a quart or two of cold water will remove the difficulty and bring the butter; but under these circumstances the butter will not be good.

ANALYSES AND COST OF FEEDS FOR MILCH COWS.

D. D. B., Ringtown, Pa.—1. What is an analysis of rye chop? 2. Do equal parts of rye chop, wheat-bran and corn-meal make a good food for milch cows? 3. Is bran at $20 per ton equal as feed to wheat middlings at the same price?

ANS.—Rye chop and the other materials mentioned contain the following nutritive elements by which their feeding values may be compared·

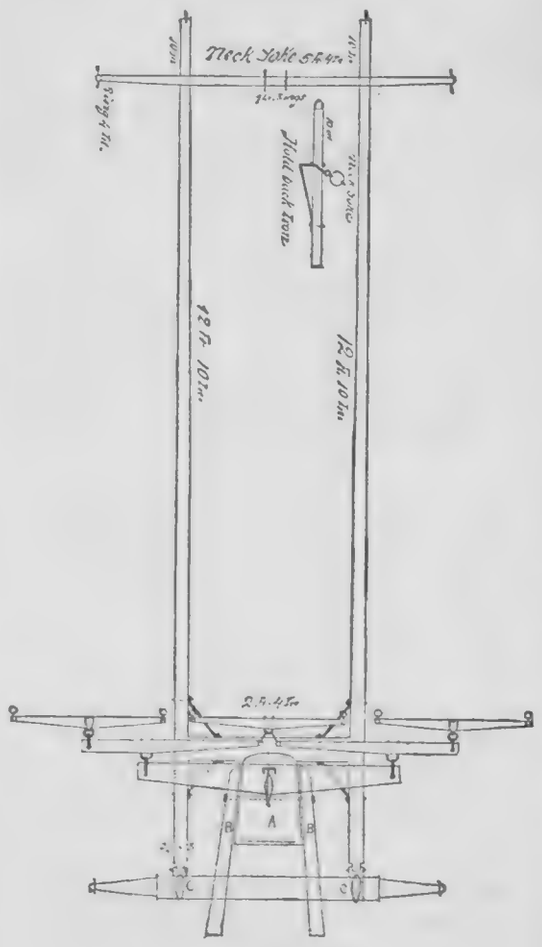

Fig. 54.

	Nitrogenous matter.	Carbohydrates.	Fat.	Feeding value.
Rye chop per cent..	11.0	67.4	2.0	$1.08
Wheat-bran	12.9	59.1	3.5	1.01
Corn-meal....	10.0	62.1	6.5	1.11
Wheat middlings...	11.4	66.8	2.9	1.00
Cotton-seed meal...	41.5	24.4	13.0	2.30

As a matter of practice, corn-meal and wheat-bran, mixed in equal parts, make an excellent—perhaps unexcelled—food for cows kept for milk or butter. If anything at all might be added to improve it, it would be one-fourth as much cotton-seed meal, which would largely increase the nitrogen and the fat. Wheat middlings tend to make a white and crumbly butter, although for milk alone they are very good feed, if the price is right. By consulting the feeding values given and the market prices, one may be guided in choosing the most economical foods. It is seen that cotton-seed meal is a very cheap food at $25 per ton, but on account of its extremely rich and concentrated character it cannot be fed safely in any but very small quantities.

PEAS FOR A HOG PASTURE.

C. W. E. B., Fowlerville, Pa.—How much peas should be sown per acre for a hog pasture? Would this be a good plan? Where can the peas be obtained for seed?

ANS.—Peas make very good pasture for hogs, but it would be better to sow oats with them, by which means the vines are held up from the ground and the yield of the crops is nearly double, both crops yielding almost as much as if sown alone. Pasturing swine in this way is a wasteful practice unless it is done for the improvement of the soil, as the herbage is trodden down into the ground in great part. As the crop cannot well be pastured until the growth is quite large, it would be far better to cut the fodder and feed it to hogs on a part of the land and then turn them in to consume the second growth. Clover is the very best pasture crop for swine. Any seedsman who advertises in the RURAL can supply peas for seed.

AILING CHICKS.

J. C. F., Minneapolis, Minn.—My chickens hold their heads on one side as if something were in their ears. After doing this for a few days, they become worse, until they turn necks and heads clear around four or five times. Then they fall down and each neck and head seems to have a fit. After the first attack they seldom live over a week.

ANS.—This is a trouble that often occurs, especially among Plymouth Rocks, the cause of which is not conclusively determined; but it seems to occur when chicks are from eggs laid by over-fat hens. The large lice also cause the trouble, as well as dampness or exposure to cold drafts. Sulphur in the food, or over-heating of the eggs during incubation, has also been assigned as a cause, the latter being probably nearer the solution than anything else.

COW-PEA HAY.

M. F. A., Chelsea, Ky.—As to pea hay, how much seed per acre should be sown? When should the "hay" be cut? Where can I obtain seed and at what price?

ANSWERED BY HUGH L. WYSOR.

Hay made from cow-pea vines requires a longer time and is more difficult to cure than that made from other forage crops. The quantity of peas necessary to sow an acre would depend very much upon the variety used, some kinds growing only in bunches and others making vines 12 to 25 feet in length. The Conch pea, which is the variety usually sown in the South for forage crops, will cover the ground if planted two or three in a hill six feet apart. Sown broadcast, a peck to the acre would be sufficient. It does not mature seed in middle Georgia. Plant the seed from May 15 to June. Cut in favorable weather when the the vines have matted over the ground. For prices and decription of varieties, write to the Alexander Drug and Seed Co., Augusta, Ga.

THE GAERTNER GRAPE.

J. B., West Park, N. Y.—Has the RURAL grown and fruited a grape called the Gaertner—(Rogers No. 14)? If so, can it recommend it for general cultivation? It is very handsome and of fine quality. What I want to know is as to its healthfulness and productiveness?

ANS.—The Gaertner (Rogers's No. 14) has never done well at the Rural Grounds. But in some places it is a magnificent grape, bearing large bunches, large berries of a light-red color and translucent. It is also of very good quality, the pulp being tender, pleasant and rich. The vine grows vigorously and it is in many places very productive.

ABOUT ROSES.

B. A. B., Afton, N. Y.—1. How are Perpetual roses propagated? 2. What is the best way of protecting a tender rose bush in winter? I built a small house around mine and covered it with glass, and the bush is now quite green. Was that a good way? 3. What is the difference between Hybrid Perpetual and Monthly roses? 4. What are the names of one or two of each kind that would do well here?

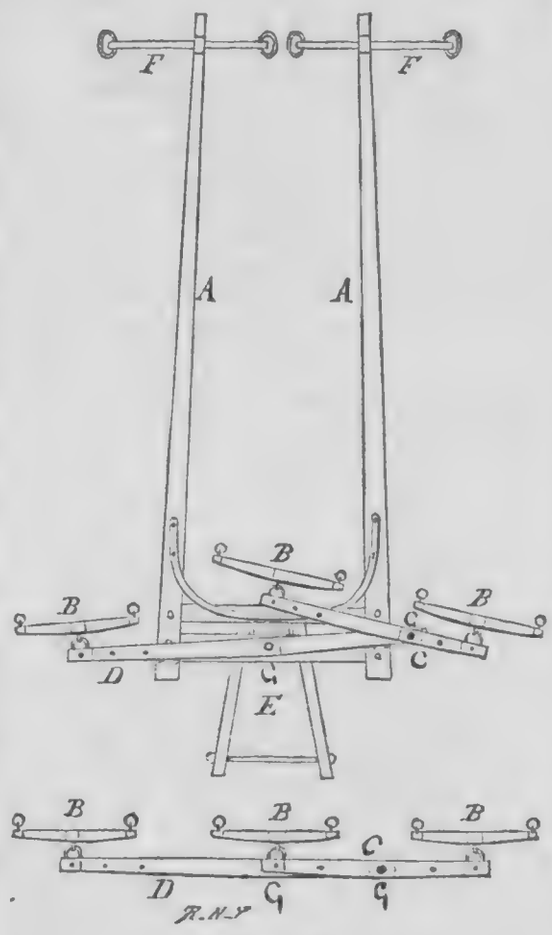

Fig. 55.

ANS.—1. By budding and by cuttings. 2. They may be taken up and wintered in pits or cold-frames, or in the cellar. They may also be protected by glass houses as our inquirer has done. They may also be wintered in trenches. Some are successful in keeping tender roses through the winter by heaping soil around the bushes and covering them with long manure, leaves, etc. The R. N.-Y. has not been successful by this method. 3 The Hybrid Perpetuals or Remontants were originally crosses between Bourbons, Hybrid Chinas and Damask Perpetuals. Then followed crosses innumerable of Bengals, Teas, etc., upon them. Recrossing was continued until this class of roses is mixed up beyond the possibility of being straightened out. They are, for the most part, hardy without protection in any climate similar to that of New York. The Monthlies are the real perpetual bloomers, but few of them will stand a zero temperature. The Teas belong to this class. For Monthlies: Bon Silene, Catherine Mermet, The Bride, Isabella Sprunt, Perle, La France. Hybrid Perpetuals: Alfred Colomb, Gen. Jacqueminot, Mabel Morrison, Charles Lefebvre.

STOCKED OR SWOLLEN LEGS IN A BROOD-MARE, ETC.

G. C. L., Lawton, Mich.—1. What should be done for a mare with foal, troubled with a swollen hind leg? 2. Another mare with foal has rubbed the root of her tail till she has worn through the skin. How should she be treated? 3. What is the best work on horses, especially for the treatment of brood mares?

ANS.—1. The condition is not uncommon in mares with foal. Very little medicinal treatment is necessary, as the swellings will usual-

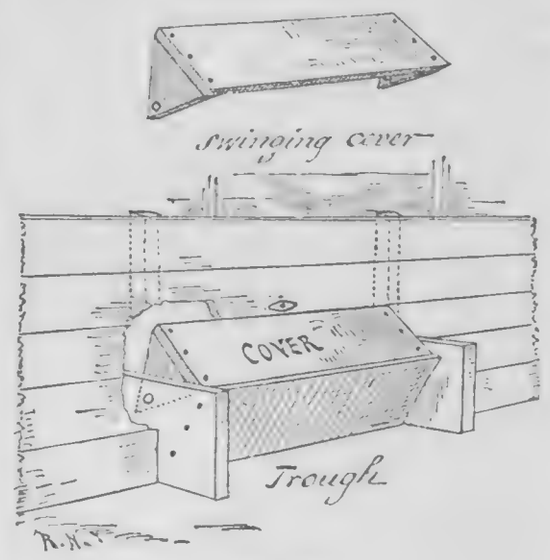

Fig. 56.

ly disappear after foaling. Where this tendency to stocking of the limbs occurs, special attention should be given to the care and diet of the mares. They should have moderate daily exercise when the weather is suitable. Light work is best, but the run of a yard will do fairly well. Do not feed too heavily, especially with corn or other heating foods, as over-feeding favors the stocking. A restricted, laxative diet, to consist in part of roots or mashes, is the most suitable for such cases. If the swellings become very bad, give three drams of the best aloes every other night until the bowels are loosened. Then give one table-spoonful of the following powders in the feed once or twice daily: nitrate of potash eight ounces; iodide of potash four ounces. Bathe the swollen limbs occasionally with diluted compound tincture of iodine, or spirits of camphor. It is best not to use the internal remedies unless it becomes necessary, especially during the latter part of gestation, because of the tendency (usually slight, however) to produce abortion if the bowels or kidneys are unduly excited. 2. For the present we would advise some such simple treatment as thoroughly washing out the tail with warm Castile soap-suds and then sponging over with coal oil or kerosene. If the skin is much abraded, apply zinc ointment. If the trouble continues after foaling give a course of treatment for intestinal worms. See Intestinal Worms in a Horse in the Farmers' Club, of May 12, 1888. 3. "Horse-Breeding" by J. H. Sanders, to be had of the J. H. Sanders Publishing Company, Chicago, Ill., price $2 00.

CHRONIC BLOATING IN A COW.

F. D., Southampton, N. Y.—During the past month the body of a medium-sized cow of mine has swollen so much that it fills a stable door three feet wide as she passes through. She is expected to come in about April 20. She eats and drinks as usual. A neighbor says one side appears to be filled with water, and the other with air just under the skin. She is very much bloated. What should be done for her?

ANSWERED BY DR. F. L. KILBORNE.

Give the cow one-half pound each of Epsom salts, and common salt with one ounce of ginger as a drench in a quart of water. This dose should move the bowels freely. If it does

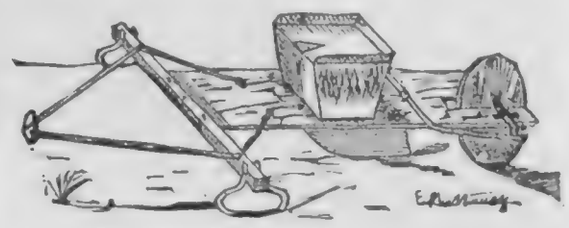

Fig. 57.

not, repeat it in 24 hours. Then give three table-spoonfuls of the following powders in the feed night and morning, or as a drench if she refuses her feed—sulphate of soda and powdered gentian root each one pound, niter and carbonate of soda each one-half pound, nux vomica one-fourth pound, mix—continue until relieved. If the bloating becomes very

bad, give half-ounce doses of carbonate of ammonia in one-half pint of cold water every three hours until relieved. If the breathing becomes difficult and there is danger of suffocation, the paunch must be punctured through the abdominal wall on the left side, at a point equally distant from the point of the hip and the last rib, where the swelling is most prominent and the skin very tense. The best instrument for this purpose is the trocar and canula. But in the absence of this, a pocket-knife with a narrow, two-inch blade, may be used. Plunge the blade in the full length and hold it in the opening until a long quill can be introduced to allow the escape of the gas. This should be held in position until the gas ceases to escape. There is very little danger in this operation, and almost any one can safely perform it. The diet should be light for at least two or three weeks. Roots or scalded bran once or twice daily will be excellent.

HOW MUCH SEED POTATOES.

J. V. C., Lysanaer, N. Y.—In planting potatoes for flat culture, how many bushels of seed are needed per acre? I never took such interest in farming as I have taken since I began to read the RURAL.

ANS.—The question in the above can not be answered. All depends upon the size of the potato, the number of eyes to be planted, the number of eyes in the variety of potato and the distance apart. The best way to find out is to count the potatoes in a barrel, and multiply the number by the number of pieces each potato will give. Then estimate the distance apart at which it is proposed to plant. If to be planted one by three feet apart, 14,520 pieces will be required for an acre.

HOW TO GET THE LARGEST POSSIBLE YIELD FROM ONE POTATO.

C. F. P., Brenner, Kan.—How can I get the most out of my sample of the R. N.-Y. No. 2. potato? Would it be advisable to plant in a hot-bed and transplant, or should I cut the tuber in pieces with, say, two eyes to a piece? I am anxious to get the best results possible.

ANS.—The best (largest) quantity can be obtained by sprouting the potatoes in a hot-bed and planting the sprouts until the tubers are exhausted.

THE RURAL TRENCH SYSTEM OF POTATO PLANTING.

J. W, Oglethorpe Club, (no address).—1. Could the RURAL's method of planting potatoes be profitably used on about 10 acres? 2 What potato fertilizer did the RURAL use in its late "potato contest?" How much ammonia, potash, and phosphoric acid did it contain? 3. What is the RURAL's theory as to putting half the fertilizer in the trench, mixing it with the soil, then planting the seed-pieces and putting the other half of the fertilizer above the "seed," instead of putting the whole amount in the bottom of the trench and mixing it with the soil? 4. What is the best tool with which to open the trenches 15 inches wide? 5. How should barn-yard manure be applied?

ANS.—1. Yes. 2. We use a fertilizer which is guaranteed to analyze 3½ per cent. of nitrogen, 12 per cent. of phosphoric acid and six per cent. of potash—the potash being in the form of a sulphate, the phosphoric acid in bone (not rock) and the nitrogen from blood, sulphate of ammonia and nitrate of soda. 3. It was done in the way of an experiment. If we were raising potatoes as a regular farm crop, we would apply *all* the fertilizer broadcast and harrow it in *before* plowing the trenches. 4. A shovel plow, costing about six dollars. Any plow can be used by throwing a furrow both ways thus forming a trench. 5. If the land is level we should apply it in the fall and plow it under. Then plow again in the spring, returning the manure to the surface in great part.

INFLAMMATION IN A HORSE'S EYE—"HOOKS."

L. E. D., Annapolis Junction, Md.—Over the right eye of my young horse a skin has been growing for some months. It started at the inner corner and it isn't attached to the ball, but slips over it; it sometimes covers the sight. A neighboring horse doctor, after examination, pronounced the trouble hooks, and cut a portion of the skin off. Since then it has grown very fast, and now it is nearly as large as it was before it was cut. What is the malady and what causes it? What should be the treatment?

ANSWERED BY DR. F. L. KILBORNE.

There is probably chronic inflammation of the eye, the result of some injury or disease, the nature of which we are unable to give from your description. The skin you mention as growing over the right eye, and which your "doctor" pronounced "hooks," is a natural, membranous rptection or covering for the eye, which is always present in the horse, and can be seen in the inner angle of the eye at any time. This natural protector of the sensitive surface of the eye is the *Membrana nictitans*, commonly called the "third eyelid" "winking eyelid," or "haw." The use of this membrane is to extend or protrude over the eye for the purpose of removing dust and any foreign bodies that chance to pass the eyelids proper. It probably also serves to moisten and keep the surface in a healthy condition. Inflammation in the eye and a few diseases may cause this haw to be temporarily protruded, as in the present case. The proper course of treatment is to reduce the inflammation, when the haw will usually return to its natural position. The person you employed to treat your horse should be designated by his proper title "quack," since it is only ignorant quacks that still follow the old barbarous practice of cutting out the haw or "hooks." Besides being painful, and destroying one of the natural protectors of the eye, the operation is very often injurious, and rarely if ever followed by any good results, as practiced by such operators. Without knowing the cause of the trouble, we can only give general treatment which may or may not be successful in this particular case. Give the horse five drams of Barbadoes aloes to open the bowels. Then cover the eye with a light bandage and keep it wet with a solution of 30 grains of sugar-of-lead and 10 grains of morphia, in one pint of water—the solution to be milk-warm when used. Watch the eye closely and report results and condition in two or three weeks.

RATIONS FOR MILCH COWS.

T. G., Sharon, N. Y.—What is a well balanced ration for milch cows, composed of the following grains, with Timothy as fodder—oats and peas; oats and rye; oats, peas and rye? What alterations should be made for feeding young animals to the best advantage?

THOROUGHBRED STALLION Q. C. Fig. 53.

Re-Engraved from the London Live Stock Journal.

ANSWERED BY HENRY STEWART.

The standard ratios of nutrients, while they have a general application to feeding cattle, horses and other domestic animals, cannot be applied with any certainty to the production of milk. In regard to this there is something to consider beyond the mere supply of a certain quantity and kind of nutritive elements. Digestion, assimilation, and the effect of the food upon certain organs must all be considered, and in the feeding of cows these come before the mere nutritive elements of the food. In feeding for milk we undoubtedly require a large portion of fat and nitrogen, with a less proportion of such carbonaceous matters as starch. Thus the composition of the dry matter of 100 pounds of the best milk may be taken, on an average, as four pounds of caseine, four pounds of butter, four pounds of sugar and three-quarters of a pound of various mineral matters. In these substances we have about four ounces of nitrogen only in the 100 pounds of milk against eight pounds of carbon and water. Hence, for the purpose of procuring a large quantity of rich milk, one might suppose it necessary only to feed a large amount of fat in the food and so gain the largest product of butter. This, however, will not do in practice, for the animal cannot healthfully dispose of the food thus selected, because the digestive organs cannot prepare it and the blood which receives and distributes to the various organs the aliment assimilated, would be overloaded with the excess and the animal would become diseased. Consequently, in considering the composition of foods, we must take into account not alone the nutritive elements of the foods, but also their effect upon the digestive organs, and, most especially, their effect upon the quality of the butter. The first consideration is chemical in its relation to the question; the others are physiological, and cannot be considered from a chemist's point of view. For this reason we sometimes fail to realize our expectations in feeding cows for milk, and especially for butter. It is a well known fact in physiology that the fats of food are emulsified in the process of digestion by intimate mixture with the pancreatic fluid, and are absorbed by the intestines and pass directly into the blood. As they are not subject to change in the blood, they must pass at once into the tissues and the milk glands, and thus affect the character of the butter of cows and the fat of animals fed for meat. It is thus that the fat of pork is made soft when the pigs are fed on beech nuts, of which the oil is very limpid and fluid; while it is harder when the pigs are fed on peas than when they are fed upon corn. The very same thing applies to butter, and explains why some foods make white and soft butter, while others make yellow, firm, and well flavored butter. In my very careful and long-continued experiments I have found that foods affect the butter in the manner following:

Buckwheat bran: white, crumbly butter.
Linseed oil-meal: soft, oily, flat-flavored.
Bran and middlings, both wheat and rye: light, rather soft.
Corn-meal: firm, yellow, high-flavored.
Cotton-seed meal: hard, rich-flavored and yellow.
Oats: light, crumbly, poor-flavored.
Peas; yellow, rich, soft.

For quantity of milk, brewers' grains, malt-sprouts, corn-meal and bran, buckwheat-bran, wheat or rye-bran or middlings, corn or rye-meal stand in the order mentioned. Now, to come to the point of the inquiry as to the result of feeding the substances named, it would appear that oats and peas mixed would be the best food that could be selected; and to reach the desired ration we might take 400 pounds of oats and 100 pounds of peas and grind them together and get this nutritive ratio.

Oats alone	1 to 6.1
Peas alone	1 to 2.9
4 of oats to 1 of peas	1 to 6.

The mixture gives almost exactly the same ratio as oats alone, but as the effect of oats upon the butter is not desirable, the mixture of the peas is an improvement in this respect while it keeps the ratio in a healthful proportion. As a rule, whatever foods are best for the product of milk are best for feeding young animals which require precisely the same elements of nutrition as are found in the best milk.

KAFFIR CORN AND "MILLO MAIZE."

Subscriber (address mislaid.)—What does the RURAL know about the culture and benefits of Kaffir corn and Millo Maize for forage, the after-growth serving for fall pasture? Farmers who have tried both in this State highly commend them.

ANS.—The R.N.-Y. can speak of Kaffir corn only from its own trial. It grew to the hight of about five feet—one stalk, Some of the stalks were cut back and the second growth did not amount to much. The leaves are broad, like those of corn, and the stalk is close-jointed. It matured seed easily. The only advantage of this kind of sorghum over corn is a greater drought-resisting capacity. Otherwise corn is greatly to be preferred. Its culture is just like that of corn. Milo or Millo Maize is another absurdly-named sorghum. Its legitimate name is the Rural New-Yorker Branching Sorghum since it was first introduced to the trade under that name. It is a luxuriant variety of sorghum, that, when cut back, will not only continue to grow as fast as ever, but will send up two or three shoots for every stalk cut back. It is a grand fodder plant. It will not mature seeds in the North, and fails even in South Carolina during unfavorable seasons. To call these two sorghums by the names of Millo Maize and Kaffir corn is altogether absurd and misleading.

GOLDEN QUEEN RASPBERRY, ETC.

W. A. D., Winnipeg.—The nurserymen all claim that the Golden Queen raspberry is of unexcelled beauty and firmness; but in a late RURAL the statement was made that it isn't good for market. I was thinking of planting two acres of it on my farm in the province of Ontario for a market 100 miles away; would it be advisable to do so? 2. Will the Parry strawberry do well on light land; and will it bear shipment to a distant market. 3 Do unleached wood ashes and ground bone furnish everything needed by strawberries and raspberries? About 100 loads of leached wood ashes have been lying for many years within two miles from my farm; are they worth carting?

ANS. 1. The R. N.-Y. would not advise its friend to plant two acres of Golden Queen raspberry. Yellow is not a favorite color in the market and this berry is too soft—softer, decidedly, than the Cuthbert of which it is a sport. 2. The Parry strawberry is of good quality and fairly—only fairly—productive. It is firm enough for market. It needs rich soil and probably one that inclines rather to clay than to sand. 3. Yes they do. The leached ashes will give you lime and a little phosphoric acid—that is all.

TREATMENT OF AN OLD NEGLECTED ORCHARD.

C. F. A., Darien, Conn.—What is the best thing to do with a 20-year old apple orchard that has probably never been pruned or cultivated since it was set out? Some trees have made a fair growth; but most of them are not over eight to 10 feet high, and not more than 12 feet in spread of tops. Would it pay to try to bring the trees into bearing; or would it be better to set out new ones?

ANS.—Much depends upon the healthfulness or lack of it in the trees. If in spring it is found that they are loose at the base and have an extremely stunted appearance, it would be well to remove them. On the other hand, if they stand firmly and have not been attacked by the *apple-borer* and if they are free from the scale insect and other pests and maladies, being fairly healthy, cultivation may be judiciously given, and pruning the trees may yet yield good results. But the orchard will never be what it might have been with good culture and pruning from the first. If four-fifths to nine-tenths of the trees are condemned, it would be as well to clean out the whole, and, selecting some choice trees, start on new ground, pruning the trees and cultivating the orchard well from the beginning.

BRAZILIAN FLOUR CORN.

A. F., Williamsburg, Ind.—1. How are flowers and other plants hybridized? 2. Is the Brazilian flour corn superior to common field corn?

ANS.—1. We are constrained to refer our friend to back numbers of the R. N.-Y. for explicit directions. In brief, remove the anthers of one flower while they are immature. Generally the floral leaves of the bud must be opened in order to do this. Then procure pollen from the flower with which it is desired to make a cross, and apply it to the pistil (stigma) of the other. To prevent the interference of insects or the wind, the mother flower should be covered. 2. The R. N.-Y. raised Brazilian Flour corn the first year it was announced. It is rather late for our climate. The ears are small, the grain white. From two to six ears are borne on each stalk. The grain makes an excellent quality of flour (see back numbers—Domestic Economy Editorial notes, and communications from contributors) better than that of any variety of corn we have tried.

THE AUSTRIAN PINE.

W. H. S., Oakville, Can.—What sort of a hedge would Austrian pine make? Will it stand clipping back the same as the Norway spruce? How far apart should the trees be planted to make a wind-break?

ANS.—Yes, they will stand cutting back the same as Norway spruce. We would not use

either for a hedge. As a wind-break they would prove serviceable. The Austrian pine cannot be confined within hedge limits and live many years. For a wind-break we should plant 30 feet apart.

A POSSIBLE PROGENITOR OF A POLLED JERSEY BREED.

A. G. R., Alpena, Mich.—My high-grade Jersey cow never had any horns. A month ago she dropped a calf which has no sign of a horn, though its sire was a full-blooded Jersey. If she continues to drop hornless calves, would she be more valuable than if her progeny had horns? She is nearly pure-bred, is a fine milker, and has all the "points" of a Jersey except the horns.

ANS.—We should value that cow highly as being the possible ancestor of a race of polled Jerseys. Now, if you could but find a hornless Jersey bull, the basis for such a race would be secured. Otherwise it will have to be effected by in-and-in breeding.

ABOUT THE WOMEN'S POTATO CONTEST.

J. A. B., Lima, N. Y.—In the Women's Potato Contest must the plot be square? How near the edge must the first hills be—that is, should the 33 feet be measured from the first to the last hill or would it include a space outside equal to the width of the row?

ANS.—Suppose you make 11 rows, each three feet from the other (measuring from the middle), and in each row plant 33 pieces. You will find you have just one-fortieth of an acre, or, in other words, 363 "hills." The plot need *not* be square, though it is probable that not less than seven rows will be settled upon by the judges. In this case there would be 52 hills in six rows and 51 in the last. The R. N.-Y. will give full instructions in a short time.

ORIGIN OF ISOLATED ROCKS.

Subscriber, Genesee County, N. Y.—On a farm in this section are two rocks of porous limestone with some flint, which weigh several tons each. They are three rods apart, and there is no other rock within 100 rods of them, and no rock of the same kind in this entire region. Where did these two come from?

ANS.—These rocks are evidently relics of what is known as the glacial period when the surface of the earth in the greater part of the northern hemisphere was covered with vast beds of ice or glaciers. As the climate gradually changed this ice melted and formed floods which poured down the slopes carrying rocks, gravel and sand which were deposited over great spaces, forming what geologists call the glacial drift, which is made up in great part of rounded masses. But as the ice broke off from the faces of the glaciers—of the extent of which we can form no conception from anything existing now—large rocks adhering to or frozen in the ice were floated off until the ice grounded in shallow water and, melting, dropped the rocks where they are now found. The general direction of the current was from the northeast, as is shown by grooves and scratches worn in bare, smooth solid rocks over which the ice and floods passed; and if the origin of these masses of loose rock is sought it will be found in this direction. Geologists have never failed in detecting the birth-places of these strange rocks by following the rules indicated by patient and skillful investigation. Lyell's Principles of Geology gives an interesting account of this glacial period of the earth's history. The rocks have probably come from the neighborhood of Labrador or the region about Hudson's Bay or further south in Canada, a distance of 300 or 400 miles.

RAISING ONIONS.

G. W. L., Napoleon, Ohio.—How can onion sets be raised so as to have them the right size and shape? A great many onions are raised here every year; but none of the growers knows how to raise the sets, all of which are imported from other places.

ANS.—There are four different kinds of sets used by market gardeners and ripening in succession as follows: 1. The potato onion or multiplier; 2. The rareripe or medium-sized set; 3, The top or tree onion; 4. The pip, or button set. They are produced or raised as follows: The potato onion is grown by setting out the onions in rows two feet apart and eight inches in the row. Each onion divides and splits up in the ground, forming a bunch or cluster of eight or 10 large and small onions. The smallest ones are kept for seed. 2. The rareripes are any of the seed onions of small size; usually the size of a black-walnut. They are set out in rows two feet apart, and three to four inches apart in the rows, the old onion growing and forming stalks, a new one forming in its place. These are used only for early onions, as they will not keep long.

3.—Top or tree onions are set out the same as potato onions. When this onion ripens it forms a cluster or bunch of from 10 to 20 small onions on top of the stalk. These are used for seed for next season's planting, for the purpose of raising market onions from them. 4. For pip or button sets, prepare the ground in the same way as for seed onions: rake it down smooth and lay it off in beds 18 inches wide, with alleys or paths 18 inches wide in which to walk when weeding. Drill the seed in the beds from three-eighths to one-half inch apart, and about a quarter of an inch deep; roll down tightly to facilitate the sprouting of the seed. The seed will sprout in about two weeks and show above ground. Then go over the ground and clean out all weeds and grass. Continue to keep the bed clean until the onions are ripe, which will be seen by the tops wilting and falling down. They should then be pulled and cleaned from the soil, by throwing them in a coarse sieve and they should then be left to dry thoroughly, after which they can be spread out on a floor under cover about two or three inches deep, until frost comes. Then pile them up in heaps, covering them lightly with coarse bagging or straw. Increase the covering to prevent freezing. They must be kept as dry and cold as possible, without freezing. The yellow Strasburg is the best for sets. The planting of the seed so closely exhausts the nutriment from the soil and prevents the bulbs from growing large. The distances of rows stated above are for raising sets so that they can be tilled by a cultivator or plow. For garden beds, place the rows one foot apart.

THE RURAL BLUSH POTATO, ETC.

J. S. G., Red Bank, N. J.—The inclosed potato is called the Rural Blush hereabouts where it is extensively grown and well liked for its good quality and productiveness. Last year it grew hollow-hearted on heavy soils, and was inclined to rot, and on this account shippers objected to handling them. Is the specimen sent Rural No. 2? If not what name should it go by?

ANS.—The specimen sent fairly resembles the Rural Blush in every way. The Blush and the R. N.-Y. No. 2 must not be confounded. The RURAL NEW-YORKER introduced the Blush years ago. It did not originate with us at all, but with Mr. E. S. Benham, of Attica, N. Y. The Blush has shown this tendency before. When cutting seed *every potato showing a decayed center or "hollow heart" should be rejected.* In this way this serious objection may be entirely overcome.

GRASSES FOR EASTERN OREGON, ETC.

R. A. S., Joseph, Oregon.—My soil is a black sandy loam with some gravel in it. I have plenty of manure and lots of water for irrigation; what grasses should I sow for a permanent pasture? Will buckwheat mature here?

ANS.—If any one can answer these questions without experimenting he will confer a great blessing on the farmers of Eastern Oregon. Oregon is such an enormous State, embracing such a diversity of climate, soil and physical characteristics and, withal, so sparsely populated, that accurate experiments have not been conducted. Prof. Grimm, of the Oregon E. S., states that no grasses that he knows of have been found to take the place of the native Bunch-grasses of Eastern Oregon. The Fescues have been recommended. For irrigated land he thinks Alfalfa is the very best crop. He says these questions are often asked, but as yet no one has been able to answer them. The country surrounding Joseph is new and but little is known of its agricultural capabilities.

"CURCULIO-PROOF" PLUMS: THE LE CONTE FOR GRAFTING.

C. C. W., Grand Bay, Ala.—1. Are there any curculio-proof plums, and if so, what are they? 2. What has been the result of grafting the older sorts of pears upon Le Conte roots both as to growth of tree and quality of fruit? 3. Is it true that the grafting of Le Conte cions upon common pear stock has resulted in producing a fall-blooming tree, and in consequence a failure of the spring or summer crop of fruit?

ANS.—1. There are, properly speaking, no curculio-proof varieties of the plum; though the Chicasaw and Americana species have each numerous varieties which are believed to be less attractive to this insect; and in which the eggs frequently, if not even generally, fail to develop into mature larvæ. There are also several varieties of the Domestica or *Garden* plum, for which it is alleged, (with how much occasion it is yet impossible to determine), the "Little Turk" has a dislike. The same is alleged to be true of some or all the recently introduced, and, as yet, imperfectly tested Japan plums. How far all or any of these claims will prove valid in practice, is yet to be determined, but it is safe to assume that the apparent evidence is the mere result of preference; and that, when short of pasture, this persistent enemy will be sure to attack even these to him least desirable.

2. At the extreme South, (doubtless as the result of climate and the consequent temperature and moisture of soils), the Le Conte pear is readily propagated by cuttings, which root promptly, and make fine stocks on which other varieties may be grafted. As we go northward, this method of propagation becomes less and less practicable; till, in the more northern States, this variety is more conveniently increased by working, in the usual way, upon stocks already rooted. Not infrequently the occurrence of warm, moist weather, after growth has apparently closed for the season, causes a resumption of growth and the consequent fall blooming of the fruit buds formed for the next season's crop. This occurs occasionally at the North; and, possibly, even more frequently at the South, insuring the loss of a crop the next season. We are not aware that this is peculiar to any one variety; to the use of any particular kind of stock; or to any particular combination of varieties.

FOR THE LARGEST CORN YIELD.

A. H. H., Rayville, Md.—I have a piece of ground I am thinking of planting in corn. It is rich enough to yield 20 bushels of wheat per acre by the use of fertilizers. It was in cabbage and beets last year and produced fair crops. I am putting manure on it over again to be plowed under. 1. How should corn be planted on this land so as to get the largest yield? 2. Would the RURAL recommend the Mapes potato fertilizer in preference to others? Could I use half a ton per acre with profit? 3. When and how should the fertilizer be applied? 4. What kind of corn should be used?

ANS.—1. In four feet apart. Drill in the seed about three inches apart, then cut out at the first hoeing to 14 inches apart. We should give *frequent shallow* and *flat* cultivation. 2. We know of no fertilizer better worth the price. Half a ton per acre would be about right. If expense be not regarded, use 1,500 pounds. 3. Make the first application before harrowing. Use 1,000 pounds. Make the second application (500) when the corn is knee-high. 4. If you don't mind gigantic stalks, Chester Co. Mammoth will give you as large a yield of grain as any kind we know of.

THE LAWSON PEAR.

E. R. P., Conway Center, N. H.—1. Will the Japan hybrid catalpa be hardy as far north as this place? Our coldest weather is 20 degrees below zero. 2. Is the Lawson pear as good as the Bartlett? Would it be advisable to plant it for a home market?

ANS.—1. No. We do not believe it will stand your climate. 2. No, its quality is inferior. It is a showy pear and of large size for one so early. It is therefore valuable for market.

PEACH AND APPLE QUERIES.

G. W. D., Fallsburg, Ohio.—1. Would peach trees do well on land just cleared—a sandy loam on top of a hill? 2. How old should the trees be? 3. What varieties? I want some for market and some for home use. I also wish to plant 30 more apple trees. 4. What kinds should I get? 5. Would a good mulch do instead of plowing the orchard?

ANS.—1. The land described would be well adapted to peach growing, assuming that the subsoil is sufficiently porous not to be wet or springy. 2. Peach trees should never be planted older than one year from the bud. 3. George the Fourth, Coolidge, Grosse Mignonne, Morris's White and Druid Hill will afford a good succession of peaches for home use. Mountain Rose, Crawford's Early, Crawford's Late, La Grange, President, Shockley's Early, Stump the World, and Ward's Late are all popular market varieties for Ohio. 4. Belmont, Ben Davis, Benoni, Chenango, Grimes's Golden, Jonathan, Maiden's Blush, Oldenburg, Peck's Pleasant, Rambo, Red Astrachan, Red Canada, Rhode Island Greening, Rome Beauty, Smith's Cider, Summer Queen, Willow Twig and Yellow Bellflower are all double-starred for Ohio in the catalogue of the American Pomological Society. The proposed addition to the apple orchard should probably be made up from these; the selection to be made to supplement what our friend already has, and with reference to the season and varieties most in demand. Before making up the lists, he will do well to learn which of these varieties have proved most profitable in the vicinity, on similar soils. 5. An orchard should be thoroughly cultivated with hoed crops, if any, till the trees have been five or six years planted. Mulching would doubtless be a benefit, by keeping the soil cool and moist during the hot season, if cultivation be not intermitted in consequence. In an old orchard, mulching may be profitably practiced, at least as a partial substitute for cultivation.

CHICKS.

W. H. A., Walton, Del.—I want to raise chickens by means of an incubator and brooder. Taking into consideration my distance from market, and the severity of the winters in this section, which would I be likely to find the more profitable—to raise my chickens in the winter and sell the cockerels for broilers, or to raise them in the spring, and caponize them? 2. Do all dealers require broilers to be dry-picked? 3. Can broilers be shipped alive, and would the prices make it profitable to raise them? 4. What is the address of a reliable dealer to whom I could send broilers?

ANS.—Unless you have had experience it will be more difficult to raise broilers in winter than in spring. It will pay well to caponize the cockerels. 2. Yes. 3. They cannot endure exposure while *en route* to market if alive: some of them will perish. It is easier and cheaper to ship them dressed, by express. 4. There are so many dealers that it is almost impossible to name any claiming to be more reliable than others. E. & O. Ward 279 Washington St. and A. & M. Robbins, Fulton Market, do a large broiler business, and are quite trustworthy.

THE CUCUMBER FLEA-BEETLE.

E. F. G., East Hampton, L. I.—What is a description of the Flea-beetle which was so destructive to potatoes at the Rural Grounds and elsewhere during the past season?

ANS.—The Flea-beetle was illustrated in the R. N.-Y. of August 18, 1888, to which our inquirer is referred. It is a small black flea that hops away as soon as disturbed and then hops back. It eats holes in the leaves which finally become so numerous that the tissue is destroyed and the leaf blackens and dies. This beetle is known to have been destructive (during particular seasons) for 50 years or more, though in most cases it was not suspected to be the cause of the destruction. The R. N.-Y. was the first to make known its depredations the past season and to show that many vines thought to have been killed by "blight" were in reality killed by the beetle.

MONEY FOR EX-SOLDIERS.

D. K. G., (no address).—Where must soldiers apply for their mileage home from the place of discharge, pay for extra duty between April and October 1862, and the 28 cents per day while in prison or on furlough?

ANS.—The above inquiry was doubtless prompted by remarks made about New Year's by Private Dalzell. At the time the RURAL said that a telegram just received from Washington, cast considerable doubt on the correctness of the "Private's" statement. We sent the inquiry to General Black, Chief of the Bureau of Pensions, Washington, D. C., and have received the following answer:—"There is no law allowing five cents a mile, or any mileage to soldiers or enlisted men. Nearly *all* those soldiers entitled to commutation of subsistence and travel pay, act of July 22, 1861, have already been paid it. No transportation pay is due to soldiers while traveling on furlough.

"Nearly all volunteer soldiers entitled to extra duty pay have received it, and section 35, act March 3, 1863, repeals all laws in force as to such pay for *volunteers* for extra service performed *after* March 3, 1863, with only a few exceptional cases.

"Nearly all soldiers who were prisoners of war, and their heirs, under act July 25, 1866, and act March 2, 1867, have received pay for rations allowed under said acts. The Commissary General, U. S. A., War Department, and the *Third* Auditor of the Treasury, have jurisdiction of these claims, and also for pay for subsistence while soldiers were on furlough."

GOOD HARDY APPLE TREES.

O. S. F., Mt. Dora, Fla.—I have an apple orchard in Western New York, on a hill high up, at the head of lake Chautauqua, and my Baldwins and R. I. Greenings winter-kill a good deal. I wish to plant substitutes that will be hardier and yet as good in quality and size, and I have thought of Ben Davis and Wealthy for red apples, and Pewaukee and Peck's Pleasant as substitutes for the Greening. Which would be the better? Perhaps the RURAL can suggest better kinds.

ANS.—Ben Davis is too poor in quality, and Wealthy would not keep long enough for a shipping apple, though it is all right for a near market or an early winter or late fall sort. Of the two, Ben Davis would pay the better as it will keep until apples begin to get scarce in the spring. McIntosh Red is fully equal to the Wealthy as a keeper, and might prove more profitable, as it is of the highest dessert quality. In some places it is subject to spotting, but in many it grows quite fair. It is as large as the Baldwin. There is no first-class long keeper that is truly iron-clad,

but where the Ben Davis succeeds the Golden Russett of Western New York can generally be grown. Pewaukee is a coarse apple that would be hard to introduce. Peck's Pleasant is not hardy enough, we fear.

Miscellaneous.

C. A., Medina, N. Y., can get Hamburg fowls from D. S. Baird & Sons, Johnstown, N. Y. or P. P. Oster, Batesville, Ohio.

F. J. P., De Smet, Dakota.—The bulletin on turberculosis, which is very complete, is issued by Prof. C. H. Fernald, Amherst, Mass.

E. P. N., Nichols, Conn.—Good wire netting can be obtained from Peter Duryea & Co. or Brockner & Evans, Vesey Street, New York.

A. G. S., Dover, Del.—Will some reader of the RURAL who lives in a section where peanuts are extensively grown, tell us "all he knows" about their culture and marketing.

R. L. H., Brighton, N. Y.—What is the newest and best late potato?

ANS.—We consider the R. N.-Y. No. 2 the "newest" and best late potato.

H. S., Fort Collins, Col.—Who manufactures the new lever harrow spoken of in a late RURAL?

ANS.—The Moline Plow Company, Moline, Ill.

H. M. M., Vienna, Austria.—The Secretary of the American Pomological Society is A. A. Crozier, Washington, D. C. Copies of the report of the society can be obtained from him.

A. H. H., Brunswick, Me.—You can obtain from the United States Fish Commissioner at Washington, D. C., a set of pamphlets giving pretty full information regarding carp culture.

J. W., Park Lake, N. Y.—How can I get rid of little black flies on house plants? I have tried hellebore, soap-suds and ammonia, in vain.

ANS.—Tobacco water is the remedy. Spray it upon infested parts.

J. W. D., Baden, Pa.— Would it be advisable to apply a good coat of well-rotted sawdust to corn stalk ground, principally clay, to be cultivated with a sulky cultivator and sown to oats?

ANS.—*Well rotted?* Yes, it would lighten the soil and furnish plant food as well.

E. A. B., Kittanning, Pa.—Is the Brownell's Winner potato, so favorably mentioned in the RURAL of February 16, for sale by seedsmen?

ANS.—It is not yet offered for sale. E. S. Brownell, of Essex Junction, Vermont, is the originator.

W. A. McC., Rozetta, Ill. Which kind of White-oak posts will last the longer in the ground—those newly made and set at once, or those well seasoned?

ANS.—It seems to be pretty well established that, other things being equal, the seasoned posts are likely to outlast those set while green.

G. R., Johnson's, N. Y.—Can potash be applied to a young peach orchard in any other way so as to have the effect of wood ashes?

ANS.—Yes, use kainit or muriate of potash. Add bone or South Carolina rock (dissolved) for phosphoric acid, a small proportion of which the ashes would supply in addition to the potash.

F. A. B., Erie Co., N. Y.—What amount of barley or oats should be sown per acre in seeding to grass?

ANS.—The R. N.-Y. has had no experience with barley. Would be glad to hear from our readers. We use 1½ bushel of oats. Much depends upon the land. If rich, use less seed; if poor, more.

Subscriber, Kingston, N. Y. —It has long been argued by growers of celery at Kalamazoo and elsewhere, that artificial fertilizers, without stable dung, would not grow celery. What says the RURAL?

ANS.—The R. N.-Y. has used both stable manure and chemical fertilizers—never the latter alone. We shall be glad to hear from others on the subject.

C. W. G., Canterbury, Conn.—1. Is the white strawberry any good? 2. Has the RURAL had any experience with it? 3. Is Burpee's Louise as good as the recommendation says it is?

ANS.—1. Yes, it is of the finest quality, but a poor yielder. 2. Yes. 3. We are inclined to think it is. We shall know more about it next season, as our plants were set last season.

L. S., Prescott, W. T.—In an influential paper here there appears an advertisement of White's Northern Muscat grape, which is said to be "the grape for the people all over the United States." Is this claim well founded?

ANS.—The claim is absurd. We don't know anything about this variety; but we do know that any grape of Muscat parentage will mildew away from such a climate as that of California.

M. N. Mc. N., Sherwood, Ohio.—Where can I get the Chili pine, called the Monkey tree by some, because a monkey cannot climb it?

ANS.—Araucaria imbricata. This is a native of South America. It is a fast grower under suitable conditions, thriving in the Southern States. It should be planted in northerly exposures. It thrives among rocks and in gravelly soils. Try P. J. Berckmans, Augusta, Ga.

W. D P., Camp Springs, Md.—What is the best kind of soil for the Bubach strawberry?

ANS.—The RURAL plot consists of a soil that may be called a mellow loam; that is, not clayey enough to become baked and hard, or sandy enough to be called a sandy loam. It rarely suffers from either drought or too much rain. Bubachs thrive well. We learn that the variety succeeds well in stiffer soils, but can not say as to sandy soils.

F. C., Ironville, Ohio.—1. The RURAL, in a late issue, recommends cutting off the seed-end of "seed potatoes;" does it recommend their rejection for planting? 2. In feeding ground grain to cows, should it be fed dry, or moistened, or quite wet?

ANS.—1. Yes, we would reject them except in the case of new and high-priced kinds. The seed-end gives too many sprouts, and, as a consequence, too many small tubers. 2. It should be moistened throughout, but not *wet*.

G. S., Union City, Mich.—Can the Bartlett pear be grafted on the crab apple? If not, what fruit can be successfully grafted on the crab?

ANS.—Yes, it can be, but the cion will make a short-lived growth. You can graft the edible quince, also the ornamental quince, all sorts of cratægus, the amelanchier (Juneberry, Shad-bush, Service-berry.) We do not know of any valuable fruit, except all kinds of apples, that can be worked on the crab.

B. N., Broadalbin, N. Y.—Last fall I plowed a piece of sandy loam land on which sheep had pastured for 12 years. I intend to plant it with potatoes and corn; what would it be advisable to use in the drill—some commercial fertilizer or plaster and ashes?

ANS.—If ashes (unleached) were used, we should add bone—not plaster. Besides the ashes and bone, nitrate of soda and sulphate of ammonia would help the crop, as the ashes do not furnish nitrogen and the bone does not furnish enough.

C. Y., Bangor, Me.—1. Would it be advisable to plant the Rural Thoroughbred Flint corn for ensilage in this latitude? 2. Would it pay to plant the Rural New-Yorker No. 2 potato by the trench method in preference to the Beauty of Hebron at their respective prices?

ANS.—1. No; the Rural Thoroughbred Flint corn will not mature ears with you. 2. The No. 2 is now, we learn, $16 a barrel. That is too much. The difference from the trench would not pay you. It might be well, however, to plant enough to find out how it will turn out in your section.

H. R., Brookfield, Mass.—I can buy steamed ground bone for $30 per ton and unleached wood ashes for 20 cents per bushel; what shall I add to make a complete fertilizer, and would the mixture be cheaper than the average commercial fertilizer?

ANS. This question cannot be answered without an analysis of the bone. Much depends upon the nitrogen left in the bones. The price for the ashes may be low or high. This depends upon their purity and from what wood they come. The mixture would probably need nitrogen in some form to render it a well-balanced "complete" fertilizer.

R. H. S., St. Joseph, La.—1. What is the character of the Green Mountain, Everitt, and O. K. Mammoth potatoes? 2. We plant potatoes here in January and February; which two kinds would be preferable for extra-earliness and productiveness? 3. Has the R. N.-Y. its No. 2 potato for sale?

ANS.—1. Our first reports are corroborated by trials since. All three are fine yielders. The quality of the Everitt is good—that of the O. K. Mammoth fair; of the Green Mountain fair also. 2. Our inquirer is referred to the Vegetable Special for the best of the early potatoes. 3. The R. N.-Y. No. 2 is offered by several seedsmen. See catalogue notices Feb. 16. We have never sold seeds, potatoes or anything whatever except the R. N.-Y.

Several Subscribers—We have seen several references to a machine for picking apples. Is it of any practical benefit to fruit growers, or is it on a par with a milking machine for usefulness?

ANS.—We have never seen the picker, but have heard it well spoken of. It was described on page 594 of last year's RURAL. As to its usefulness, those who have handled it must speak. Mr. J. Harris, a well-known fruit grower of Orleans Co., N. Y., writes: "I used it for gathering my apples last fall and was highly pleased with its work. It is so constructed that it receives the apples as they are shaken from the tree and rolls them carefully into baskets in good condition without bruising, and, futhermore, it does not cost over half as much to gather apples with this machine as it does to pick them in the usual way."

R. W. G., Woosung, Ill. 1. What firms manufacture harvesters for cutting standing corn? 2 Who makes a corn-husking machine? 3. Would cooked pumpkins make good feed for hogs, especially for fattening hogs? 4. Who makes a pumpkin-seed-planting attachment for a corn-planter?

ANS. 1. Few if any of the harvester manufacturers care to advise farmers to use their machines for corn cutting. Some farmers do this work with the heavier machines, and with small fodder corn it might work; but the ordinary harvester is too light for cutting large field corn. 2 A corn-husker and stalk-crusher is made by the Keystone Manufacturing Co., Sterling, Ill. 3. Not if fed alone. They should be fed with some grain. Bran would make an excellent addition to a feed of pumpkins. 4. Try the Spangler Manufacturing Co., the Pennsylvania Agricultural Co., and N. C. Baughman or Hench & Dromgold, all of York, Pa.

S. J., Fairmount, Ind.—Can you tell me why, when a reader of the —— Farmer asked the editor to name the five best farmers' papers published in the United States, he left out the RURAL? Why does he talk so slightingly of the RURAL'S trench-mulch system? Does he offer us anything better? Can he do anything in that line that will compare with what the RURAL has done? The best crop of potatoes I ever raised was when I followed, as nearly as I could, the lessons I had learned from the RURAL.

ANS.—It may be that the editor of the —— Farmer thinks there are five better papers than the RURAL. This is a free country and this editor has a perfect right to his own opinion. As thousands of our best farmers think otherwise, the R. N.-Y. doesn't propose to feel sad about it. Why does he speak slightingly about the trench system? We must give that up. If he has offered anything better we have failed to notice it.

J. H. S., Hillman, Mich.—1. How do the Wealthy and Pewaukee apples compare with the Wagener as to hardiness of tree and quality of fruit for dessert, cooking and keeping? 2. Can the plum curculio be destroyed by poison?

ANS.—1. Wagener is about the same in season as the Wealthy, but is not comparable with it, or even with Pewaukee, in point of hardiness against winter cold. Wagener, when well grown and properly thinned, is a fine dessert apple; and the same may be said of the Wealthy, but both are prone to overbear. Pewaukee is a coarser apple, not so hardy as Wealthy, but a better keeper. In quality it cannot be ranked as a dessert apple. 2. So far as reports go, early spraying of the leaves of plum trees with Paris-green appears to be fatal to the parent curculio beetles, and in this way protects the fruit. It is a cheap remedy, and well worth trying. It should be applied several times, beginning before the flower buds open, and be repeated occasionally until the young fruit is as big as peas, at least.

DISCUSSION.

DIFFERENT BREEDS OF POULTRY.

D. M. K., SHIMERVILLE, PA.—Within the last ten years I have learned that it pays to raise pure-bred poultry, and that it doesn't pay to raise common fowls which one must sell at eight or ten cents per pound. Last fall I had one dozen pullets, one dozen cockerels, and nine hens that I did not wish to keep over winter, so I sold them to a poultry huckster at eight cents per pound; the 33 head brought $11. I was satisfied that I did not make 33 cents on the lot. If I had have 33 head of my pure White-Crested Black Polish birds to spare I could have got $33 a little sooner than I got the $11. I have not sold one of my Polish fowls for less than $1 apiece, and often I got from $3 to $5 apiece. I can also raise them much cheaper than I can raise the larger breeds, and in number of eggs per hen my Polish always come out victorious. During the hot summer months when the hens of the large breeds are broody and one has much trouble in preventing them from sitting in a box or sometimes on the bare ground, he will find Polish hens laying almost every day. At least this has been my experience for the last ten years.

RIGHT TO THE POINT.

M. H. W., MOORE'S HILL, N. Y.—If the cartoon on the first page of the R. N.-Y. for February 9, could be rightly understood by every one, it might help to enforce a sound principle; viz. the necessity of keeping out of debt. But I fear that by far too many will see in that picture some of the evils that affect them, and overlook the fact that the worst ones are self-imposed. Who compels the farmer to run in debt? Does he buy more land than he can pay for, without knowing it? Are farmers so dull that they do not know the nature of a debt when they assume it? If they assume it understandingly and cheerfully, then why do we hear and say hard things about mortgages and lenders? I would place heavy indebtedness by the side of drunkenness, and a man would be far better off by not contracting either. In fact, I think if the riders on that poor typical farmer's back had been named "Intemperance" "Lost Time" "Waste" "Dishonor" "Ill-health" "Crime," the moral would read, "Avoid these evils by not contracting them to start with."

One of the best of rules is to pay very nearly as we go. But some will ask about those who are always in debt. S. E., on page 135, truly says that well directed frugality and prudence will alone subserve our best interests. I have been a farmer continuously for 41 years. Inheriting a farm quite heavily mortgaged and run down too, and living not only to lift the mortgage but to loan to some who need, my experience teaches that S. E.'s saying should be printed in large letters, framed and hung in a most conspicuous place in every farm house. "Farming don't pay" the weak one who spends his money to make a vain show or the one who always "sees a lion in the way;" but farming does pay the man who is strong enough to do right and brave enough to live within his means.

R. N.-Y. AMEN!!

TURNIPS FOR BEEF CATTLE IN THE EAST.

C. P. W., WOODRIDGE, N. Y.—We listen to a good deal of advice to dairymen about growing turnips and mangels for stock food. How about the use of these roots for feeding beef cattle? Are any Eastern farmers making beef with the aid of turnips? In spite of all that is said about the changes in the beef business produced by the dressed beef trade, it seems as though farmers might still make the business pay.

R. N.-Y.—Mr. R. H. Van Deusen, of Hartford County, Conn., has made quite a success of steer feeding. He writes us the following account of his method of growing and feeding turnips for the purpose of beef production:

"I select a piece of run-out mowing land that has produced a crop of hay, turn the sod flat, put on the roller to make it solid, and apply 15 common cart-loads of stable manure per acre. Then I use the wide spring-tooth harrow, which pulverizes the soil deep, and makes it a friable seed-bed. If I intend to mow this field, I seed with 16 quarts of Herd's-grass seed per acre, having thoroughly mixed three pounds of New Globe turnip seed with it, sowing broadcast on August 1. It is a good plan before sowing to mark out the plot with a chain in lands ten feet wide so as to make sure all the land is covered with seed; then apply a light brush; then roll it with a light roller. By this method I have almost invariably harvested 400 bushels per acre without one dollar of extra expense and with no perceivable harm to the following hay crop. I take particular pains to harvest my turnips in a dry and clean condition. Turnips should be kept convenient to the feeding stable. I house mine under the feeding floor in the barn. I have a root gouge cutter; with turnips cut by this 'machine' there is no danger of choking the cattle. I feed to a 1,000-pound steer one peck of turnips per day; to a three-year-old steer 12 quarts per day. For the evening feed I add three quarts of wheat middlings. In the morning I feed the middlings clear with hay. The middlings prevent the steer from being too loose. The turnips save one feeding of hay per day and make better beef than hay and grain can make. To prove this I have this present winter fed 81 steers and sold them for 50 cents per 100 pounds more than the best refrigerator beef sold for in this market, so says the butcher that bought them. My success in feeding beef steers I attribute to the feeding of Globe turnips. It keeps the animals in a growing healthy condition."

THOSE "SYMPOSIUMS."

F. S., HYDETOWN, PA.—In the RURAL of February 16th I find the following:

"New readers may notice that there are four 'Symposiums' in this week's R. N.-Y. This is a feature inaugurated by us, etc." *I* am an *old* reader of the RURAL, perhaps *too* old to understand all the new inventions of the day. But in Webster's Unabridged Dictionary, published in 1878, the only definition I can find of the word "symposium" is, "A drinking party feast, to drink, a drinking together, a merry feast." Does not the RURAL'S use of the word need a little explanation for old men who are not initiated into these new inventions? Surely we can not bring ourselves to think that the paper would induce all farmers, potato growers, ladies, in short all the multitude of readers of the RURAL to go into a "drunk" two or three times a week, on any cause, or for any purpose. Won't the RURAL please explain, lest we should all go into the gutter together?

R. N.-Y.—We have a Webster's Unabridged of the edition of 1886. On page 1580 of this volume we find the following: "Symposium, *n.* [Add.] 2. A collection of short essays by different authors on a common topic; —from the appellation of the philosophical dialogues of the Greeks." Thus it is seen that the RURAL proposes during 1889, to invite its readers to a weekly feast of wisdom, and to frown, as usual, upon all "drunks."

FERTILIZERS FOR FLOWERS, ETC.

A. B., HARTFORD, CONN. I am sorry that while the subject was up somebody did not say something about the kind of fertilizers best suited for flowers, or rather for the flower garden. I am well aware that this is not very important, still how many are interested in the subject. It is very difficult to get good barn-yard manure. Coarse stuff that will do for spreading over the ground and plowing in for crops in general, will not answer at all. Last summer I used some that I thought was good because it was fine; but I am inclined to think the goodness had been washed out. There are now thousands of chrysanthemums grown every year. These generally are taken up and put into their blooming pots about September 1. The soil should be rich and they also require liquid manure; finally when the pots are filled they contain literally a mass of roots. What kind of fertilizer is the best for them? Of late years great attention is given to dahlias. The United States Nurseries at Short Hills, N. J., issue a special catalogue of these plants. It would seem that an entirely different manure would be suitable for them. The foliage beet advertised quite extensively last season by Hallock & Son, is very ordinary. My opinion is that it is a humbug. Many novelties advertised with flaming illustrations are good for nothing Persons are simply fooled when they buy them.

R. N.-Y. We should use for hardy flowers of all kinds a high-grade complete fertilizer—the same as those advertised for cereals or even potatoes. They do not differ in plant food materially. The ornamental beets when *true to name* are beautiful plants. We began raising them for borders and even for solid beds 14 years ago. Their variegation and distinct colors are not much surpassed by any plants used for the same purpose.

DISEASE ON SWEET POTATOES.

E. G. B., PENN'S GROVE, N. J.—Since reading the RURAL'S remarks on the use of sulphur to prevent scabby and worm eaten potatoes, I have wondered if it would do any good in preventing "ground rot" in sweet potatoes. This disease has never struck my land, and has shown itself only in those fields that have produced Southern potatoes, either for several successive years, or which have been so cropped year after year, or with only little intermissions, and as I practice rotation, I have never seen it in my fields.

The first symptom of "ground rot" is noticed in digging the crop, when some potatoes appear to have been eaten by worms just as white potatoes are eaten by the pests. At first only a few show the marks; but more are affected in the next crop, and in succeeding years the matter grows worse and worse. At first the vines die only when nearly full-grown; but year after year the disease takes them earlier and earlier until the crop is an entire failure. If the ground is allowed to rest for several years, the rot will not show itself again until the field has been heavily cropped for some years again.

I have heard many theories advanced to account for this condition of things. It is thought by some to be due to the exhaustion of some of the available plant-food ingredients of the soil; while others attribute it to the ravages of insects, and others again think it is the result of fungus growth. I have known crops to be grown on "diseased" land by the use of commercial fertilizers, without any stable manure. Some crops grown with Mapes fertilizers showed little signs of rot where previous crops had been total failures or nearly so. What do RURAL readers think of the matter? Is the use of sulphur likely to prove beneficial in this case?

THE MONTANA HIRED MAN.

A. C. C., LIVINGSTON, MONTANA.—The articles regarding "help" have been very interesting. In the East the hiring seems to be conducted principally on the time-contract system. Men are in this manner bound to their employers for at any rate the period contracted for. Here the system is different. The employer simply employs a man. He may demand his wages at any moment, under the influence of the go-west fever; and however scarce labor may be, however well the employer is suited, the check is written and one has to begin the search for another man into whose ways one must get, and whom he has to instruct in his. Wages are high—$35 a month all the year round, are what I pay in the vain hope of retaining the services of a good, steady man, and during plowing, seeding and haying I have had an additional hand. The work is not hard, consisting of milking 10 or 12 cows, looking after a couple of teams, and being generally handy upon a ranch of small size. I am a bachelor, do all my own cooking and house work, look after the garden and dairying, as well as lend a hand with pigs, poultry and other work. The day's work commences at six in summer, and is always over by the same hour at night, as far as the help is concerned. In winter the stock are fed at 7 A. M. and all are housed, fed, and chores done by sunset. The house is comfortable, there are plenty of books to pass the evenings with, and every comfort I have I share with my man. Suddenly the help is seized with a craving for change, and announces his intentions of "going away visiting." Whether he will return or not, he is unable to say, and so, just when labor is scarce, work plentiful, and I am looking forward to spring duties, there I am *planté la.* My help is just leaving, after nearly 12 months. He knows my ways; I his, and we are good friends in every respect. He has been steady, trustworthy, kind to the stock, and a good worker. He has saved money. In my inmost heart I guess he wants "a woman" and is starting off on the hunt! Then he will go to Washington Territory and spend his savings as soon as he arrives or before. Where can I get a successor—an honest hard-working conscientious farm hand who can appreciate a good home, and who if he so choose may educate himself considerably in more ways than one? Hardly can such a one be found in town by inquiry of saloon-keepers or stable-men. What becomes of the farmer's young sons? Do they always share in the parental acreage, or do they always aspire to the *dignity* of city professional or commercial life? Are there no farmers and dairymen in embryo to whom a good home, wages, and experience would be a benefit before a personal undertaking? When countrymen all flock citywards they may help the city, but they kill the country. What sort of a physical corporation is that in which the best blood rushes to the heart and stays there?

SOME IDEAS OF HARROWS.

W. V., FRANKLIN, N. J.—I feel quite interested in the talk about harrows, and am an advocate of spreading manure as fast as it accumulates, and now I believe most farmers think that manure should not be put too deep under the surface. When I was a boy my father used to plow in his manure; but at this day most farmers plow first and spread the manure on top, in which case the manure must be very short or any spike-tooth or spring-tooth that I am acquainted with will drag it up in heaps. If a spike-tooth harrow has the teeth set at such an angle that they will not heap the manure, then they will be of very little use except to smooth the surface. If oats are put on corn ground or corn is grown on sod, one should plow in the fall; spread the manure in the winter and in the spring use a disk or Cutaway harrow. I think I prefer a Cutaway. For preparing corn ground in the fall for rye or wheat, use a Cutaway harrow, and lap half, then use a light, smoothing harrow and the ground will be in good order and the manure where it will do the most good, and at the least outlay of time and expense; at least that is my experience.

WANTED—A SMALL, CHEAP ICE-MAKING MACHINE.

E. E. B., NORFOLK, VA.—We Southern dairymen sadly need an ice-making machine suitable for private dairies of 25 cows and upwards. Ice has to be bought, and $4 to $5 per ton and waste make a heavy tax. Ice is made artificially already by wholesale in many of our large cities, but we want a machine for private use. I have an eight-horse-power engine that I use for grinding grain, cutting fodder, etc., and it seems as though some of the inventors or manufacturers of the wholesale ice machines, could easily devise one of smaller proportions that could make ice cheaply for farmers' use; it would find ready sale. I know of several dairymen who want to buy such machines, and I think there are other branches of business that would do so. For instance, during the past two or three years, the leading truckers pack ice with their late shipments of radishes, spinach etc., and find that it pays them. Can't the RURAL agitate the matter?

R. N.-Y.—Such a machine is certainly a desideratum and if invented and sold at a moderate figure, would certainly have a large sale.

KILLING HOGS IN OREGON.

R. A. S., JOSEPH, OREGON.—I must tell Charity Sweetheart how we kill hogs out here. Perhaps by next hog-killing time she can persuade the men folks to have a like arrangement. In the first place, the person who intends to kill wants a sheet of galvanized iron; then he must make a box out of 2x14-inch plank. It must be wider at the top than at the bottom. Let him nail the sheet of iron on the bottom and let it turn up somewhat at the ends, as this makes it stouter there. It is better to have the sides of the box project over three inches. Then some tin or sheet-iron should be nailed under and over the ends to prevent burning. So much for the vat. Now dig a hole a little longer than the box, set the latter over it, put in some stove-pipe at one end of the hole, bank the dirt around it, and you are ready for fire and water. Build a platform on one side on which to dress the hogs, and make a small one on the other side on which a man can stand. When you are ready you want a long rope; double it and spread it out over the vat with a man at each end. Roll your butchered hog on the rope, and roll him in and keep turning him around until he is ready to be taken out. Stand on the rope on the platform and you can roll the hog out with perfect ease. Two men can handle a large hog in this way without any difficulty.

CLOVER SEED AND THE MIDGE.

J. W., OHIO.—In this vicinity the clover midge appears in numbers on the first crop, that usually cut for hay, and again on the crop grown for seed after the hay has been cut. I noticed that for two years, clover in my yard, cut in May, had no midge in the heads and the seed was fine and abundant. In 1887 I cut nine acres of Medium clover about the middle of May, and let it lie as a mulch. From this I harvested, about August 10, 46 12-60 bushels of seed, or 5 8-60 bushels per acre. Last year I cut seven acres of Mammoth clover in the same manner, and harvested it about the same time, and the yield was 41 22-60 bushels, or 5 54-60 per acre. I could find no midge in either of these crops, while the pests nearly destroyed the seed crop grown after the hay cut in June.

(*Continued on Page* 165.)

What Others Say.

COST OF WHEAT PRODUCTION IN MICHIGAN.—From data furnished by the State authorities and the National Department of Agriculture, it appears that the cost of wheat production in Michigan in 1888, including plowing, fitting, fertilizers, seed-drilling, harvesting, stacking, thrashing, marketing, interest at seven per cent. on the land, insurance, taxes and repairs, was $12.98 per acre, and for the five years ended with 1888, the average cost in the State was $14.22 per acre. The average yield of wheat in the State for the same five years was 18.53 bushels. Deducting from the total cost per acre the value of the straw and the rental of the dwellings, and dividing the remainder by the average yield per acre for five years, the net average cost for five years of producing and marketing a bushel of wheat was 66 cents for the southern tier of counties, 63 cents for the central counties, 60 cents for the northern tier, and 64½ cents for the State. The average net cost for all the farms in the State for five years was about 70 cents per bushel. The Agricultural Department places the average home price at 84 cents in 1885; 73 cents in 1886; and 74 cents in 1887. In the above calculation the labor of the farmer and of his work animals has been allowed full prices; still there doesn't seem to be much money in wheat-growing in Michigan. Michigan is a winter-wheat State, as very little spring-wheat is raised there even in the Nothern counties. Now the January crop reports of the Department of Agriculture put the average yield of winter-wheat in the country at only 10.3 bushels per acre in 1888. The average allowed Michigan in the above calculation is nearly eight bushels more than the average for the entire country last year. It is conceded by all that profit comes only from the surplus over the cost of production. A large number of farms must have produced considerably less than 10 bushels per acre last year. If Michigan which produced eight bushels per acre over that figure, made only a small profit on the crop, how stand those States and farmers who were a long way from being so fortunate?

FARM LIFE AND MUSCULAR MANHOOD.—Horace wrote nearly 1,900 years ago, extolling the life and occupations of a farmer living on his own land as the truly happiest life on earth. It is a happier and securer life now than it was then or down to within a century of our present time; for then the quiet, patient ruralists were victims of lordly pride and power. Now, and here, where there is acknowledgment of men's general equality, the farming class is felt to be the main-stay of national strength and is proportionately respected. But, as Horace said, the too fortunate *agricolæ* know not what advantages are theirs; and that is true still. They have but to unite to prove and use their present power in the State. Their youth, ruddy with health and strength, are beginning to cease envying the dapper dandies who flit about town streets or are shut up, pale and enervate, in stores and offices.

In France, where the terrible defeat of 1870 changed, to a great extent, a gay and fickle, pleasure devoted people into serious, earnest carers for their own and their nation's strength and life, and where a final life or death struggle over lost territory and humbled pride is in constant prospect, every effort is made to strengthen the minds and bodies of all the people. The schools are made in the highest degree effective for both, and after school age every young man, of every occupation and standing, without any exception, must go through years of military discipline. All students are exercised in gymnastic exercises in addition to manual training as part of their school drill, and we read of the President of the Republic encouraging the young men of Paris in those exercises of their muscles and lungs by attending exhibitions of them in the public parks. An afflictive experience often benefits us individuals, by checking the wantonness and indolence that prosperity breeds; and it is so, too, with nations.

PROHIBITION STRENGTHENED IN IOWA.—Another legal victory has been gained by the State of Iowa, in its contest with the liquor dealers, by a decision just rendered by the Supreme Court of the State in the "original package" case. The point involved, as condensed by Bradstreet's, was whether dealers could import liquor from other States into Iowa and sell it there in bottles or cases of bottles. The trial court held that the liquor dealers could sell beer in cases just as it was delivered by the carriers, and that such selling was beyond the power of the State to prohibit, as falling under the head of inter-State commerce. It held, however, that whisky which had been imported in bottles packed in cases and barrels could not be sold in bottles, though it could be sold in the bottles in the original packages. The Supreme Court, however, decides that in neither case can liquor be sold in Iowa; that the method of packing is not material, and that the only question is whether the dealers have a right to sell liquor in the State, a question which it answers decidedly in the negative. Of course as a Federal question was raised—that of the State's control of inter-State commerce—an appeal may be taken to the United States Supreme Court. The decision would have a very important bearing on the question of one State's legislation against importations of dressed meat from another State—which is very likely to arise before long. .....

SUGAR BOUNTY AND GLUCOSE.—The Senate Tariff Bill now pending before the House gives a bounty of one cent a pound to the manufacturers of sugar from sugar-cane, sorghum or beets. The glucose or "grape sugar" men are demanding a similar stimulus to their industry. They claim that they make 550,000,000 pounds of "grape sugar," every year, furnishing a market for nearly as much corn as is now sent out of the country. They say, therefore, that while comparatively few farmers will, in the near future at any rate, be benefited by the bounty on the other kinds of sugar, all the corn-producers will be more or less benefited by a bounty on glucose the manufacture of which now consumes about 100,000,000 bushels of corn. "Corn-sugar" is now to a large extent used by confectioners,

and competes with other sugars, when price will permit, for use in manufacturing, as in the making of size. Most of the sirups now sold are a mixture of cane and glucose sirups. On the basis of last year's production of grape-sugar, the annual bounty would be $5,500,000. The makers of maple sugar are also putting in claims for a bounty on their product.

SAMPLES AND COMMENTS.

EDUCATION AN INSURANCE. Adequate and universal education alone can make life and property safe in our cities. The wealth and display of the rich are, as a writer says, combustible matter, and the neglected children growing up in vice and ignorance will become the incendiaries who in some day of wild excitement, will combine to use the torch and the blast, unless we take them by the hand and by the heart while they are yet young, and lead them into safe and satisfying lines of life. We must have such education at any cost; it is indispensable to our continued existence as a prosperous people In French cities the homeless children are cared for by the authorities, fed, clothed and schooled, not alone in book learning but especially in industry and geniality, and they borrow the money to do it. It is not a matter of benevolence so much as of self-protection. We are mad if we think that we are doing enough with the schools we have. A terrible future is before us if we go on in giddy pride amassing individual wealth with no adequate insurance against its destruction by future desperate mobs of our own induction.....

MT. CARMEL is on a promontory which juts out on the eastern shore of the Mediterranean, in the Holy Land. A German colony of fruit-growers is established there. The situation renders it pleasantly breezy and it is becoming a health resort. A German lady who once recovered health there, left a large sum to build a pleasure-house and health-cure, and a good roadway, The monks of Mt. Carmel brought an action against the colonists when they began to build the road. This was decided at last in the Turkish court in favor of the Germans, but the costs consumed much of the legacy. The work will go on, however, and the monks will soon see more light than they have for centuries .....

PROF. HULST, at the last meeting of the N. J. H. S., was asked how to destroy the cucumber flea-beetle. He replied that the "ordinary poisons might be applied." The Professor ought to read the R. N.-Y.....

MR. O. F. BRAND, of the Minnesota E. S. (Faribault), says that he has planted an orchard of 900 Oldenburg apples. He believed this variety to be greatly superior to the newly introduced Russian varieties, and says that if any one will go through the country where 10,000 Russians have been planted, and then look where 10,000 Oldenburgs have been planted, he is confident from his observations that the observer will find 100 of the latter alive to one of the Russians.....

MR. E. N. MOUNIER says that if you want a hog with an eye that will roll up at you. with the look of a maniac and an expression of countenance that will make you shiver, breed to scrubs. But if you want stock that will carry the largest amount of corn to market in the way of pork—stock that will eat and be happy and if not fed will not squeal about it, breed Poland Chinas, and remember that as "eternal vigilance is the price of liberty," so eternal watchfulness is essential to successful pork raising. .....

MOST of us make a mistake by feeding at the wrong end of the hog's existence. We don't get down to business in the way of feeding until a month or two before we sell him for pork. This is all wrong. The main secret is in giving the piggy a good send-off during the first two or three months of his existence. During the first week of a pig's life it is quite important to feed the sow so as not to start too great a flow of milk, a handful of shorts twice a day in less than half a pailful of warm water being the best feed at the time. .....

THE AMERICAN FLORIST is raising its voice, the R. N.-Y. is very glad to see, in a positive way against the exaggerated pictures of catalogues. A man, it says, who publishes an illustration of a plant or flower which represents that plant or flower several times better than it really is, must be designated by the same name as he who sells goods from an extra sample and then fills the order with fourth-class stock. We cannot object to any one representing the best actual development that can be made of the plant or flower illustrated, but when that boundary is overstepped he who does it is dishonest and a swindler, for he is attempting to obtain money under false pretenses.....

THE New York Experiment Station says there is 12.29 per cent. less digestible albuminoids or flesh-and-muscle-forming food, in hay that has been kept over one year as compared with new hay.....

THE severe laws against "green goods" sharpers in New York and New Jersey have made Philadelphia, Pa., their headquarters of late, though they still frequently bring on their dupes to New York to finish the job. The Pennsylvanians now propose to get rid of the pests by the passage of a law like that passed in New Jersey last year. It provides that if any correspondence—letter or otherwise—be found on a suspected offender, it will stand for *prima-facie* evidence, and on conviction the punishment is not to be less than one year in prison, or more than five years, and not less than $100 or more than $2,000 fine, or both fine and imprisonment. It is expected the bill will pass soon.....

JUST as many dairymen and other cow-owners cannot tell, with a reasonable degree of certainty, which of their cows are sources of profit, and which of loss, so many farmers cannot certainly tell whether they gain or lose by this or that crop. Would it not pay to pay a little more attention to this matter? Might it not be as wise to cull one's crops as to cull one's cows.....

LAST year it cost 26 cents to produce and market a bushel of oats in Michigan, and 19 cents to produce and market a bushel of corn .....

IN talking about the prices of wheat and other farm crops of late, it is wonderful to see how anxious the papers are that the farmer should not "rob the poor." If there is an advance of 40 cents a bushel in wheat to be divided between the speculator, the railroad company, the middleman and the farmer, straightway there is an outcry that the farmer is lining his pockets with the hard-earned wages of the poor, although probably the farmer gets the smallest share of the advance. Why isn't as much solicitude displayed about the margin of profits in other pursuits? How many of those who carp at the farmer's profits, would be willing to work equally hard and invest the same amount of capital for returns so small? .....

WORD FOR WORD.

——O. C. FARMER: "A dog has no business being away from home any more than has a cow or horse."

——JOSEPH HARRIS: "We all know that fermenting manure sometimes gives off a little ammonia; but it should be remembered that one pound of nitrogen in manure, if converted into ammonia, would produce 44,700 cubic inches of pure ammonia gas, and that each inch of gas mixed in the air of a room or barn would be readily detected by a good nose. It requires very little ammonia to make a great smell."

"Can we use manure for a hot-bed without loss of ammonia or other valuable plant food? This question is very satisfactorily answered by an experiment of the late Dr. Voelcker, Chemist to the Royal Agricultural Society of England. Five tons of good stable manure contain over 60 pounds of nitrogen. Dr. Voelcker found that five tons of manure (10,000 pounds) placed in a heap in November, and kept out of doors, exposed to rain till April 30, lost less than half a pound of nitrogen or ammonia. The following are the results:

	When put in heap Nov. 3.	Same heap April 30.
Total weight of Manure.....	10,000 lbs.	7,138 lbs.
Water.....	6,617 "	4,707 "
Soluble Organic Matter.....	248 "	305 "
Soluble Mineral Matter.....	154 "	207 "
Total Organic Matter.....	2,824 "	1,678 "
Total Nitrogen, in heap.....	64.3 "	68.9 "
Nitrogen in Soluble Matter.	14.9 "	21.4 "

The heap lost by fermentation nearly one ton of water, and 1,126 pounds of dry organic matter that was slowly burnt up in the heap, and which would give out about as much heat as half a ton of coal burnt in a stove. This organic matter has no manurial value. There was practically no loss of plant-food. On the other hand, the heap of fermented manure is of more value than the raw manure from which it is produced, because the nitrogen and min ral matter are more soluble and more readily available for plants. There s, therefore, no loss in making a hot-bed."

——GARDEN AND FOREST: "American plant-buyers suffer perhaps more than those of any other country, from exaggerated statements regarding new plants, which too often appear in trade-catalogues, because Americans are, as a rule, more easily misled by glowing advertisements than Europeans, and because in America, trade-catalogues are too often the only sources of information about new plants and horticultural matters generally, with which plant buyers provide themselves."

——PRESBYTERIAN: "A man was once appointed a committee of one to examine his own conduct. Later he reported progress, and asked to have the committee continued as it had found more to do than it expected."

——JOHN WILLCOX before the New Jersey H. S.: "What we want, in my judgment, is a law forbidding, absolutely, under heavy penalties, the killing of harmless, innocent birds I may not see all the facts which lie at the foundation of this subject, but if the gentlemen present feel as deeply as I do, they must feel that it is our duty to memorialize the legislature to enact a law sufficiently strong to cover the whole subject."

——I. J. BLACKWELL: "Unless we try the new things that come up there will be no improvement on the old, and there will be no progress made towards that time when the wilderness shall bloom as the rose, and every man sit under his own vine and fruit tree."

——PROF. P. T. AUSTEN: "Let no man disregard the value of a new truth because *he* cannot see any immediate application for it. Truth is truth, and must always come of value, soon or late. Some one asked the great Faraday what was the use and practical value of a certain remarkable discovery which be made, but which was totally in the realm of pure science. 'What is the use of a baby?' replied Faraday. So do not let us despise a new fact because *we* cannot see its value, for we are at best but too prone to be stupid, as the best of us are ready to confess, and when we see the new fact made of immense importance by the cunning of some other men, let us, when we cry out peevishly, 'Why how simple! We could have done that,' also add manfully, 'If we had but known how to do it!'"

——PROF. SHELTON, OF KANSAS AGRICULTURAL COLLEGE: "We raised at the Station last year, a number of sorghums and several of their near relatives, including the Rural Branching sorghum and African millet. These sorts of cane have the sorghum's ability to resist drought, and give a heavy yield of grain and fodder. Farmers living in the western and southwestern counties of Kansas, ought not to allow other seasons to pass without giving these sorghums a thorough trial. The seed is inexpensive (a bushel, costing $2.50, will plant a dozen acres), while the cultivation given corn or common sorghum is sufficient to make the crop."

——PUCK: "'Almost' is the difference between the conscientious man and the liar."

LIFE: "The fact is that New York State is governed by a lot of rascals and ignoramuses. It is a serious fact, too."

For Seasickness
Use Horsford's Acid Phosphate.

Dr. PRICE, of the White Star S. S. *Germanic*, says: "I have prescribed it in my practice among the passengers traveling to and from Europe, in this steamer, and the result has satisfied me that if taken in time, it will, in a great many cases, prevent seasickness."—*Adv.*

Dyspepsia

Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds, it will cure you.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2¼-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. L. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

$20 FENCE MACHINE FOR $10
Freight paid. *Guaranteed.* Hundreds in use. Circulars free. S. M. Garrett, Mansfield, O.

PEERLESS DYES Are the BEST. SOLD BY DRUGGISTS.

Trees, Seeds and Plants.

TREES ROSES GRAPES

We offer the largest and most complete general stock in the U. S., of Fruit & Ornamental Trees, Shrubs, Evergreens, Roses, Pæonies, Hardy Plants, Grape Vines, Small Fruits, etc., including many Novelties. Catalogues giving information indispensable to planters, sent to all regular customers Free; to others: No. 1, Fruits, 10c.; No. 2, Ornamental Trees, &c., illustrated, 15c.; No. 3, Strawberries, No. 4, Wholesale, No. 5, Roses, *Free.*

ELLWANGER & BARRY,
MOUNT HOPE NURSERIES, | ROCHESTER, New York.

OVER **6,000,000** people believe that it pays best to buy Seeds of the largest and most reliable house, and they use

Ferry's Seeds

Earliest Cauliflower in existence.

D. M. FERRY & CO. are acknowledged to be the *Largest Seedsmen* in the world. D. M. FERRY & Co's Illustrated, Descriptive and Priced **SEED ANNUAL** For 1889 Will be mailed FREE to all applicants, and to last year's customers without ordering it. *Invaluable to all.* Every person using Garden, Field or Flower Seeds should send for it. Address

D. M. FERRY & CO., Detroit, Mich.

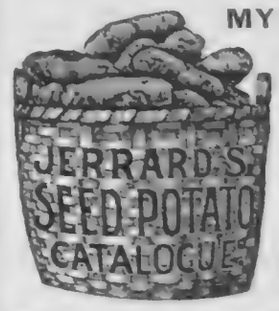
BIG BUCKEYE FIELD CORN.

GOLD COIN SWEET CORN.

DON'T BUY YOUR SMALL FRUIT PLANTS, TREES or seeds until you get our Catalogue. It will interest you. Send for one Free.
COE & CONVERSE, Fort Atkinson, Wis.

EVERY 5th PERSON
who sends for my **500 Varieties** will receive a **new** variety by simply naming this paper. **Catalogue** of over **of POTATOES FREE**
G. D. HOWE, North Hadley, Mass.

FREE
Prettiest Illustrated SEED-CATALOGUE ever printed. Cheapest & best SEEDS grown. *Gardeners trade a specialty. Packets only* 3c. Cheap as dirt by oz. & lb. 100 000 pkts new extras free.
R. H. SHUMWAY, Rockford Ill.



MY **Seed Potato CATALOGUE**
Describes the choicest SEED POTATOES and the earliest Seeds, grown in the Cold North-East. It tells of the wonderfully early **MINISTER** and names special *Low Freights* East and West. It tells how to raise potatoes. *Sent free.*
GEORGE W. P. JERRARD,
CARIBOU, MAINE.

CHOICE SEED POTATOES
OF MY OWN GROWING.
Send for Descriptive Catalogue of 13 NEW and STANDARD VARIETIES, mailed free.
ALLEN WILSON, Suffield, Conn.

FOR SALE CHEAP!
3 and 4-Year-Old Apple Trees. List of Varieties and prices on application.
GRAY BROTHERS, New Canaan, Conn.

VEGETABLE PLANTS—Standard Sorts, at reliable rates. Send for Price List.
M. GARRAHAN, Kingston, Pa.

JESSIE only $2 per 1,000. Crescent, $1; all varieties; prices *free.* SLAYMAKER & SON, Dover, Del.

600 ACRES. 13 GREENHOUSES.
TREES AND PLANTS
We offer for the Spring trade a large and fine stock of every description of FRUIT and Ornamental TREES, Shrubs, Roses, Vines, SMALL FRUITS, Hedge Plants, Fruit Tree Seedlings and Forest Tree Seedlings. Priced Catalogue, Spring of 1889, mailed free. *Established* 1852.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, MARCH 9, 1889.

NOTICE TO THOSE WHO DESIRE TO ENTER FOR THE R. N.-Y.'S WOMEN'S NATIONAL POTATO CONTEST:

All who desire to enter for the Women's Potato Contest are respectfully requested to send in their names before the 20th inst Full instructions and a list of the contestants will be published at about that date.

THIS number of the R. N.-Y. is a regular Farmers' Institute.

THE RURAL NEW-YORKER for 1889, will be, as hitherto, invariably, $2.00 a year for single subscriptions, and $1.50 in clubs of five or more.

ONE of our subscribers writes that she thinks the souvenirs should be divided between the East and West. That is also the opinion of the R. N.-Y.

"Are there no farmers and dairymen in embryo to whom a good home, wages, and experience would be a benefit before a personal undertaking? When countrymen all flock citywards they may help the city, but they kill the country. What sort of a physical corporation is that in which the best blood rushes to the heart and stays there?

A. C. C, page 162.

TWELVE different varieties of tomatoes were grown last season upon a poor soil which had not been manured for many years. The soil was given a liberal dressing of a high-grade complete fertilizer. The vines grew thriftily and bore abundantly. What we cannot account for is that all of the tomatoes were of a yellowish red instead of being of various shades of red peculiar to the varieties.

QUITE a noted French dairy authority has recently advanced the theory that milk can be most readily and safely shipped and stored in a frozen state. Experiments in France go to show that frozen milk can be transported with the greatest ease, and that when thawed out, after days or even weeks in a frozen state, it retains all the characteristics of fresh milk. A number of experts attempted to pick out the thawed milk from specimens that had never been frozen. They were unable to do so. The application of the principles of cold storage has about revolutionized the fruit business. Shall we witness a similar revolution in the milk business?

A LARGE advertisement is appearing in many papers which displays a three-column picture of "a view of Fulton Row, Washington Market, New York City," and which offers to send seeds to *any* address trusting to the honesty of the recipient for pay. It is signed "New York Market Gardeners' Association, No. 39 Dey St., New York City." The R. N.-Y. has refused this advertisement simply because of its peculiar character and the fact that a letter-box in the hall was all that a RURAL representative could find as a materialization of the association.

ATTENTION is called to the remarks of J. W. on page 162, in relation to the clover midge. His observations seem to establish the fact that a crop of seed may be secured from Medium clover, by making the first cutting very early. W. L. Devereaux, an observing young entomologist of Western New York, arrived at the same conclusion two or three years ago, by studying the habits of the insect. He advocated making the first cutting early in June, thus enabling the second crop to escape the attacks of the midge. When practical farmers and scientists both arrive at the same conclusions by different methods, the results reached are worthy of the attention of farmers generally. The importance of this subject may be inferred from the fact that many farmers who formerly secured a considerable revenue from cutting the second crop of clover for seed, have been unable, for the past few years, to secure seed for their own sowing. If early cutting is a solution of the problem, it is well worthy of adoption.

THE new "American Meat Company" has already bought nearly 2,000,000 acres of grazing land in Mexico together with large herds of cattle closely resembling Texans. It is likely to make still heavier investments just across the border, in the near future. The import duty on Mexican cattle is 20 per cent. on their value. Animals intended for breeding purposes, for the improvement of our native stock, are alone admitted free. Even a gigantic syndicate will hardly have the impudence to claim that imported Mexican steers or even long-horned cattle-frame-works can be intended for breeding purposes. The prices for Mexican cattle are so low that they will hardly average $10 at the frontier; but even at $10 per head the duty would add $2 to the cost of each—if it is paid. There have been a multitude of complaints of the smuggling of live stock from Mexico into Texas, New Mexico and California, and for some time there has been a great need of greater official vigilance and more customs officers on the frontier. The necessity for both is now considerably greater than ever, especially along that part of the line separating the New Mexican and Mexican property of the syndicate.

UNDER date of February 9th, Sir J. B. Lawes writes the R. N.-Y. as follows: "I am forwarding to you, by book post, our results of potato growing. I know that you have paid much attention to the potato plant and take a great interest in its cultivation. You will be surprised to find how much there is to learn about a plant of this sort. My soil is not at all suited to the potato; it is too heavy and the rainfall is not large enough. You will observe that we are trying to connect the production of starch and sugar with the supply of nitrogen in manure. Sugar in the root crop, and starch in the cereal crop and potato are the greatest products which the agriculture of the world aims at producing. The soil itself is the main source of the nitrogen, but if the soil does not yield enough, or if we require larger crops, we must then have recourse to some compound of nitrogen."

The R. N.-Y. has found by its potato experiments, in a soil that needs all kinds of food, that nitrogen alone does not increase the crop. It has further found that when a liberal supply of nitrogen, phosphoric acid and potash is given, additional nitrogen does not materially increase the crop.

ONE thing is becoming painfully evident in the warfare against wealthy monopolies—the extreme difficulty of checking their career of extortion by legislative enactments. Take the telephone monopoly for instance. Some time back the legislature of Indiana fixed the maximum rate for telephone rent at a reasonable figure; but the company at once met the movement by suspending the service in the Hoosier State altogether. In view of the inconvenience to which the people are thus subjected, the legislature is considering the repeal of the law. Warned by her neighbor's experience, Ohio has rejected a similar bill. A bill before the Illinois legislature fixes the maximum telephone rent at $6 per month. There are two bills before the Missouri legislature, one fixing the rent at $4, and the other at $3 per month. In that State there are 6,000 telephones and the annual rent is now $100 apiece. If either of the bills pass, the telephone company threatens to give Missouri the same treatment that has proved so effective in Indiana. When, a few years ago, Rochester, N. Y. was at war with the same telephone company, and the latter suspended business there altogether, it was forced at once to yield when the authorities and citizens ordered that all telephones should be removed from offices and other buildings, and that all the wires should be promptly taken down. This would entail a large permanent loss. Why doesn't Indiana try what the effect of such a drastic remedy would be?

IN the vicinity of the Rural Farm in New Jersey are to be found all sorts of dairy cows—grade Jerseys, grade Holsteins, grade Short-horns and scrubs. We are making tests of the milk of as many of these cows as we can get. These tests will make very interesting reading when they are completed.

ABOUT OUR ROADS.

A PENNSYLVANIA subscriber sends us the following:

"Give us another Road Special in the spring. You have no idea of the amount of good the last one did. It waked up nearly all the other papers; but they took good care not to give the RURAL any credit. I have seen everything portrayed in the RURAL's cartoon, except the card-playing, and that omission was due to the mishap that no one was thoughtful enough to bring his cards with him. We are getting road machines in nearly all the districts, which means good roads in the near future."

This road question is getting to be a very serious matter. Every discussion of it brings to light some remarkable facts. Take the township in New Jersey in which the writer lives, for example. Every citizen admits that during five months of the year it is impossible to haul 60 per cent. of a full load over our roads. Various "enterprising" people want to have the roads macadamized. The great majority of the voters violently oppose this for two reasons:—1. Because the town cannot afford it. 2. Because the present system gives, in the course of 10 years, a good proportion of the citizens a good chance to draw the road money as salaries for performing the duties of road-master. Investigation shows that during the past 18 years the sum of $45,000 has been expended for the roads in this township. It is estimated that for $30,000 every foot of road in the township could be graded and macadamized. There is a tendency noticed in our State legislature to place the control of roads in the hands of the county or even the State authorities. In many districts, where the worst roads are to be found, such a change would meet with violent opposition, though it is highly probable the roads would be greatly improved. Imagine some skilled road engineer, backed by State or county authority, going into a township where for years the inhabitants have comfortably divided up the road money while "visiting" on the roads. Such an engineer would not meet with the most cheerful reception in the world; but who will deny that he would make the roads better?

ANOTHER GIGANTIC BEEF SYNDICATE.

THE most gigantic association ever formed in this or any other country for the purchase and production of cattle and the sale of beef, has just been organized under the laws of New Mexico, and by the name of the "American Meat Company." The chief projectors and backers of the scheme are magnates of the Standard and Cotton-seed Oil Companies. Stephen Dorsey, Col. Robert Ingersoll, and other New Mexican ranchers who own large herds of cattle and over 50,000 acres of grazing land, have put their property in the pool at from $12 to $20 per acre, and, of course, have made a large profit by the transaction. Osmond Hammond Jr. has entered by pooling his Western Dressed Beef Company with slaughter-houses at Kansas City, 1,000 acres of land, and 12 markets in Baltimore. The concern has purchased 1,828,000 acres of grazing land across the upper Rio Grande, in the State of Chihuahua, Mexico. This vast tract consists entirely of ranches whose owners have become stockholders. Fifty miles from Kansas City, 10,000 acres of grazing land have been purchased.

The idea is to ship their own cattle from their ranches and purchased cattle from other places to this grazing farm, fatten them there, and reship them to Kansas City, where they are to be slaughtered, and from that point the meat is to be distributed in refrigerator cars to Eastern markets. The scheme contemplates the establishment of markets in all the principal Eastern towns and cities and the sale of meat direct to the consumer. The capital of the organization is put at $25,000,000, divided into 250,000 shares at $100 a share. The actual capitalization, however, is only $15,000,000, of which $7,000,000 have been already subscribed at $75. Of the balance of $8,000,000, one-half will soon be put on the market, also at $75 per share, for public investment. The authority to add $10,000,000 more to the capital stock was obtained in view of the possibilities of further growth suggested by the desire expressed by many other ranchmen to come in. The "Big Four" have already a capital of over $50,000,000 in their business, and a lively competition both in the East and West is assured between the new and old concerns. In the West the competition for cattle will probably have a beneficial effect in raising the prices of stock; while in the East the competition for customers is pretty sure to lower the prices of meat to consumers, and consequently still further depress the prices of home-raised stock for the shambles.

BREVITIES.

WE shall be glad to know more about cow-pea hay.

IT appears that the "horse doctors" are still cutting out "hooks" from horses' eyes!

THE Farmers' Club has a rousing attendance this week, and the discussion is a lively one.

Is your experience in the use of different foods for butter the same as that given by Mr. Stewart on page 159?

WE are informed that a farmer in Niagara county, this State, has been indicted for neglecting to destroy peach trees diseased with the yellows. A test case will be made of the matter.

OF good-sized potatoes with a medium number of eyes, cut to two-eye pieces, the R. N.-Y. estimates that eight bushels will plant an acre, if the pieces be dropped every foot in drills three feet apart.

WE can understand why small fruits are not raised on every farm; why celery, cabbage, etc., are not. But there is no reason that occurs to the R. N.-Y. why asparagus should not be raised on every farm—a plot large enough to supply the family with this splendid vegetable. If there is any vegetable that can be raised with less trouble and cost, kindly mention it.

THE Hon. Charles L. Flint, of Boston, Secretary of the Massachusetts Board of Agriculture for 25 years—from 1853 to 1878—died at the age of 65, last Tuesday, at Gilman Ga., to which place he had gone for the benefit of his health. Among his published works are "Manual of Agriculture," "Milch Cows and Dairy Farming," "Grasses and Forage Plants". Esteemed by all in life, Mr. Flint is honored and mourned in death.

THE people of Pennsylvania will soon have an opportunity to vote on the adoption of a prohibitory amendment to the State constitution. A telegram from Reading in that State tells us that at a public meeting of farmers held at Schæfferstown on last Wednesday evening, the drift of the argument was that "the passage of the amendment would lead to bankruptcy among the agricultural classes," and it is proposed to effect an anti-prohibition organization in every township in Lebanon County. Surely that could not have been a representative meeting of farmers? Was it "packed" by village loafers; or was it composed of only the bibulous handful of soil-stirrers with whom "farmin' don't pay" in that neighborhood?

DURING the week the delicious qualities of oleomargarine and its vast superiority to mere butter have been set forth with glowing eloquence before the legislature of Massachusetts. For cleanliness, wholesomeness, purity, freshness, aroma, palatableness and many other virtues, it is claimed that nothing equal to it in the way of fat can be placed before pauper or plutocrat. Why, then, should the champions of such a paragon of conglomerate perfection insist that their favorite should pass to the public under the guise of an inferior article! Let it go on its own merits, and be sold under the nice, appetizing pink color which the dairymen and butter-men demand. Let "oleo" and butter each have a fair show, and give the "dear public" a chance to select one or the other without danger of deception.

THE anti-dressed beef bill has been slaughtered by the Republicans in the Pennsylvania legislature, and "there's music in the air" about Harrisburg. It is well known that the "Big Four" have had a well stocked lobby working earnestly and persuasively with the legislatures of all the States where bills of this kind have been introduced, and it is charged that it cost the Chicago syndicate $60,000 to defeat the measure in Pennsylvania. Some allege that this sum was given to State Chairman Andrews for distribution among bribable Solons, and that he has kept all but $15,000; while others maintain that it was sent to Senator Quay, Commander-in-Chief of the Republican National forces in the late campaign and "boss" of Pennsylvania politics, as a part of the campaign fund, for which thanks were to be returned by defeating legislation hostile to the donors. A committee of the legislature has been appointed to investigate the scandal; but there's little doubt as to the nature of its report.

FARMER'S CLUB.

(*Continued from Page* 162)

GIVE THEM A REST—LIGHT BRAHMAS.

J. S. I., SALEM, MASS.—A great mistake in the management of domestic fowls is constant forcing. All living creatures require certain periods of rest. The trees and all vegetation have their rest. If we wish the rose that has flowered through the past season to flower also in winter, we allow the leaves to drop and place it in the cellar for a few weeks to rest, before forcing it again into active growth. The same should be done with our fowls; after laying through the warm weather they should be allowed, at moulting time, eight weeks rest to renew their strength. This may be accomplished by feeding stimulating food, but not forcing the laying propensities. By this method we get more eggs yearly, and lose fewer birds by exhaustion. Many fowls, especially the Leghorn varieties, often die without any apparent disease, having actually layed themselves to death owing to this artificial mode of treatment. Allow the birds to rest during November and December and you will have healthy fowls and strong chickens the following spring. I class myself among the old breeders of the country, being one of the first to introduce and breed the Light Brahma fowls, which I have bred for upwards of 40 years. The Brahmas of 1845 were quite different from the beautifully pencilled-necked birds of the present day. At that time 50 per cent. were discarded on account of color, form, etc., but by careful breeding we have attained perfection; and uniformity in color, size, form, etc., is established. This breed stands first on the list of Asiatic fowls. While other breeds have been introduced only to be discarded, the Light Brahmas have increased in popularity until now no breed is in such demand. As winter layers and poultry for the market they have no equal.

THE WORDEN AND CONCORD GRAPES.

F. H. V., CLYDE, N. Y.—I think there is considerable misapprehension in regard to the Worden grape. It should not be compared with the Concord as taking its place, but as supplementary to it. Were I to plant a vineyard for market purposes I would plant both. With me, during the past unfavorable season, the Worden ripened perfectly; the Concord did not. The Worden is sweet and good as soon as black, while the Concord must hang several days to be at its best. On the other hand, the Worden is at its best but a short time, losing its flavor rapidly after ripening, while the Concord may be kept in good condition well into the winter. The berry of the Worden is larger than that of the Concord, but I do not think that, on an average, the clusters are larger, or the vines more vigorous. The Worden suffered considerably in reputation when first introduced, by unscrupulous parties buying Concord vines at low figures and selling them for genuine Wordens, some leading growers being in this way deceived for a time.

GOOD COWS, GOOD BUTTER, GOOD PROFITS.

H. C. M., FAIRFIELD CO., CONN.—Since giving, on page 90, a statement of my dairy record for 1888, I have read Mr. Pratt's statement, which makes a very good showing; but I think I am somewhat ahead of him. I have no way of estimating the milk, cream and butter consumed in the family, as I use a Cooley creamer, and whatever milk is wanted for the family is saved out of each milking. There is no limitation as to the quantity. My wife uses nothing but new milk for all her cooking purposes. When she wants cream she goes and gets it without thinking whether butter is selling for 20 cents or for 40 cents per pound. If a farmer who produces good things on his farm cannot consume all he wants of them, what is the use of having a farm? That is my wife's opinion, and mine too. As to butter, we use I think about four pounds a week. At any rate we have used at that rate for the last three weeks. I could not say how many pounds I have sold, as I merely kept an account of the cash as the butter was disposed of. I have sold $133 worth of pork and pigs, but it would be very unfair to give the credit of it all to the cows, as besides a good many pounds of skimmed milk fed, it took a great deal of coarse stuff to make that pork. I have also raised three calves in the year. I think Mr. Pratt's estimate of the value of skimmed milk too high. As to his fears of milk fever, he need not have any. I have had 15 years' experience in keeping cows, and I have never had a case; but I have seen plenty of it around me. All the precaution I take against it, is not to let the cows get too fleshy in the latter end of their milking period. When they are dry, if they are inclined to fatten up I give them short pasture and plenty of fresh water, and all the shade from the sun they want, and they come in during July, August and September without any trouble. After calving I do not feed anything in the line of mill-feed for seven days. If pasture is good, it is sufficient; if not, I piece out with drilled corn, waste vegetables from the garden, etc. It is better to feed too little than too much through this period; but one should see that his cows have all the pure water they want.

MORE ABOUT LIME.

G. S. S., MIDDLEBURGH, PA.—In a late RURAL I saw another article on liming land. I feel like adding my experience for the benefit of those who contemplate the use of lime. This calcareous formation is natural to this county. It extends almost its entire length from east to west. In fact, over the whole county it crops out. We also have the red shale and light shale, or light gravelly soil. At the east end of our small town there are 12 or more kilns; moreover, some farmers have lots on which they erect stacks and burn lime. A number of years ago these were the most of the time in full blast; while at present there are only a few in the business and those only on half time. On our limestone land the effects of the first and second applications are very marked, while those of the third and so on can hardly be noticed. It has a tendency to make the land hard. In drought it bakes so hard that all clover and young grass will die out. About eight years ago I had ten acres which seemed entirely exhausted of all fertility. Neighboring farmers said it should be limed, and 100 bushels were applied per acre on sod. In the spring clover was sown, but it would not catch. I turned the stubble again in hopes it would do better; but the result was the same. For the third time (I am ashamed to say it) it was stubbled. This time it got a light dressing of fine barn-yard manure, with 200 pounds of good fertilizer and this brought it out all right. I got a heavy crop of grass on it afterwards. Since then I have tried 70 bushels on oat stubble on the plowed ground, and the effects were the same. The advocates of lime will, no doubt, say the quantity applied was too great, or that poor judgment was used. I will admit all this; but even those who apply it on a clover sod begin to see that its use will eventually make their land hard and unproductive. Some farmers are still using it, and raise from 12 to 15 bushels of wheat per acre. Last season I averaged 25 bushels of wheat per acre, with barnyard manure and a light dressing of fertilizers. On our light soils the effects of lime are about the same. One sees no manure piles, every bit of grain is sold and then the farmers haul out lime thinking it a manure. But every such farmer will sooner or later see his folly.

R. A. S., JOSEPH, OREGON.—Almost every one advises us to use corn-cobs for smoking meat. If people will try green willow for this purpose they will never use anything else. I learned this from an old trapper and hunter. The willow gives meat the most delicious flavor. Green cotton-wood is superior to corn-cobs any time.

W. C. M., BLACKSTONE, MASS.—Quite frequently I wish to refer to some article which I have read in the RURAL, so I have taken a small blank-book and started a simple alphabetical index; and now each week as I read the RURAL, I index such matter as I may need for reference. It takes no time to speak of, and if one wishes to find something he has read, it will save considerable time and trouble.

A. J. P., JOHNSTOWN, N. Y.—Reading Bucephalus Brown's Ideas on poultry in a late RURAL set me thinking whether poultry pays. I have 251 fowls—108 one-year-olds and 143 pullets. In January we got 75¼ dozens of eggs. There is no colder month in the year and during it we do not expect many eggs. A part of my pullets were hatched late and are not yet old enough to lay. The eggs last January averaged 27 cents per dozen.

A. H. S., MELROSE, N. Y.—Here is my experience with the RURAL'S trench system: I planted one bushel of Pearl of Savoy, cut to two pieces with three eyes each, about 15 inches apart, and got 30 bushels of as fine potatoes as I ever saw. I used 100 pounds of bone superphosphate. The soil was a rich sandy loam. I am thoroughly satisfied that it is the only right way to plant potatoes to get a big result. I am going to try it on a larger scale this year. Success to the RURAL!

H. R., BROOKFIELD, MASS.—Mr. Brown says that for poultry on the farm no special feeding whatever is needed; that with plenty of natural food, clean water and comfortable quarters they will lay all the eggs they could lay under any conditions. I would like to ask him what this natural food is, and how it differs from yarded poultry feed in the winter. I don't know what advantage the farmer has over the fancier for making hens lay. Perhaps he can tell us?

E. K. M., REXFORD, KAN.—I have of late noticed several reports in the press which, if true, would indicate that peanut culture in this State may become a very profitable industry. Will those who have "raised 40 bushels to the acre" please report their method of culture and handling to the RURAL. I have resided in the State the past four years and have raised a small quantity of peanuts for my own use each year, but have never tried to raise them on a large scale. They grow nicely, but seldom mature more than three-fourths of the nuts.

J. N., OUTAGARNIE CO., WIS.—Last year I undertook to raise about two acres of pop-corn. It was planted about the end of May, came up well, was cultivated and hoed and made a fine growth. I felt sure of at least 50 bushels of ears to the acre; but the early frost caught it before it was ripe, and instead of getting 100 bushels of fine pop-corn I got about 30 that was fit for market. First-class, nice pop-corn is worth two to three cents per pound in the ear. A bushel of ears thoroughly dried will weigh about 40 pounds. It requires to be thoroughly cured I shall try again next season and will plant about two weeks earlier.

W. A. M., ERIE, VA.—I shall stick to the old theory of feeding only twice in 24 hours until I can see better results than I ever have seen by feeding three or more times. In all instances regularity in the hours of feeding should be carefully observed and the quantity must be what the animal will consume with a relish. When the amount fed is greater than the animal consumes, then there is unavoidably a waste, for when food is once breathed on and mussed over the creatures must get very hungry before they will eat that left from the previous feeding. Clean mangers are always a great stimulus to a hearty relish of whatever is fed. A variation in substances fed gives relish as well as thrift.

R. G. CHASE & Co., GENEVA, N. Y.—We have just received the following note from Mr. Hyatt, of Yates County, N. Y.:

"I have just seen in the RURAL a cut of the Geneva which is a disgrace to the grape. I could have sent you half a dozen bunches far better. But I want to speak of its keeping qualities, particularly. I kept some till about New Year's, and they not only improved, but *changed* in quality greatly for the better. And while I left some of them until they began to shrivel, not a berry would drop or shake from the stem. All were delighted with the fine flavor they acquired by long keeping.

R. N.-Y. The bunch was drawn and published simply because the specimen was an average of the several bunches sent to us. It has not yet fruited at the Rural Grounds.

G. D. N., NEW MARKET, ALA.—I use what is called cotton motes (the waste in ginning) as a covering to preserve Irish and sweet potatoes through the winter. When dug I put them up in conical mounds under a shelter open on the Southwest and East, and cover them all over with cotton motes to a depth of one or two inches. This covering will protect them from our severest winters. Frequently the chickens scratch about the mounds and expose the tubers, but no frost injures them. Perhaps there is something in the fibre which prevents damage. I have put up all kinds of fruit in open jars, heating the fruit as if going to can it; but after filling the jars to the top I simply cover them with bats of carded cotton wool, and they have kept as fresh for months as if they had been sealed in cans. According to Prof. Tindley even microscopical germs, microbes, etc., cannot pass through cotton.

"W.," TYRONE, PA.—The RURAL says (P. 71, 2d. col.) "Don't use a hedge of any kind nowadays, as a cattle fence." But what is the matter with a hedge that merely masks a real fence of three or four barbed wires? Such a hedge need not be thorny, or strong, or even. Its purpose is to show animals their dead-line plainly, and to shelter and beautify the field. If in pasture land only such plants as cattle dislike should be used, such as barberry, briar roses, purple osier. They won't touch Japan quince or privet unless famished. Privet is so nearly evergreen that it would come very near meeting Snowdrop's wishes, especially if some deutzias, mock oranges, shrub honeysuckles, altheas are set in it here and there. Spiræas would aid its floral beauty, but they widen the hedgerow by their habit of stooling. (P. 73, 3d col.) Another reason for recommending the cherry for roadside planting is that boys can't pelt off the fruit, and if they climb they risk being caught.

E. W. G., WAYNESBORO, PA.—I asked, 1. What kind of stock is used for the Kilmarnock Willow? 2. Would it be advisable to plant the Delaware Red Winter apple extensively? 3. Can the weeping maple be grafted on any other sorts? To those inquiries the RURAL answered: "1 The Goat Willow—Salix caprea. 2. There are several Red Winter apples, but we do not know of the Delaware Red Winter. 3. We do not know of any weeping maple. Kindly tell us the specific name."

The Delaware Red Winter apple is described in the catalogues of Lovett, Phoenix, and other nurserymen. Ellwanger & Barry advertised the weeping maple. A neighbor of mine purchased two trees, but their habit is not very "weeping" or pendulous. I can't find the varietal name.

R. N.-Y.—The Delaware Red Winter referred to is probably the Lawver. There is a maple known as the Palmate Weeping Japan, that may be the kind referred to. This we believe is slow-growing and not very pendulous. The Kilmarnock may be worked on any willow stock, but the Caprea suits it best.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

A GOOD many industrious people think that it looks lazy for a woman to sit down at her work, but what a mistaken idea this is. Most industrious women suffer more from being constantly on their feet than from any other exertion. Actually, we have seen women standing to peel potatoes, when there was no earthly reason why they should not sit down. And they wonder that they feel dragged out! We believe that it is the positive duty of a busy housekeeper to rest all she can, and she ought to sit down when preparing vegetables, wiping dishes, or even ironing. We can imagine a chorus of indignant protests at this last statement; but we know plenty of women who would feel very much better both in health and temper if they tried it. So often what seems to be ill-temper in a woman is merely over-tasked nerves and over-tired body. We don't always think a woman is fretful when she shows care-worn lines in her face; they are often a sign of tender cares and loving work for others. But it is her duty to care for herself while caring for others, and one of the necessities of such care is rest when rest is possible.

OUTINGS IN NEW ENGLAND.

MARY WAGER FISHER.

THAT every loyal American should feel a particular interest in New England and what pertains thereto, is well understood. Although it is not altogether true that on her soil was the cradle of liberty rocked more vigorously than elsewhere, still there is a general sentiment to that effect. It was there that the Pilgrim Fathers and Mothers landed on that bleak December day in 1620, making of the spot a Mecca to which thousands of people turn their steps yearly, and which is indeed to many the most hallowed ground in all the country.

When one is free to enjoy a summer outing as he likes, it is not always easy to define why he chooses a certain locality, or the circumstances that drift him to some place where he least intended to go, so when for three successive summers I have found myself on the rock-bound shore of New England, it has seemed more like a happy fatality that has drawn me to a region so abounding in historical associations, than any prearranged plan. The first summer we planned to spend in the beautiful Chester Valley in Pennsylvania, but we actually spent but one day there. We then directed our steps toward the Atlantic seaboard, tarrying for a time in the old town of Burlington on the Delaware, which is claimed to have been Penn's original site for Philadelphia. James Fennimore Cooper was born there, and so was Admiral Lawrence, and the dwellings which were their birth-places are still standing. It is a pretty town because of the old trees which shade the streets, and there is much of interest of a local character connected with the old families and homesteads a few of them built before the Revolution, and some of them have the added attraction of old-fashioned gardens now so rarely seen in these days of "modern improvements;" but none of these equals in simple and lasting charm the garden walk with flower borders, and vine-wreathed arbors for resting-places arching the walk at intervals. One of the most amusing old things which we saw in Burlington was a doll which was brought over from London in 1760—a family heirloom. Being of wood, it had borne the brunt of hard

usage with marked self-preservation and now in its advanced age sits in a place of honor, clad in silk, to be gazed at by admiring visitors.

From Burlington we went on a hot July day to New York to embark for Boston without any definite idea in what direction we should radiate after reaching the Hub. "We will go to Boston first," decided Anaximander, "It is the center of everywhere in New England and when there, we will decide where to go." Although we had in years gone by been in New England and had traversed Long Island Sound in what are called the Sound steamers, still so much had come in between that it was like a fresh sensation to ride out from the pier in a boat carrying half a hundred passengers, a band of music playing on deck and the watery way for an hour or more lying between the great cities of New York and Brooklyn. As many times as I have made the trip I always feel that the view is most magnificent—the vessels in port, the towers and spires, the great warehouses, the hurrying ferries loaded to the edge with human beings and the Brooklyn Bridge that looks too low for the steamer to pass under without losing her smoke stack; but there proves to be room enough and to spare. Finally the after-glow of the sunset dies away, night has come and although the music of the band continues, it is bed-time. The laddie climbs into his berth and is quickly asleep. But I am a poor sleeper at sea, and the night rolls slowly away in a succession of fog whistles, signal bells and the swash of the waves. Finally at early dawn Newport is reached, or one can go on to Fall River and thence go by rail to Boston.

As a sea-side resort Newport has the advantage of a splendid situation. It is practically at the door both of New York and Boston. Its air is delicious, its villas magnificent, its water views superb, its drives and its bathing all that could reasonably be desired. I once spent a delightful fortnight there, and in many ways it is unsurpassed as a pleasure and health resort. But on this occasion we simply drove about the town to refresh our memories of it. The laddie went into the surf for a bath, and we left at three in the afternoon *via* the Old Colony R. R., for Boston, passing through many "factory" towns and seeing no end of stone walls in stony fields. It is a curious thing that, in a region where there is no end to stone, a stone house is almost never to be seen. The stone fences are picturesque, with vines and brambles trailing over them, and there were many old apple orchards, but the ground had a hard and unyielding look. A curious incident of this ride was furnished by a man in the car, engaged in reading a magazine and who incessantly beat a stick about a foot long between his mouth and the page he was reading. The movements of the stick back and forth were made with perfect regularity. We puzzled our brains quite a little over the performance, but never arrived at any satisfactory solution of it. We reached Boston after a ride of three hours, and after settling ourselves in a hotel and dining, we went out in the evening to stroll about and sit on the Common. As we visited the Common every evening for a week, we came to have a true Bostonian affection for it, and of all the parks I have been in, it is the most get-at-able and enjoyed by the people. It is in the heart of the city. It is full of fine old elms, and there are seats, drinking fountains, an artificial lake in which even dogs can plunge for a bath without fear of the police, and a bank of green whereon ball-players have full swing for their game. Adjoining the Common is the Public Garden in which the people have less liberty. It is more like a parlor with its bric-a-brac of flower parterres, while the Common might fittingly be called a family sitting-room. In the latter is the Soldiers' Monument, surmounted with a statue of Liberty. The inscription on this monument, written by Elliot, President of Harvard University, is a model of its kind. "To the men of Boston who died for their country on land and sea in the war which kept the Union whole, destroyed slavery, and maintained the Constitution,—the grateful city has built this monument that their example may speak to coming generations." In the Public Garden is the Ether Monument—American doctors being especially prominent in the application of anæsthetics—Godman in 1822, Jackson in 1833, Wood and Bache in 1834. Dr. Horace Wells, of Hartford, Conn, a dentist, was the first, I believe, to make a practical experiment in the use of nitrous oxide gas in tooth extraction. He was a brave man and personally underwent the operation of having a tooth pulled out after being rendered insensible by the inhalation of the gas. But being afterwards unfortunate in its use, he abandoned further trial. Soon afterwards Dr. Morton, of Boston, tried the vapor of sulphuric ether in tooth extraction, which marked a great era in surgical operations. But the Ether Monument is more particularly in commemoration of the "discovery of anæsthetics" at the Massachusetts General Hospital in 1846.

ON INVITATIONS.

IN that very delightful corner of the RURAL, called "Chat By The Way," under date of January 5, 1889, the writer says "The most exasperating invitations we receive are those asking us to come 'some time,' which when we have accepted we generally find to mean no time." I do not think I have quoted the words exactly, but I know I have not misstated as to their meaning, because it struck home. I want the fair writer after she has heard my statement to agree, if possible, that there are exceptions to all rules, after which I will willingly concede that it is the exception that proves the rule. I have a way of saying,—only to my very dearest friends, however, "Come and see us at any time to suit your own convenience. 'The latch-string always hangs out.' If I am not at home, make yourself master of my castle (it has seven rooms, small ones,. If you can give me a day's notice I shall take care to be at home, but be sure that when the spirit moves you to come, I shall give you a right royal welcome."

Now the most delightful visits I receive are in response to just such invitations, and I think no one will ever accuse me of meaning "no time," by my "some time." I never invite any one unless I really want him or her, and when any one does come, I never cease to feel grateful for the favor. There are so few people whom I care to visit myself, that I always appreciate the compliment paid me when a friend comes "to supper or to dine."

ALICE CHITTENDEN.

GOLDEN GRAINS.

IT is as true now as it was when Lincoln said it, that you may deceive all the people some of the time, and some of the people all the time, but not all the people all the time....

IT is true that the pleasantest things in the world are pleasant thoughts, and the great art in life is to have as many of them as possible.....

SOUTHEY said that if one would be pungent he must be brief; for it is with words as with sunbeams, the more they are condensed the deeper they burn.....

HOW true was Emerson's conclusion when he said that the best part of health is a fine disposition. Nothing will supply the want of sunshine to peaches, and to make knowledge valuable, you must have the cheerfulness of wisdom.....

THE INDEPENDENT says that mental and moral worth consists not in houses and lands, or in high station, but in the thoughts of mind and in the feelings and affections of the heart. Some rich men in the wordly sense are really very poor in the moral and spiritual sense....

A FUGITIVE paragraph reminds us that anybody can soil the reputation of an individual, however pure and chaste, by uttering a suspicion that his enemies will believe, and his friends never hear of; a puff of the idle wind can shake a million seeds from the thistle and do a world of mischief which the husbandman must labor long to undo. Such are the seeds of the slanderer, so easily sown, so difficult to gather up, and so pernicious in their fruits....

THE SUNDAY SCHOOL TIMES says that one of the meanest modes of lying is by making the truth lie; by saying that which is true as far as it goes, but which intimates that which is utterly false. And while this mode of lying is a favorite mode with the willful slanderer and backbiter, it is not altogether abjured by thoughtless persons who are without malice in its using. It is strictly true, for example, of any woman that "she is no better than she should be." Yet when that truth is uttered concerning any woman of ordinarily good character, it is equivalent to a foul falsehood agianst her.....

EXPLICIT details of truth in a narrative may be given in such a way as to amount to a cruel and baseless lie. If a man were to say of another that he saw him in the surf when a companion was drowning, yet, although he was a strong swimmer, that he never moved a hand to help his drowning companion, it would be equivalent to a charge of cold-blooded heartlessness, if not a practical murder. The concealed fact, however, being that the strong swimmer was just then struggling to save his own child from drowning,—the truth so far as it was told, was made to lie. .....

THERE is a good deal of this lying by truth-telling in social comments on acquaintances and neighbors. It is not enough that we guard our lips lest we speak that which is false. We must also guard minds and hearts, lest we make the very truth to lie by our lack of a spirit of Christian love in all our utterances.

It is said that the great Theodore Parker, when uttering the Lord's Prayer, used to say; "Forgive us our trespasses as we should forgive those who trespass against us." He also prayed; "Lead us from temptation," instead of "Lead us not into temptation."....

WHAT WE DO.—We offer the strongest, cheapest, purest and most wholesome Butter Color in the world, perfectly harmless and every package is warranted to give entire satisfaction or money refunded. Thatcher Mfg. Co., Potsdam, N. Y—*Adv.*

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

IF you are not happy, dear friend, it is because there is something wrong with your stomach, your conscience, or both.

DID you ever see a perfect profile of a face, the full view of which proved to be positively ugly? *Moral*: Take a full view before you judge.

DOMESTIC ECONOMY favors the use of the word *woman* or *gentlewoman* in lieu of the much-used and ill-applied word "lady."

Personally we object to the word "Thanks," as an expression of one's indebtedness. We might as well say "How?" For "How do you do?" or "Good" for "Good night." There is something snobbish about it. If one cannot express his sense of obligation in a full sentence, he had better not say anything.

EXTRACTS FROM SUNDAY EVENING TALKS AT THE RURAL GROUNDS.

SPOKEN WITHOUT NOTES BY A FIFTEEN-YEAR-OLD GIRL.

MY little talk to-night entitled, "OUR AIM IN LIFE," was suggested to my mind by several trifling incidents which have occured in my own life.

About three weeks ago I went to the city, and spent part of the day in papa's office He and I had lunch together and then we started out. I had no idea where we were going; papa said for a little walk. In 10 or 15 minutes we came to Peter Henderson's large seed-house and as papa had a little business to transact we went into Mr. Henderson's private office. He greeted us *very* pleasantly and he and papa at once began to talk about various roses, potatoes, etc., etc. In the meanwhile *I*, of course, had to remain a patient listener, for I could take no part in the conversation. Finally papa stepped into the other office for a moment, and Mr. H. turned to me saying: "This weather must be very pleasant in the country." You can imagine my thoughts as I answered: "Yes, indeed." I wanted to say, "Mr. H. *I don't want to talk about the weather.*" Previously he had been talking of something he supposed I took no interest in, and knew nothing about. He was right, and therefore he changed the subject to that *interesting* (?) and never-failing topic, the weather. Just then papa came back and I was left to my own not very pleasant thoughts. How I wished that I was well posted so that I might join in the conversation, and show that I, too, was interested in roses, potato experiments, etc. But, no, I must wait and, in the meanwhile, keep my aims in mind and remember that being a good listener is next to being a good talker. Several times this desire for knowledge has come over me. I experienced the same feeling on the day of the "potato contest." As you all know, there were persons here from all parts of the United States, men of culture, influence, wealth; literary men and thrifty farmers. After the first excitement was over, I felt like a stray sheep among those men. After making a few common-place remarks, no one cared to talk to me, for I could *interest no-one*. How I longed for an education and experience so that I could talk interestingly to those people. I remember when riding over to the station on the night of that memorable day, to see them off, that Dr. Hexamer, one of the nicest men in the world, talked all the way over to me, telling me of his travels, etc. But I could say nothing but "Yes," "No," "Indeed!" "Is that so?" I like to be among cultured and refined people; it does me good; at such times my short-comings stand out with such prominence that I always feel displeased with myself.

If we would make anything of ourselves in this life, we *must* aim high; keep our aims in mind and live in a way each day that will bring us nearer to that for which we are aiming. When Joshua led the Children of Israel out of the wilderness to conquer the promised land, the Lord was constantly commanding the people to be strong and of good courage, and, as a guide to prevent the people from getting astray while traveling through a strange land, the Ark of the Covenant was carried by priests in front of them that all might see it. In like manner should we keep our aims in mind and be *very* strong and courageous lest we fall backwards down the hill of life toward destruction, and, as in running down hill, the further we go the faster we go, and the harder it is to stop ourselves, so it is in life; the more wicked deeds we do the easier it is to keep on doing them and the harder it is to turn about and struggle upward. But if our aims are *good* and we are *strong enough* we are sure to climb up faster than we fall back and, at last, reach, not the *top*, for no one is *perfect*, but a high point.

When we find fault with our servants and wonder, in a blind way, why they do not take more interest in things and why they are so often careless, thoughtless and cross, if we would put ourselves in their places and consider their ambitions and what their aims in life are, we would wonder *rather* why they were so dutiful and considerate.

One thing more before I close—When we have *fully* made up our minds to *do* anything we should *stick* to it until it is accomplished, and remember that every *failure* weakens our resolution and our character. So let us all strive to walk the path of life with *high aims* and *strong hearts* and the rest we may trust with our Creator.

WOMAN.

"Be a woman! On to duty!
Raise the world from all that's low;
Place high in the social heaven
Virtue's fair and radiant bow,
Lend thy influence to each effort
That shall raise our nature human;
Be not fashion's gilded lady—
Be a brave, whole-souled, true woman!"

WOMAN is the name applied to the female gender of mankind; the opposite of man. To be a *true* woman should be the aim of every girl; yet the word "woman" has almost disappeared, and to call any one by that good, old-fashioned name, is to insult her. They all want to be "ladies" now. A girl who earns her living by standing behind the counter of a store would be indignant if you called her a sales-woman; she is a "*sales-lady.*" The "fore-woman" of the past has also disappeared, and the "fore-lady" has taken her place. This is just as ridiculous as "wash-lady." Not but what there may be many a lady who, by adverse circumstances, is compelled to stand behind a counter in a store, and, simply because she does work for her living in this way, it does not make her one whit less the lady—but this is the exception rather than the rule. "Lady" is from an old Saxon word meaning "loaf-giver," or one who went about giving bread to the hungry. As only rich women were able to do this, the term was gradually applied to one who was rich enough to give alms. Still later it was applied to all females who were able to live without labor. It was a mark of distinction; but now when it has become so broadened in its use and is applied to every female, it has lost its significance.

Webster says a lady is a woman of gentle and refined manners. One can be a woman without being a lady, but certainly one cannot be a lady unless she is a woman. I once heard a minister say from the pulpit, that "the ladies and gentlemen went out and walked by the sea of Gallilee." I don't think, could those men or women of old come back, that they would have felt flattered by being called "ladies and gentlemen."

I would far rather be a woman—a true-hearted, upright woman—than the gayest "lady" in the land. Yet, notwithstanding this, I own that I felt a little cut a short time ago when I heard that I had been referred to as, "a young woman in the 'RURAL' office." Not that I objected to the term "woman," but I felt that a slight was intended. And then, too, I have the temper that usually goes

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

with a red head, so I was aflame in an instant. But, after thinking it over, I concluded that, should a question arise as to which was the lady, I'd run as good a chance of being one as the person who could, unprovoked, slur another.

Girls, be little women! Do not imagine because you may live far out in the country on some lonely farm that it will not matter much. It *will* matter. God watches you in your lonely home just as much as He does those in the crowded city. You may think that you haven't any mission in life; that unless you can do some great thing, there is no use doing anything at all. But it is not so, for "Great things from small beginnings rise;—Sands make the mountains, and trifles, life."

Do your duty always, as nearly as you can. Of course, it becomes awfully tiresome to wash the dishes three times a day—to sweep and dust, to make beds, etc., day in and day out, and sometimes we feel like saying "What's the use?" But if you don't do it maybe mother will have to, and don't you think that mother is tired of it as well as you are? Do you ever think of the years she has spent working from early dawn till late at night? She never says "What's the use?" but goes on patiently, year in and year out. The gray hairs as they come one by one, the wrinkles as they creep into her face, show the care she has endured. Even if you never do a thing that is heard of outside your own village, don't you think you have done good by helping to bear the burdens for mother? Then, too, the sad day may come when those patient hands are folded, those tired eyes closed, and mother's work is done. Will your life be wasted if you are able to take up her work and do as she would have done—care for father and the boys? Or, perhaps, before she goes you may be able to brighten her life a little. Poor, tired mother! Girls, again I say, BE WOMEN!

Before I close let me also whisper a word to the mothers. Do not exact too much from the girls. Remember they *are* girls, and if you want them to be a blessing to you in your old age, be patient with their faults. Do not be forever nagging and scolding them. Remember you were a girl yourself once.

DORA HARVEY VROOMAN.

"Every woman is happy with her work well laid out before her for some few straight-going hours; her occupation is ordinarily so apt to consist chiefly in interruptions."

RAG CARPETS.

As my rag carpets have called forth many highly complimentary remarks from city as well as country friends, I thought that as the time for coloring and making such carpets is near at hand, I would give directions according to my way: First, don't let the rags accumulate until there are enough to cause disorder and dust for days while tearing and sewing. When a garment that is useful for nothing but carpet rags, has been washed and ironed, I tear it up and sew the pieces together if I can. If I have not the time do the sewing then, I put the rags into a basket I keep for that purpose, and the first time that is not filled, I put into work on my rags, and then when the time comes for making a carpet, they are all ready, and I can hardly tell when the work was accomplished. In tearing the rags, tear them entirely off; *do* not tear and tear back, for if you do, little rough ends will stand up until the carpet is nearly worn out. Tear into narrow strips; for then the carpet will not be so heavy, can be handled more easily, will wear just as well and will look much prettier. Don't use any fulled cloth, as it wears out much faster than cotton. Allow one and one-fourth pound of rags to the yard, and you will probably have some left. I do. The finer the rags the less weight of rags to the yard. Shaded strips of brown, drab, or, in fact, any of the colors are pretty and can be made by removing some of the goods from the dye sooner than the others.

One living near rubber works where rubber tubing is made, can procure the cotton strips after they are done with them very cheap. The strips are from nine to 30 feet long and from four to six inches wide. After a thorough washing they are ready for use. I presume most people are familiar with the coloring of brown, drab, green, blue, and yellow rags, therefore I will not give the recipes unless desired. If the rags for green are made blue first, you will have a blue-green, and if yellow first, a yellow-green. Unless you want a blue-green, color all the rags yellow together that you want for yellow, orange and green; make your orange by dipping the yellow into what remains of the red dye. It is much safer than lime-water, for if the latter is a little too strong it makes the rags tender. For wine color, for five pounds of goods, I use two pounds of camwood. Boil 15 minutes and dip the rags one-half hour; boil again and dip half an hour longer; then darken with blue vitriol, 1½ ounce. If not dark enough, add half an ounce of copperas. For red, I use the "Bright red on Cotton" that was advertised by C. E. Helfer in the RURAL of February 16. It is cheap and beautiful and I consider it a great boon to rag-carpet makers.

Be sure to have your goods wrung out of clear water before putting them into any dye. I use plain brown warp, thinking that shows up all colors better than any other, and it is a kind of which I do not tire so quickly. I buy it already colored. ADELLE BUTTON.

BREAKING THE WILL.

Another mistake formerly made in the rearing of children was the practice of what was called "breaking the will." The outline of the work was this: The young child was allowed to do whatever it pleased (supposing, of course, that it could not be trained by gentleness and firmness) without any effort to govern it until it was three, four or five years old; then, when the fit took them the ignorant, unthinking parents, swayed by the old idea of despotic rule, and a mistaken sense of duty, upon the refusal of the child to do their bidding, fell on it with whippings, shakings and the like until the poor little thing too confused to know exactly what was required of it, narrowly escaped convulsions, and if really obstinate, it either gave up the contest only when its strength was exhausted, or, having worn out the time and patience of the parents, the attempt to break its will was adjourned until some other day.

Many children of originally sound minds in healthy bodies came out of such contests with their wills broken indeed, but with shattered nerves, and a vacillating purpose. Many lost in their ill-advised struggles the energy, which well directed, would have carried them triumphantly over the ills of life. It was then often said of a child who had disagreeable manners, that its will had never been broken, as if it had missed one of the great blessings of life. Fatal delusion of parents who stoically desired to do their duty by their children. The high spirit which needs only drilling to be a blessing, is ruined if broken. The intelligent horseman deals more wisely with the colt he wishes to train to drive in harness.

It is obvious, however, that this mistaken severity of our elders cannot be charged against the present generation of parents. Is it not owing to a reaction against the undue haste and despotic severity which was the rule 40 years ago, that now children's wills are hardly checked, to say nothing of being "broken?" Too often they are not even *trained* to habits of obedience and respect for their elders Perhaps in the growing enlightenment on such subjects there may be a change to a middle ground between rigid rule and no rule at all, so that the true development of children may arise from a habit of obedience and order, due to love of what is good, and not to fear of punishment. AUNT RACHEL.

CHARITY'S CROOKED HYACINTH.

Charity moralizes very prettily over the attempt of Mother Nature to correct a bit of carelessness, which probably happened while she was enwrapped in the mystic vail of one of her wonderfully entrancing "domestic reveries." Poor Burt! the unconscious butt of ridicule for a "refined" and gentle sister! I never knew a sister's love; but had I one like Charity, how grateful I should be for the affection that would exhibit me to thousands as altogether unlovely. How my heart would thrill with brotherly love when I read of the numberless tokens of sisterly regard which have emanated from her ready pen! How pleased I should be to know that "culchah" regarded my father and myself as having "no more brains than so many calves!"

Burt *may* be "the crooked hyacinth"; but Charity should know that the bulb was good until her carelessness placed it in an unnatural position, and even then Nature had done much to repair that fault. So with Burt; it seems that he is rude, etc., etc. Naturally, he is good and kind, and "means well, but"—ah! that "but." What a convenient peg upon which to hang uncharitable criticism, together with a goodly amount of self-esteem. Placed unnaturally by the superior "refinement" of his long-suffering sister, the good in him will take its natural course, and we will see it developing under adverse circumstances into a nearly straight plant, and when the time of maturity arrives, we shall probably behold it expanding into a white hyacinthine bloom very like that intended by its Creator.

Charity may make herself easy on one score, and that is; no one will ever take her for a hyacinth, either straight or crooked. Two years ago I planted some African marigolds. When in bloom the flowers were a beautiful shade of yellow, and of a good form. One day I pulled a few b ossoms, but I soon threw them away. Pretty to look at, but, faugh!—what an odor! Charity's a marigold, not a hyacinth. A MAN.

TWO GOOD RECIPES.

At a recent dinner the company being especially pleased with the two principal dishes—rabbit pie and snow-flake cake—I give the recipes, hoping thereby to benefit some housekeeper who may be puzzled about what to cook or how to cook it. I would add that veal, as well as chicken, makes an excellent pie of this sort, omitting only the soaking and parboiling required in cooking rabbit. For the pie:—After the rabbit is nicely dressed, joint and put it to soak in cold water so as to cover it well, adding a handful of salt. Next morning wash the meat in clear water, put in a kettle with cold water to cover, adding a scant tea-spoonful of saleratus. Let it come to a boil, then throw away the water, wash the meat and kettle, replace the meat, cover with cold water, adding a table spoonful of butter, some salt and a good dust of pepper. Cook till tender, keeping it covered with water. When done, remove the meat, add more water if necessary, and thicken the broth with a table-spoonful or so of flour stirred smooth in a little cold water, adding more salt if necessary. Have ready a crust made of wheat flour and one cup of thick sour cream, two cups of sour butter-milk, a tea-spoonful of salt, a heaping tea-spoonful of saleratus dissolved in a little warm water. If butter be used for shortening instead of cream, one-fourth of a pound to a quart of butter milk will be about the right proportion. Mix as for biscuit, roll out about half the crust and with it line a buttered four-quart pan, put the meat in, having first cut it in suitable pieces; fill the pan perhaps one-third full of the broth, adding a good lump of butter and another dust of pepper. Roll the remaining crust to cover the pan, slashing it in the center to allow the steam to escape. Pinch the edges together and bake in a moderately hot oven till done. The remaining gravy, of which there should be at least a bowlful, should receive a lump of butter and be reserved to fill the pan when the pie is baked (using a tunnel to do so). Serve hot.

SNOW-FLAKE CAKE.

Cream together two cupfuls of sugar and six ounces of butter; beat in the beaten yelks of two eggs: add one cup of sweet milk, and beat in three cups (scant) of sifted flour, to which have been added two heaping tea-spoonfuls of baking powder. Last of all, add a tea-spoonful of lemon extract and the well beaten whites of two eggs; beat well and bake in a deep basin well buttered and the bottom lined with buttered paper—white, or the light brown wrapping paper will do. When the cake is done and partly cool, cover it with a frosting made in the proportion of five table-spoonfuls of granulated sugar to the white of one medium-sized egg, adding the sugar, spoonful by spoonful, to the stiffly beaten white of egg; and, after frosting, immediately sprinkle thickly with desiccated cocoanut, and set the cake in the open oven a few minutes to set the frosting. Keep well covered in the cellar till used. GLADDYS WAYNE.

"Nothing's 'catching' that you haven't got the seeds of in your own constitution."

News of the Week.

HOME NEWS.

SATURDAY, March 2, 1889.

THE train bearing President-elect Harrison to Washington, left Indianapolis at 3 19 on Monday afternoon. There were various brief stops along the route, and at several places Gen. Harrison made short speeches. All along, his passage attracted large crowds and excited much enthusiasm. The party arrived at their temporary residence, the Arlington Hotel, Washington on Tuesday afternoon. President and Mrs. Cleveland entertained President-elect and Mrs. Harrison at a dinner in the White House on Wednesday night. Gen. Harrison has been crowded with visitors—friends, acquaintances, curiosity-hunters and office-seekers—during the week. Great preparations have been made for his inauguration next Monday. Military, political and other organizations from all parts of the country will be largely represented. Immense crowds are teeming to Washington from all points of the compass, and the spectacle promises to be the largest and finest thing of the kind ever witnessed on this Western Continent!..... J. W. Arkell, chief owner of the New York comic illustrated paper "The Judge" has just bought Frank Leslie's Illustrated Weekly Newspaper, paying $300,000 for the English, and $100,000 for the German edition. It will come under his management on May 1..... Dr. G W. Bliss, physician-in-chief during the last 80 days of President Garfield's suffering, died at Washington the other day aged 64.... James Russell Lowell has just passed his 70th birthday..... The United States Government pays $900 000 a year for its weather service—nearly 12 times as much as any European Government..... .... Rumor says that the English Government realizing the importance of having at Washington a representative thoroughly posted in North America affairs, has offered the post of British Minister to succeed Lord "Burchard" Sackville, to Sir John Macdonald, the Canadian Premier. This would be a capital appointment. If accepted, doubtless Sir Charles Tupper would assume the leadership of the Dominion Parliament.....A bill has been read the first time in the Canadian Parliament providing for the extradition of boodlers and other criminals whose crimes are not covered by the present list of extraditable offences—only seven offences on the list now. Canada is getting tired of being the receptacle of the moral dregs of this country and Mexico..... There is a strong movement in many parts of the country for the introduction into Congress and the passage there of a salutary national bankruptcy bill. At present bankrupt laws are exclusively matters of State legislation.. .....The widow of the late Richard A. Proctor, the astronomer, who is now living in Florida, has been granted a life pension of $500 a year from Queen Victoria's civil list, as a mark of consideration for her husband's great services to science and education.....

What We Sing.

"Arma Virumque Cano," said Virgil; but in a more practical vein, "We sing the virtues of Compound Oxygen."

In these instances we sing by proxy: our patients are the proxies:

PORTAGE, Wis., January 30, 1888.
"My wife has been taking your compound Oxygen for over two years for consumption and has derived much benefit from it. In fact I think she would have died long ago but for it.
H. D. JAMES.

WALLA WALLA, W. TER., April 9, '88.
I have used your Compound Oxygen treatment. My lungs hold double the amount of air they did at the time I first tried it. I know your agent is all you claim of it
N. K. GABRIEL.

SUMTER, S C., March 24, 1888.
"I believe I owe my life to your treatment.
CHAS. L. WITHERSPOON.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery St., San Francisco, Cal.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, March 2, 1889.

THE fight against the Chicago dressed meat trade was started in the Delaware legislature last Monday by the introduction of a bill requiring the inspection of meat on the hoof under penalty of $50, unless such meat be from cattle, swine, etc., raised or fattened by Delaware farmers..... The Ohio Senate has given a black-eye to the bill requiring the official inspection, at the place of slaughter, of all animals furnishing human food within the State..... .The Missouri legislature has adopted a resolution denouncing the Big Four dressed meat monoply, and appointing a joint committee to investigate the best means to knock out the hateful "combine"..... The last day for the entry of cattle, sheep and swine at the great Paris International Exposition has been postponed till April 1.... A petition circulated by Canadian pork packers and signed by 2,000 farmers was presented to the Minister of Customs at Ottawa, Ont., this week. It sets forth that the exclusion of the American hog products will revive the Canadian industry. A government supporter says their representation will be successful. ....There's a chance for a botanist in the Department of Agriculture. Salary $1,800 a year; examination at Washington on March 2. March 12, is the time and St. Louis the place for holding the great inter-State conference to investigate the beef, pork and mutton "combine." The convention will be composed of joint committees of two Senators and five Representatives from the legislatures of Kansas, Nebraska, Missouri, Ohio, Indiana, Illinois, Wisconsin, Michigan, Minnesota, Arkansas, Texas, Colorado, New Mexico, Arizona and Wyoming.....Arrangements are being made for holding a convention of siloists at Cleveland, Ohio, on March 6 and 7. Secretary Bonham, of the Ohio State Board of Agriculture, Prof. Weber, State Chemist, Chas. E. Thorne, Director of the Ohio Experiment Station, John Gould, the silo champion, and other prominent men will deliver addresses. The railroads leading into Cleveland have granted reduced rates to all members of the convention, who will pay full fare going and one-third returning.....

The Kodak.

PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be re-loaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker.

The Eastman Dry Plate and Film Co.

ROCHESTER, N. Y.

Splendid Location. Good Salesmen. Prompt Returns. Reference—Sixth National Bank.

CONTINUED VICTORIES.

THE COOLEY CREAMER

AGAIN PROVES ITS

SUPERIORITY OVER EVERY OTHER APPARATUS

AS A CREAM RAISER AND SEPARATOR.

The **ANALYSIS** of the **SKIMMED MILK** at the Granite State Dairymen's Association's Annual Meeting, Jan. 8th-10th, shows that the **COOLEY CREAMER** got the cream from the milk the most thoroughly, the next nearest competitor had 12⅛ per cent. more butter fat left in the skimmed milk. The **CENTRIFUGAL SEPARATOR** had 32⅓ per cent. more butter fat left in the skimmed milk, proving conclusively that the **COOLEY CREAMER** is the best **Cream Raiser** or **Separator.**

This agrees with test made by the committee at Amherst, Mass. Creamery in Oct., 1882, when the skimmed milk from the **COOLEY CREAMER** analyzed by **Prof. Goessmann** of MASS. AGRICULTURAL COLLEGE showed that the **COOLEY SUBMERGED CREAMER** was the best **Cream Raiser** or **Separator.**

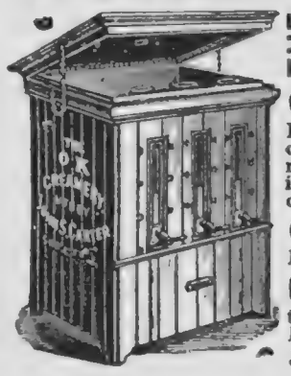
Also with **Prof. Short,** of WISCONSIN AGRICULTURAL COLLEGE, who tells the Farmers of his state: **"Submerged setting of milk is preferable to any other system;** as, if the milk is submerged promptly as soon as drawn from the cow, and the water kept cold, it produces more cream than by any other process, and prevents contamination by any impurities in the atmosphere."

The above confirm all public tests.

The **COOLEY CREAMER** always shows that it extracts the cream from the milk **more thoroughly** than any other apparatus, and consequently makes the most butter. **SEND FOR CIRCULARS GIVING FULL PARTICULARS.**

VT. FARM MACHINE CO., Bellows Falls, Vt.

PERFECTION IN BUTTER MAKING.



THE **O. K.** OUTFIT EXCELS THEM ALL.

O. K. CREAMERY Has the largest cooling surface, takes less cooling material, less labor, and gives best results. All cream raised between milkings. Skimming glass whole depth of can, **showing condition of milk** without touching creamery.

O. K. CHURN Has improvements over the best. Easy to clean, **easy to operate.** Made of White Oak. **Cover Castings will not break.**

O. K. BUTTER WORKER Made on scientific principles. Adjustable bed. Preserves the grain of the butter. **Solid wood rollers. THE MOST PERFECT Butter Worker** ever put on the market.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD.

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

MISS MARY was evidently the speaker of the choir. To give the minister some idea of their musical ability she brought out a well-worn copy of "Gospel Hymns," with the assurance that they could "sing all the tunes betwixt the leds of that book." She added that she sang the "air" while Miss Lucy sang the "counter."

The Parson looked dismally at the little book, for, like most ministers of his class, he had a sort of mild horror of the ringing tunes in that remarkable publication.

"As we have music of our own, I have never used the book you mention," he said slowly.

"But we're agoin' ter sing 'em today," said Miss Mary with an emphasis that left other discussion out of the question.

Miss Mary quickly made herself mistress of the situation. She walked about the room inspecting the decorations, her crutch beating a spiteful accompaniment to her sharp criticism.

"What's this fer?" she asked stopping in front of the green bower.

"I had expected that the choir would select that for their place," said the minister timidly.

"Think I'm gonter set in there?" asked the sharp-tongued "air" quickly, "Not much; I ain't no hen," and she raised her crutch, and with a few well-directed blows utterly demolished the rustic structure.

"We'll set right here, an' when you wants any singin', jest wink at us an' we'll sing fer ye."

Argument was useless, for at this moment Mr. McKelvey, or rather his voice, was heard calling Drum Lake to worship. The minister had hardly time to run to his room and put on his white surplice before the audience arrived.

It was a most punctual congregation. In ten minutes from the time of "McKelvey's holler," the religious portion of Drum Lake had assembled, and the little minister from his seat on the platform looked down with a queer feeling upon his congregation.

Just before him sat the "Chase gals," with Gospel Hymns open all ready for the signal to plunge into melody. Mr. McKelvey as usher, stood just before them, where his coat could show to advantage. On the first two seats sat some half dozen or more women, each one holding a baby. Several small children played about the floor, and one of them had toddled to the front, and grasped Miss Mary's crutch. Mrs. McKelvey sat with the group of women, with her baby on her arm, and an old copy of the service in her hand. Back of the "reserved seats," sat a crowd of men drawn there by curiosity, and the Parson's reputation as a fool. They all wore their every-day clothing, bright-colored shirts, overalls, and heavy boots.

A nod from the minister, he could not bring himself to wink, started the "Chase gals" into song. They sang "Only an Armor-Bearer" in a way that fairly captured the audience, and their voices blended so sweetly that even Mr. Grayling himself forgot the dreary poetry of the song as he listened.

Then the Parson rose to conduct the usual service, but there was nothing exciting about this. Mr. McKelvey was great on the responses. Not being a classical scholar, some of the longer words bothered him somewhat, but by shouting the difficult words in a louder tone than the rest, he got along bravely. The larger part of the audience soon became tired of rising as often as the service demanded, and after a time, Mr. McKelvey was obliged to do all the extra work himself, and he did his duty nobly.

When the Parson paused for the beautiful "As It Was In The Begining"—he was somewhat surprised to hear the choir, in response to his nod, begin, "Pull For The Shore." As the greater part of the congregation joined in with the chorus, the change was not so very bad after all.

The service went slowly on. The Parson had taken out his sermon and signalled the "Chase gals" for another song, when a woman came slowly in at the door, and staggered feebly to one of the rear seats.

She was dressed in a gaudy blue dress, and a wide flashy hat with a drooping white feather—her only clothes, and what a costume for a dying woman! Her hair was caught up behind in a great coil of gold, while her face was as pale as death, and her eyes glittered with a fearful and unnatural light. Little Mamie held her hand, and tried to steady her as she staggered to the seat. A whisper of horrified wonder ran through the congregation. "Sarcy Sal!"

EXECUTORS' SALE.

The farm of the late Wm. W. Stacey in Fayette, Seneca Co., N. Y., 3½ miles from Geneva, N. Y., will be sold at public auction, at the Franklin House, Geneva, N. Y., on Thursday, March 7th, 1889, at two o'clock, P. M.

J. GEO. & D. L. STACEY, Executors.

CHOICE TEXAS LANDS

Rare Chance for Settlers.

The Railroad System of Texas having developed so as to bring within easy access of good interior and seaboard markets the lands granted to the

HOUSTON & TEXAS CENT'L RY. CO.

It has been determined to offer to settlers the

Renowned Agricult'l Lands

Located along the line of the Fort Worth & Denver City R. R., beginning with Wilbarger County, comprising

200,000 ACRES

In farms of 160 acres and upward. These lands were located by the Company among the earliest, with especial care as to soil, timber and water. They are adapted to the growth of cotton, corn, oats, wheat, barley, rye, vegetables, orchards and gardens and the various domestic grasses.

Situated in the elevated and healthy region known as the Southern Panhandle of Texas, they possess a ***genial climate,*** favorable to man and beast, where outdoor work can be carried on the year round, and are in marked contrast with regions of early and late frosts or of destructive "blizzards."

Population is fast pouring in, and local government is already established, with schools, churches, &c.

TERMS OF SALE: One-fifth cash, balance in four equal yearly payments, with interest on deferred payments.

For further information as to these and lands in adjacent counties, apply to

J. S. NAPIER, Vernon, Texas,

(who is prepared to show to purchasers); or to

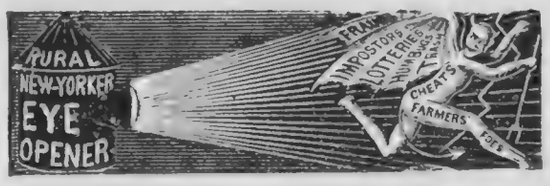
Any boy now can "hoe" potatoes, cabbage, corn or cotton, any depth, or shape, on the Hudson "Bicycle" Cultivator as fast as horses can walk.

T. B. Terry says: **"It is perfect child's play to use it. Beats our Planet, Jrs. four hours to ten—same work."**

Send early orders. **We Warrant Fully.**

R. H. AGRICULTURAL WORKS, Riverhead, N. Y.



CONCERNS CENSURED.—Under this caption the Eye-Opener will, from time to time, give the names of various dubious concerns it has seen denounced in other papers, but which have not been investigated from the Rural Office. Marquand City, Mo., according to several papers, is one of those bogus paper cities that have been often exposed and denounced in this department. It is the offspring of a paper called the Mutual Helper, which purports to be issued in Ohio. This catch-penny affair is $1.50 a year, and every subscriber of this pittance is entitled to receive as a premium a clear deed of a $50 lot in Marquand City, Mo.! Is there any need of saying anything more about the fraudulent nature of this bogus place? If so, surely everybody should be satisfied that it is a swindle, on learning that Bain, the notorious Ohio "chicken swindler" is the editor of the alleged paper.....
A Chicago contemporary finds reason for censuring the method of doing business practiced by the R. W. Sears Watch Company of the Windy City.....Mr. B. Van Raub, of Boerne, Kendall County, Texas, who advertises ponies for sale, opportunities for young men to find employment on his "stock ranch," etc., etc., has for years been denounced by Eastern and Western papers as a humbug and fraud, but he must still find dupes, as he still finds it profitable to go to the expense of advertising pretty extensively in some papers and by circulars through the mails.....

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

REMARRIAGE OF DIVORCED PERSONS.

"A Reader" (no address). If a husband or wife gets a divorce in New York State, does it give the other party a right to remarry in another State? How is it in Illinois?

ANS.—Where a divorce is granted in New York State, the Court in some cases allows the libellee or defendant the right to remarry; but, as a general rule, this is not granted. If, however, the person goes to another State and gets married there, the marriage is valid, whether the party resumes his domicile in New York State or remains elsewhere. If a divorced resident of this city whom the Court has forbidden to remarry, crosses the North river to New Jersey, and there gets married and returns at once to New York, the marriage is valid in this as well as in every other State in the Union, and the person is not liable to any punishment, whereas if the party remarried in New York State he or she would be guilty of contempt of court and subject to punishment, and the marriage would be void. If people are divorced in Illinois, either party may remarry in that or any other State.

ALIEN LAND-HOLDERS IN PENNSYLVANIA.

L. T., Williamsport, Pa. Can an alien buy and hold a farm in this State, even if he has no intention of becoming a citizen?

ANS. In Pennsylvania an alien may purchase and hold real estate not exceeding in quantity 5,000 acres or in net annual income $20,000. The object of the law is to prevent foreigners from holding large bodies of land in the Commonwealth either as landlords or for speculative purposes. An alien, however, may hold any amount of land which he may have acquired by devise or descent.

"X" Burlington, N. J.—In another part of this State a female relative of mine lately died intestate, leaving personal property and a small but valuable farm. 1. Does the husband inherit the personal property? 2. Does he get the farm? 3. If he has only the use of the real estate during his life-time, should he not first be obliged to pay off all his wife's debts including the mortgage, with the personal property or the proceeds thereof?

ANS.—1. When a married woman dies intestate in New Jersey "the husband may demand and have administration of her rights, credits, and other personal estate and may recover and enjoy the same." 2. The husband in case the wife has borne him children, has the common-law right of courtesy in the wife's real estate, which is a life tenure. 3. The husband must pay from the personal property all the lawful debts due by the deceased wife except those secured by mortgage on the real estate, and the person who takes the real estate must take it with the burthens attached to it while in the hands of the deceased, and cannot put these burthens on the personality.

L. M. S., Medina, N. Y.—A marries and through the thrift and energy of himself and his wife manages to accumulate a considerable fortune. Then he dies. His widow marries again. On her death before that of her husband, what claim would the latter have on the property?

ANS.—He would have no interest in the property of the first husband except in the part of it which the widow may have received by bequest or inheritance. After the death of the first husband, his estate would be settled. What portion of his estate would go to his widow would depend on his will, or if he died intestate, on the number and relation of the heirs entitled to share in the property. When the widow dies, if she leaves no will, her second husband, if he survives her, will have no interest in her real estate unless she has borne him children, in which case he would have a life use of it. He would be entitled to one-third of her personal property and even more under certain conditions specified in the laws of descent. All this, of course, applies to this State, as the laws of descent vary considerable in the different States.

M. L. T., Beaver, Utah.—A man died here lately leaving a fine farm and a wife, but no will, children, father, mother, sisters or brothers. Who are his legal heirs?

ANS.—The laws of Utah for succession to the estate of one who dies intestate provide that if the deceased leave a surviving husband or wife, and neither issue, father, mother, brother nor sister, the whole estate shall go to the surviving husband or wife.

DO YOU WANT TO BUY A
FIRST-CLASS JERSEY BULL CALF?
—IF SO, APPLY TO—
MILLER & SIBLEY, Franklin, Pa.

The youngsters are sired by the following Bulls: **Michael Angelo, 10116,** cost $12,500 cash, when six weeks old. Represents the full blood of his dam, **Eurotas,** who made 778 pounds of butter in 341 days on moderate rations, and dropped a living calf 359 days from the beginning of the test. **Ida's Rioter. of St. L., 13656,** inbred son of Ida of St. Lambert. Official butter test, 30 pounds 2⅛ ounces in seven days. **Stoke Pogis 5th. 5987,** sire of six young cows; testing from 14 pounds 1⅛ ounces to 22 pounds 12 ounces of butter in seven days. Full and only living brother of Stoke Pogis 3d, now dead sire of 27 cows, averaging over 20 pounds of butter apiece per week. Almost full brother to Matilda 4th. **Matilda 4th's Son, 20214,** by Ida's Rioter of St. L., 18656, out of Matilda 4th, 12816, who made 73 pounds 1½ ounces of butter for January, the tenth month after calving, and undoubtedly made over 950 pounds of butter during the year. No bull calf sold for less than $100. You cannot afford to use a cheaper one.

Write for what you want. No general catalogue. Mention this paper.

FOR SALE OR EXCHANGE,

The Finest Located and Best Improved 772 ACRE GRASS, GRAIN and STOCK FARM in Buena Vista County, Iowa, bordering on a beautiful lake, 2½ miles from County Seat and Railroad Station. Cuts 500 tons best quality of hay. Fifty thousand dollars have been spent in substantial improvements on the farm during the last ten years and a profitable trade established in Short Horns Clydesdales and Shropshires, many of which have been show-winners of national reputation. The Farm will be sold with or without stock or tools, on easy terms, on account of ill health of owner. Most of the stock is from the most celebrated Herds, Flocks and Studs in England and Scotland, and was selected with great care and regardless of cost. Will exchange for improved city property. CREAMERY SUPPLIES.

A. H. REID, 30th and Market Streets, PHILADELPHIA, PA.

DON'T Censure a friend afraid to nurse a neighbor sick with Small Pox, Typhoid, Scarlet or Yellow Fever, or any other contagious disease.

The fear of death, or, if not this, of being marked for life, or dread of carrying it home, makes the bravest hesitate. A renowned French preparation—**Phénol Sodique,** used as directed—will enable you to give your services to the most violent case of any contagious or infectious diseases without danger of catching it; besides, it will relieve the patient from the burning and devouring fevers.

Don't censure, but try a bottle of PHÉNOL SODIQUE and assure your friends of perfect immunity from harm, and that they may perform the kind office of a nurse to a neighbor, friend or dependent with entire freedom from fear. Price 50 cents, to be had of druggists or from Hance Bros. & White, Proprietors, Philadelphia, who will send descriptive *circulars* and testimonials to all applicants.

ISLAND HOME STOCK FARM.

Savage & Farnum, Importers and Breeders of Percheron and French Coach Horses, Island Home Stock Farm, Grosse Isle, Wayne County, Mich. We offer a very large stud of horses to select from, we guarantee our stock, make prices reasonable, and sell on easy terms. Visitors always welcome. Large catalogue free. Address **Savage & Farnum,** DETROIT, MICH.
Percheron Horses. *French Coach Horses.*

GALBRAITH BROS.,

THE LEADING NATIONAL GARDEN AND FARM WEEKLY OF AMERICA.

SUBSCRIBE FOR THE BEST.

It will please all progressive rural people and all people sensible enough to have rural tastes.

From the N. Y. Times:

"The RURAL NEW-YORKER has done more to promote the true interests of agriculture in the way of experimenting, than all of the experiment stations put together."

From the N. Y. Tribune of Feb. 1, 1888:

"The RURAL NEW-YORKER is a paper which during its nearly 39 years of life has done vastly more for farming than nine-tenths of all the land-grant colleges and experiment stations, whose chief business is underdrainage of taxpayers."

From the N. Y. Sun:

"The RURAL NEW-YORKER is one of the ablest and best papers on rural affairs in all America. It is thoroughly practical in every department, and its constant efforts in the introduction of new seeds, plants, and implements after the most careful tests commend it to the confidence of every tiller of the soil."

From the Farm Journal, Philadelphia, Pa:

"The RURAL NEW-YORKER is the best farm weekly in the world."

From the Inter-Ocean, Chicago, Ill.:

"Readers of the Inter-Ocean do not need to be told that the RURAL NEW-YORKER is one of the best horticultural and farm weeklies published."

From the N. Y. World:

"The RURAL NEW-YORKER is the best agricultural paper in the country."

From Josepn Harris, Moreton Farm, N. Y.:

"The fact is, you are doing more for agricultural and horticultural science than all the experiment stations combined.

Specimen Copies, Posters, Premium Lists free. Price $2.00 a year. In clubs of five or over, $1.50.

Considering the cost of its publication, the R. N. Y. is the cheapest agricultural paper published.

Pomological.

THE WAYLAND PLUM.

OUR friend, T. V. Munson, recently sent us a photograph from which our engraving, Fig. 61, was made. Mr. Munson writes as follows regarding this plum:

"The Wayland plum originated with Prof. H. B. Wayland, Cadiz, Ky., many years ago. It was sent by him to J. S. Downer & Sons, of Todd Co., Ky. who named and disseminated it. In Southwestern Missouri, here in Northern Texas, and near Austin, in Central Texas, it has made a remarkable record for vigor, productiveness, beauty and excellent quality as a late plum, free from injury by the curculio and rot. It ripens about with the Heath Cling peach, and possesses the characteristics, in a large degree, of the Prunus umbellata, as do the Golden Beauty and Kanawha plums, which are equally successful in the South. The Wayland and Golden Beauty begin ripening together; but the former continues longest, and stays on the tree more tenaciously when ripe. The Golden Beauty was found wild on the Colorado river in Western Texas during the late war. Last summer I found a clump of bushes of a character similar to that of the Wayland plum, full of similar fruit, on the Little Wichita river in Clay Co., Texas. I consider them as belonging to the Prunus umbellata species, and not to the Chickasaw, as some do.

We have in the South another species of large-growing, late plums, which is, by some botanists, classed as Prunus Americana; by others as Prunus umbellata; but they agree in description with neither. They are commonly called 'Hog plums.' A dwarf, earlier-ripening plum (Prunus pygma), is also called 'Hog plum.' There is as yet considerable confusion about our native species of Prunus among botanists. They readily hybridize with each other, producing fertile progeny, and occasionally they cross with the peach, producing infertile progeny, so far as known. I have produced a number of such hybrids myself, and all are 'mules.' A large and promising field is open to the experimenter among native and foreign plums; for example, in handling the Wayland and Kelsey; Lone Star or Marianna, and the Ogon, Wild Goose and Botan, or Hattankin, or Satsuma, or Forest Garden and Prunus Simonii. Who will work it? It is rich in promise for the South and West." The engraving below is an exact photographic portrait of the Wayland plum, and is therefore true to nature.

A FRUIT TALK.

AT our house the other day, among other guests, was the well known horticulturist, Mr. Charles Gibbs, of Abbottsford, Province of Quebec, Canada, and I was surprised to find that his Duchess grape and other varieties were, as he said, nearly a week behind ours in ripening qualities. We could not save for our table in late November a bunch of the Concord or Niagara, and all early sorts had separated from the stems. But Salem (red) and Wilder (black) with the big black grape Herbert and the red Agawam, held very well to the stems. All the guests appreciated the Duchess, and the fruit has not lost anything in flavor or appearance. I am sorry we have not enough yet to put them upon the Christmas market, but we are of those who believe in using at home the best we can produce, and so the Duchess is our family grape, and it takes a good many to go around.

Among pears the Flemish Beauty was fair to look at, but the flesh was soft and decayed at the heart. So the best pear we found for our table that day was a russet, firm-fleshed variety called Mount Vernon. It certainly is a pleasant-flavored pear, and the tree bears every year. As we talked of fruit, we discussed some of the grievances to which growers are subject. "Why," exclaimed one, after looking over the markets, "the retailer gets more for weighing the grapes than we do for growing them;" and all felt the unfairness of the wide margin between grower and consumer. My husband related a disagreeable incident in his experience, which was that while going down on the steamer early this season, he saw a number of barrels bearing his full brand, and on inquiry found they were full of wild inferior fruit, all branded as our "Choice Fameuse." Some one had bought up the empty barrels and willfully neglected to scrape off the brand. This was certain to mislead buyers, as the name is well known on the market, and doubtless this trick is often practiced. But what can one do about it?

Prov. Quebec, Canada. ANNIE L. JACK.

STRAWBERRIES.—I fruit in limited quantity some 30 varieties of strawberries. If I were to grow but one variety *for my own use*, it would be Prince of Berries. If limited to four varieties, I would include Crawford, Belmont and Ontario. These are all large kinds that require as rich soil and high cultivation as onions, and plenty of room for each plant. Last season Jessie, Jewell and Mammoth were complete failures in the same plot and under the same conditions in which Crawford, Belmont and Ontario succeeded.

Litchfield Co., Conn. REUBEN C. HART.

THE WAYLAND PLUM. From Nature. Fig. 61.

IMPROVED FRUITS

Has any Real Advance Been Made During the Last Decade?

Correct Judgment Rendered Difficult by the Avalanche of Novelties Introduced Every Season.

PETTED NOVELTIES AND SPECIAL TREATMENT.

THE ALPHA STRAWBERRY FOR EARLIEST; THE MOUNT VERNON FOR LATE; THE BUBACH FOR SIZE AND PRODUCTIVENESS.

Hansell valuable chiefly for earliness; Cuthbert heads the list; Shaffer the best for canning; Golden Queen the best hardy yellow; Tyler and Souhegan essentially the same and scarcely superior to Doolittle; Hilborn has few superiors; Earhart the best ever-bearing. The Lucretia Dewberry valuable for its earliness.

Early Victor, Ulster, Nectar, Moyer, Poughkeepsie Red, Woodruff, Potter receive favorable mention. The best varieties in the South illustrated by Prof. Munson.

PLUMS AND APRICOTS. THE WAYLAND ILLUSTRATED.

The Lawson Pear is handsome and early—that is all. Le Conte and Kieffer in the South.

IDAHO VERY PROMISING.

Improved Varieties of Apples for Various Sections.

FROM PRES. T. T. LYON.

Since a fruit can scarcely be said to have thoroughly established a reputation within much less than 10 years, the specifying of different kinds, together with their valuable qualities, must necessarily be a difficult undertaking, and one respecting which conclusions will be very liable to differ. Such undertaking is rendered more difficult by the avalanche of novelties, each heralded as possessing new and superior qualities; while the difficulty is further increased by the self-deception of very many purchasers, who make pets of such novelties, and, by special treatment, secure results quite above the proper average, and these afford a warrant for higher commendations than those justified by the results of ordinary treatment. Only thus can transient success followed by ultimate failure, in very many cases, be rationally explained.

STRAWBERRIES.—To our earliest fruit, the strawberry, the foregoing remarks apply with peculiar force. After testing and rejecting numerous "earliest" varieties, I have found Alpha the earliest one which has proved reasonably productive, with the needful size and quality, and with satisfactory vigor of plant. I have not yet found its equal in these respects. Arnold's Pride, Bright Ida and Maggie are all seedlings by the late Charles Arnold, of Ontario, Canada, differing in season, though with a family resemblance, vigorous and exceedingly productive. Fruit of large, to very large size, and pleasant flavor; but lacking brilliancy of color. To insure the proper maturity of the crop, rich soil and thorough culture are necessary. Parry, Belmont, and perhaps Gandy are of good size, and superior quality, which render them valuable as family berries, and for this purpose they may be allowed a place among the improvements in question; although, with respect to some of them, there may be room for doubt.

MARKET VARIETIES.—Among these the Crescent holds high rank, but its advent was hardly within the decade. Summit, on strong soils, with liberal treatment, overcomes a lack of vigor, which is its most serious fault. The regular form, uniformly large size, and bright color of the fruit, with satisfactory productiveness, render it one of the most desirable of the later varieties where it has been fully tested; but its success generally is yet to be determined. Mount Vernon, on heavy soils, is one of the most valuable of the late varieties. The plant is vigorous and very productive. Bubach, for vigor and productiveness and for the uniformly large size of the fruit, is not excelled, if even equaled, by any of the older varieties. It seems destined to take rank among the very first upon the market list. Ontario, if it continues as it has begun, seems likely to excel its rival, the well known Sharpless. Jessie, Warfield and Haverland are receiving very high praise; but their performances are yet mainly in the future.

RASPBERRIES.—Hansell may be considered an improvement; but if so, on account of earliness only. Cuthbert, although nearly or quite outside the ten-year limit, heads the list of red varieties, whether for dessert or market. Shaffer, despite its forbidding color, takes precedence as the berry for canning. Golden Queen, on account of its pretentious name, for a time fell under suspicion. It is rapidly winning favor for vigor, productiveness and size. It retains its clear, bright color unusually well when overripe.

BLACK-CAPS.—Tyler and Souhegan are, for all practical purposes, identical. If accepted as an improvement, it must be on account of earliness. They are, however, but slightly earlier than Doolittle, which is, in certain other respects, their superior. Hilborn is apparently attracting less attention than it deserves. It has few superiors in size; while its clear, bright color and high quality are scarcely equaled. Nemaha is much like Gregg. If its equal in productiveness and superior in hardiness as claimed, it will rank among our best market black-caps. Earhart is the best of the everbearing black-caps, none of which are valuable save as producers of fruit out of season.

DEWBERRIES.—Lucretia is the only dewberry that has thus far proved generally successful. It ripens with the early black-caps, quite in advance of most blackberries, and derives its popularity from this fact.

BLACKBERRIES.—There are no recent introductions superior to the older ones, unless Erie or Minnewaski shall prove to be such. This is yet a question for the future.

CURRANTS have received no additions of established value since the advent of the Fay; and the relative value of this can hardly yet be said to be determined.

GOOSEBERRIES present no novelties, save perhaps the Industry, which must as yet be considered of very uncertain value in this climate.

CHERRIES.—Several novelties have received notice through the press and in the catalogues of nurserymen, among which are Olivet, Dougall's Seedling, and the introductions of Prof. Budd; but none of these can be said to have passed beyond the experimental stage.

GRAPES.—Of this fruit the mass of recent varieties is so great, and the status of many of them yet so unsettled, that it is in many cases impossible to determine to what extent, if at all, they are really improvements upon the past. The question of ability to resist cold, together with the various diseases to which the vine is especially subject, further complicates the question, demanding time for a proper solution.

BLACK GRAPES.—Early Victor is acquiring a reputation as one of the best, if not the best, very early black grape. Downing, although not generally introduced, is large both in bunch and berry. This, combined with high quality, promises much for its future. Ulster is, I think, entitled to rank as one of the best in quality. The plant is also satisfactory. Nectar, (heretofore known as Black Delaware,) is of superior quality; although not yet generally planted.

RED GRAPES.—Moyer is of fine appearance and good quality. It is put forward as a hardy and very early variety; but its performances, in these particulars, are yet in the future. Poughkeepsie is very promising, and seems destined to assume a leading position among varieties of its color, should it show itself free from the weaknesses of its rival, the Brighton. Woodruff, on account of its great vigor and hardiness, together with the large size of the fruit, both in bunch and berry, as well as its fair quality and great beauty, is sure to assume a leading position as a red market grape.

WHITE GRAPES.—Jessica comes from Ontario, with a reputation for hardiness and general good qualities. It will doubtless prove valuable, if it shall be found to excel the Lady in either of these important particulars, which is yet uncertain. Empire State and Diamond are both reported to possess exceedingly valuable characteristics, upon the future realization of which their status must depend. It may doubtless be reasonably anticipated that both will take precedence of the Niagara, at least so far as quality is concerned.

APRICOTS.—The recently introduced Russian apricots afford the only probable improvement of this fruit so far as adaptation to our American climate is concerned. They were introduced and for a time propagated from seed. Recently selections from the best of these have been propagated by budding and grafting; but the quality as well as the true value of these selections is yet but imperfectly known.

PLUMS.—Few additions have recently been made to the Domestica species of plums, and these mainly of varieties alleged to be curculio-proof or for other reasons specially desirable for the market.

At the Northwest where the varieties of Domestica generally fail, several valuable selections have been made from the native Americana species, among the more recent of which are Rollingstone and Hawkeye; but I cannot undertake to specify the qualities of each which specially characterize them. Numerous varieties of the Chickasaw are being introduced, but few if any of the more recent ones are yet so well or generally known as to warrant special recommendations. Pissardii is a variety of Myrobolan or Cherry plum, which is valued only as a curious bush or shrub, on account of its dark-purple foliage. Simon, Botan, Agon and others of a recently introduced distinct species from Japan, are put forward with the claim of superiority in certain particulars—a claim yet to be substantiated.

PEACHES.—Of this fruit the only recent varieties that are claimed to be specially valuable are such as from large size, showy appearance or other specially attractive characteristics are found to be profitable for market purposes. Of such almost every peach-growing locality has its special favorites; and, since these, in general, have but a local reputation, a comparison of their valuable qualities is impracticable, and mention of such is therefore omitted.

PEARS.—Of these very few recent introductions have been chronicled, and of such none has been generally disseminated and fruited. Lawson may perhaps come within the prescribed limit; but its chief value would seem to consist in its extreme beauty, which constitutes it a tempting object upon the market. Idaho is a variety originated in the Territory of that name. It has not yet fruited outside of its original locality; but specimens, as grown there, are of very large size, and of unusually high quality for so large a fruit. If equally successful elsewhere, it must prove very valuable.

APPLES.—At the East and North there is little activity in the origination and introduction of new apples, although at the extreme North and West, where the older varieties fail to withstand the severities of the climate, many newer and hardier varieties are being put forward to supply their places. Among these I may mention Scott's Winter, Fameuse Sucré, Decarie, and Canada Baldwin as popular at the Northwest; and at the extreme North, both East and West, I may name, in their order of maturing, the crab seedlings originated by Peter M. Gideon, of Minnesota, and especially commended by him as hardy in that trying climate; viz., Low, August, Florence, Excelsior, September, Cherry Red, Martha, October, Wealthy, Gideon, Peter. To these must be added the extensive importations of Messrs. Budd and Gibb, from Southern Central Russia, which are now being extensively tested, with varying success. Many accidental seedlings originating here, are also being tested, with what degree of success remains to be determined. West of Lake Michigan, and farther South in the newer regions west of the Mississippi also, a distinct class of seedlings is growing up, especially adapted to the climate and soil. Among these I mention McMahon, Wolf River, Pewaukee, Salome and Northwestern Greening as esteemed in Wisconsin, Illinois and Iowa; and Loy, Gano, Mammoth Black Twig, Early Colton, Indian, Red Bellflower, Shackleford, and Forest as valuable from Missouri southward; while Lincoln is said to be almost the sole variety adapted to Southwestern Texas.

Van Buren Co., Mich.

FROM SEC'Y M. CRAWFORD.

GRAPES.—Ten years ago the Delaware was, all things considered, our best grape, and I think it is yet. A skillful grower can bring it to perfection anywhere in the United States; but the great majority will make a failure with it anywhere. The Catawba and Iona are harder to raise, and the Brighton fails in many places. We want a grape as good as the Iona and as easily grown as the Worden or Concord; but I fear it is a long way off. The Jefferson is all right for quality, but not very hardy, and far too late for Northern Ohio. The Poughkeepsie Red and Ulster Prolific have not made a satisfactory growth here. The former is little more than a reproduction of the Delaware. The Lindley is as good as any, but not very hardy. I have seen no black grape as good as the above, but the Potter comes the nearest to it, and it may be grown wherever the Concord flourishes and with as little skill. It is of the Concord class with as large berries, but rather smaller bunches. It is two weeks earlier and as good a grower and with far better foliage. We have no white grape that fills the bill. Niagara and Pocklington are not good enough, Lady Washington is too late, and Jessica is too small and has been condemned at the Rural Grounds. With me it is the most desirable of all white grapes, being a good grower, perfectly hardy, very prolific and very early, while it never drops from the cluster, and is of the most delicious flavor. The Woodruff Red, although discarded at the Rural Grounds, is all and more than was ever claimed for it, on my place. For vigorous growth, hardiness and mildew-resisting foliage, it is all that could be wished. It was never claimed to be very good, but really it is good, and almost free from foxiness. The clusters are not very uniform, but the color is beautiful. It is a favorite with all who ever ate it here. So among grapes, I consider the Potter, Jessica and Woodruff Red, all introduced within ten years, as valuable acquisitions.

BLACKBERRIES.—We have a number of varieties that combine every desirable quality save one. The Agawam and Taylor lack nothing but size, while the Wilson Jr., Lawton, and Erie are deficient only in hardiness. The Early Harvest is very early, but so small and so tender as to be worthless in Northern Ohio or the Northwest. Leaving out the Minnewaski, which I have not fruited, I can see no gain in ten years. During that time, however, the Agawam has been coming to the front, and many have found out that it is perfectly hardy, wonderfully productive, of the very best quality, quite early, larger than the Snyder, and almost as large as the Taylor. I am speaking of the *genuine* Agawam, which is comparatively scarce, although nearly twenty years in the market. The genuine Lucretia has just what we want in an upright grower; but its trailing habit is hard to put up with, and it as hard to kill as the Canada thistle.

CURRANTS.—The Fay currant is an improvement on those that came before it in combining large clusters and large berries. I have seen the Versaillaise as fine as I ever saw the Fay, but the latter has fewer unproductive bushes.

RASPBERRIES.—The Hilborn is better than any black-cap ever before introduced, as it has all desirable qualities in a high degree. It has not a single weak point.

STRAWBERRIES.—There was never any room for improvement in the strawberry except in the directions of size and productiveness. The best berry then is the one that combines these two points together with the natural characteristics of this fruit. The two varieties that do this most satisfactorily are the Bubach and Jessie. These have been introduced within ten years. I might also name the Jewell and Haverland, but the former makes so few runners and needs such high culture, and the latter is so new that I will risk all on the two first named.

Summit County, O.

FROM T. V. MUNSON.

GRAPES.—Early Victor is superior to Ives in earliness and quality. Woodruff is superior in size, hardiness and earliness to other early

red grapes. Poughkeepsie is earlier and finer in quality and cluster than Delaware, as well as a stronger grower. Progress is large in bunch and berry, quite early and in quality and color almost exactly like Catawba. It is a fine grower and less inclined to disease. Lady Washington is excellent for size and beauty of cluster and fine quality. It is a good grower and altogether a magnificent grape in Western Texas. Triumph is of fine size of berry and of cluster. It is very productive, of fine quality and the vine is good. On the whole, it is the best late white grape in Texas. Empire State is praiseworthy for its rich yellow color, good quality and vigor of vine, but it is not prolific enough. Ulster is a fine pale red grape of medium season and rich flavor; but it is not a strong grower. Niagara is the best of the greenish-white grapes, with "foxy" flavor. It is superior in shape and compactness of cluster and a successful market grape. Excelsior is a grand pinkish late red grape with immense clusters and large, meaty berry of the highest flavor. It is successful in the Western part of Texas and will rank high in comparison with Vinifera varieties and is far more successful here. Jefferson is the most successful late, handsome, excellent red grape. Jaeger's No. 70, is a hybrid between Jaeger's Post Oak grape (V. Linsecomii), No. 13, and Vitis rupestris, (Jaeger's No. 60,) an exceedngly hardy, prolific black grape of medium size, free from disease. It makes one of the finest of clarets. It is a most valuable new strain of pure native blood for the experimenter to use in hybridizing. The flower needs fertilization to secure a full crop.

PEARS.—Le Conte deserves high commendation for earliness, prolificacy, beauty, fruitfulness, great vigor and fine appearance of trees, and it is a very profitable market variety in the South. Indeed it has revolutionized pear culture in the Gulf regions. Kieffer is better in tree than Le Conte, and is equally prolific, beginning to bear at a younger age. For very late canning it has no equal, and is passable for eating when properly ripened.

APPLES.—Arkansas Black is a fine dark-red winter apple; tree vigorous and prolific. A good keeper. Gano appears to be a decided improvement in color and quality on Ben Davis. Tree equally good. Fanny has fruited here two years, and sustains all the good things said of it by Charles Downing as a vigorous, prolific, large, handsome, good, very early, bright-red variety, much finer than Red Astrachan. Probably the most unique and desirable novelty of the decade is the bloomless, coreless, seedless apple. It is of good size and quality, and a good keeper. It originated in Virginia, and its character is vouched for by numerous reliable persons. The tree bears well annually. Among apples this promises to equal the Sultana seedless grape from which the high-priced seedless raisins are made. The Loy apple, which secured the prize at the New Orleans Exposition as the finest new variety over many others, is highly indorsed by all acquainted with it as a very fine winter variety. Wealthy in vigor of tree, productiveness, hardiness, beauty and goodness, has taken a first place where known. Bledsoe is a variety of Texas origin. It possesses great vigor, fine size, good quality, and is a certain and quite persistent bearer. It is a midsummer and fall apple in the South. It may be over 10 years since the Missouri Pippin was first introduced, but it is new, and takes a high rank as a good, red winter apple in the Southwest. The tree bears very young and profusely.

PEACHES.—The Peen-to along with the Chinese Honey and their seedlings now becoming numerous, have enabled the extreme South, especially Florida, to grow peaches profitably. Elberta is probably the most valuable yellow peach especially in the South, (also fine in the North) in cultivation. Onderdonk is some weeks later than Elberta. It is a clear lemon-yellow peach very successful in the extreme South. The Family Favorite is of Texas origin and is similar to the Thurber, but less acid and earlier. It is a very certain and prolific bearer. Sylphide Cling is a seedling of the Chinese Cling, but of better quality. It is not quite so large but of better color; it is very certain and prolific and ripens about with the Oldmixon Cling. The Bequett Free, from California, is a peach resembling the Oldmixon Free, but larger, a week or ten days later, and if anything better in quality and color; the tree is fine and prolific. Henrietta or Levy is a cling of a fine yellow color with a red cheek, about 15 days later than the Heath Cling; a very prolific peach where it will ripen. Bonanza is a white-fleshed free, a vigorous, prolific, good peach a week later than the Salway. Topaz is a large yellow free; similar to Salway, three weeks later, with large bloom. It is certain and prolific. Valuable South and in California. Barnes is an orange-yellow cling of good size and quality, productive, successful in the South; two to three weeks later than the Henrietta.

PLUMS.—Lone Star is a decided improvement upon the Caddo Chief and other extra-early Chickasaw varieties. It is nearly as large as Wild Goose, quite as good and productive, but not a strong grower. Marianna comes to fruiting more slowly than other Chickasaw kinds, and reports with regard to it have been very conflicting; but with several this year in Texas it fruited very finely, and ripened with the Wild Goose. It is nearly the same in size. With other people it produced little, and was smaller than the Wild Goose, and not so early; but in these cases the trees were too rank and leafy. In all cases the tree is a marvel of beauty and healthfulness. It grows readily from cuttings, and trees from these never sprout from the root, nor are they troubled by borers. It makes a very fine stock for other plums. Botan ripens about with the Wild Goose, is nearly the same size; a dark handsome purple; quality of fruit fine, tree excellent. Ogon is a little later than Botan, but much larger. It is of a clear light yellow, fine, rich quality. Tree good. Wooten is a fine Chickasaw, found on the Colorado river, Texas. It ripens about two weeks later than the Wild Goose, is not quite so large, but of better quality. In color the fruit is a bright red; and hangs on well. The tree is immensely prolific. Forest Garden is a pure Prunus Americana, and tested here with Quaker, De Soto and many others of its class, it stands first for vigor of tree, productiveness and persistency in bearing and freedom from disease, as well as in quality of fruit, which is nearly as large as any, being larger than the De Soto. Golden Beauty is a peculiar type or species, being neither Chickasaw nor Americana, and though Southern, yet hardy. It seems to embody the botanical characteristics of Prunus umbellata more nearly than any other. It is wonderfully prolific and ripens much later than other classes of American plums—about with the Heath Cling or Salway peaches. It is a clear orange yellow when fully ripe and good in quality, fine for jellies, jams or preserves, and is nearly as arge as the Wild Goose when fully developed. It is nearly a freestone. Wayland is of the same class as Golden Beauty, a little later and larger, bright crimson, with white specks, and to my taste it is the best in quality of all of our native plums. Its productiveness and vigor are astonishing.

BLACKBERRIES.—Early Harvest has enabled us to begin the season of blackberries about three weeks earlier than before its introduction, with a good berry and very profitable shipping market. Erie has a finer berry than Kittatinny and a healthier plant.

STRAWBERRIES.—Nothing has yet displaced Crescent and Capt. Jack here for market, owing to their productiveness, hardiness, and good market qualities; but Jessie, Bubach No. 5, Eureka, and above all the Parker Earle of Texas, are hot contestants for the field and doubtless will long hold important places. Warfield No. 2, from Illinois, Mrs. Cleveland, from Ohio, and Cloud, from Mississippi, likewise promise splendidly. Of all the very recent kinds the Parker Earle is the most distinct in characteristics, and at once the finest in plant, berry and productiveness.

FIGS are of interest chiefly in the South. Among many kinds the Magnolia, Adriatic, San Pedro and Black California head the list for fine size, quality, and the faculty of producing a crop on young wood from the ground the first season.

JAPAN PERSIMMONS.—Many varieties are doing well all through the South and doubtless the persimmon will become in time an important fruit, especially for home consumption.

Grayson Co., Texas.

FROM STATE POMOLOGIST P. M. AUGUR.

There can be no doubt that as much improvement in the production of new fruits has been made during the past 10 years as during any previous decade. One point, however, is sadly overlooked by most cultivators, viz., that a highly organized variety capable of the best results under appropriate treatment is more likely to fail under neglect than one of less than half its real capacity, even as a 74-pounder with a small charge of powder would be a failure. Hence the Belmont, the Jewell and the Jessie strawberries, and even the Sharpless, often fail for just this reason.

The requirements of any variety must be fully met to obtain complete success. Any variety forming large crowns and therefore capable of an enormous crop of large berries is for that very reason susceptible of greater injury than other sorts from exposure to severe vicissitudes and violent extremes of weather. An intelligent application of this principle is of the highest importance. I do not care, in making selections, to be critically limited to 10 years, as it takes more than that time to determine all the merits or demerits of a variety. The Baldwin apple 10 years after its first introduction had hardly attained its merited standing as the leading apple in the country, and the same may be said of the Bartlett or the Anjou pear.

Among apples I would mention the Yellow Transparent as a most decided gain in earliness and for market. There are several other favorable candidates which I forbear to name. The early Margaret pear is early, excellent and extremely productive.

Among grapes which, of course, date back more than 10 years, are Moore's Early and Worden, Niagara and Pocklington, Brighton, Ulster and Hayes. Some of these need better culture and care than the average planter gives; but they are all valuable when properly treated.

Among peaches there are several candidates of great promise, which I forbear to mention till they have been more fully tested. Fay's Currant is valuable beyond question.

The Nemaha and Dillon raspberries are both good, hardy and productive. The same may be said of the Erie and Minnewaski blackberries. The Jewell, Jessie, Bubach No. 5 and Belmont I have found valuable, but neither of them will stand neglect like the Crescent; nevertheless, they are valuable to those who can give them the needed attention.

What the cultivator needs, especially in these days, is improvement in methods more even than in varieties. Indeed the former is needed to give success to the latter; and if this is done we have new varieties that greatly eclipse the older ones.

Middlesex Co., Conn.

FROM SEC'Y. L. A. GOODMAN.

APPLES.—The Gano is an improvement over our most profitable apple, the Ben Davis, because it is equal to it in all other respects, and is a handsomer apple and of better quality. The Babbitt is the equal of the Baldwin of the East, and is the Baldwin for the West, and that is saying a great deal for it. The Baldwin is entirely worthless with us here. The Howell is an improvement on the Minkler, (which is one of our best keeping varieties) because it is a little larger.

PEARS.—We have a pear or two—seedlings of Missouri—which seem to be improvements, but they have not been tested enough. The Kieffer succeeds remarkably well.

PEACHES.—Elberta is an improvement on any of our old peaches, because it is more hardy and prolific, and if the tree be well cut back, the fruit will be of very fine size. Bonanza is also in the lead, because it is a remarkably good late peach and ripens well.

GRAPES.—The Niagara is an improvement on our white grapes, because it is so hardy and such a good bearer. Mr. Burr, of Leavenworth, Kansas, has brought out the best early grape I know anything about. Because it is so early, prolific and hardy is reason enough to call it an improvement.

RASPBERRIES.—Hopkins is a long way ahead of any of the older kinds with us, and many people have discarded all others. It is early, prolific, hardy, regular in ripening and lasts a long time in fruit.

Jackson County, Mo.

FROM REV. L. J. TEMPLIN.

This locality is becoming famous for the fine fruits that are raised here. It is nearly surrounded by high hills and mountains, which protect us in a great measure from all violent storms, and extremes of cold. Our winters are mild and dry, sunshine prevailing almost constantly from September to March. Our soil varies from very tenacious, calcareous clay to drifting sand. The prevailing kind, however, is a rich loam varying in degrees of quality. Apples and strawberries succeed well on the clay soil, and all common fruits, peaches excepted, do well on our loam.

APPLES.—Nearly all varieties that have been tried succeed well here. The most popular for market are Ben Davis, Jonathan, Missouri Pippin, Rawle's Janet, Winesap, Pewaukee, Yellow Transparent, Duchess, Maiden's Blush, etc.

PEARS have been a fair success, though most of the trees are too young to enable us to determine positively what they are to do for us in the future. The worst danger seems to be from their early blooming, which exposes them to spring frosts. Our very warm spring sunshine, running up into the eighties in March and into the nineties in April, so warms up both soil and atmosphere as to bring on vegetation very early in the spring; and our contiguity to the snow-covered mountains, and the rare, dry atmosphere render spring frosts somewhat liable.

PLUMS of the cultivated varieties, and cherries have not yet made themselves a sure standing as profitable crops. The Morellos seem to be the only cherries that we can rely on for profit. The Wild Goose plum is not a success yet. It may do better in the future. It needs something else near at hand to fertilize it. The Marianna has given excellent satisfaction. We have some native kinds that are about equal to any of these, being hardy, prolific and of good size and flavor.

BLACKBERRIES.—The Lawton and Kittatinny are too tender for us. The trouble seems to be due not so much to the degree of cold as to the extreme dryness of our winters, which exhausts the vitality of the plants. Snyder is generally hardy, but the vines were severely injured by the severity of last winter, which was the severest ever known, killing all our grape-vines to the ground—even our hardiest kinds. This never occurred before. Stone's Hardy blackberry I have not tried, but those who have tried it speak well of it. Lucretia, though injured on my grounds, is the most promising thing in the blackberry line. I shall plant largely of it this spring. I shall set posts and draw a wire along each row and tie the vines up like grape-vines. This will facilitate cultivation and the gathering of the fruit.

RASPBERRIES.—The Doolittle is hardy and prolific, but too small to be profitable. Mammoth Cluster is vigorous, hardy, prolific and profitable. Gregg is too tender and has been generally discarded. Tyler is early, very hardy, and immensely productive. It is our most profitable kind. The reds have not proved a success. The Turner is too tender. The Crimson Beauty is on trial. I intend to try Shaffer's and Johnston's Sweet this year.

STRAWBERRIES.—Of this fruit we have tried a great many varieties. The Jucunda, Manchester and Crescent are the most popular. The Lacon is one of the most profitable for me, giving as many large berries as any other and small ones "too numerous to mention." The Jumbo is only a shy bearer with me, and too soft. Old Ironclad makes plants and but little else. I shall discard it. Big Bob does only fairly well with extra culture. The Jewell produces but little fruit and no plants to speak of. I shall give it another trial and a better chance, and if it does not do better it must go. I expect to plant five acres this spring mostly of Manchester, Jucunda, Crescent and Lacon; but I shall also set some Bubach, Kentucky and Jessie.

Fremont Co., Colo.

FROM T. H. HOSKINS, M. D.

APPLES.—The Wealthy, though the seed of the first tree germinated about 20 years ago, has become generally known, and is hailed, along the northern border, as well as in Canada, as the most valuable apple yet introduced, for that section of our continent, within the limit given. In early bearing, productiveness, size, beauty and quality of fruit, the Wealthy stands among the very best of American apples. To this I would add the McIntosh Red, which, where not affected by fungous spots, is even superior to the Wealthy. As an early apple, the Yellow Transparent has risen into view, and its culture has extended all over the country within the same time.

PEARS.—My own direct personal experience is limited to the New Russian sorts, introduced in 1883-4. These are the only pears that have yet been found to endure 40 degrees below zero unharmed; and a large extent of populated North America requires this endurance of all its tree fruits. Bessemianka and Sapieganka are two fall pears of medium size and very good quality, good growers, and though not yet yielding more than a few specimens, evidently early bearers, and quite at home in the "Cold North." From them will undoubtedly be produced a new class of iron-clad seedlings, extending pear culture at least 200 miles further north on this continent. In that region all other known pears have proved to be, practically, hopeless failures.

CHERRIES.—The newly imported "Griottes" (Mazzards), from North Germany, Poland and Russia, have given to the same section a good class of fruit of this race. In size and quality some of them, at least, are decidedly superior to any hitherto known in America under this name; while they prove themselves not only able to endure our hardest winters uninjured in tree, but also in their fruit buds, giving a full crop without failure. It is too soon to give a selection by name from among these, but out of nearly 40 kinds in hand, such selections will be possible within a few years. They all seem to be good growers and bearers, and the selection will turn, therefore, on their other points of value. Some of them are distinctly sweeter and larger than any of the Mazzards before known to me.

PLUMS.—Moore's Arctic, though not large, or of superior dessert quality, has acquired a high repute for early and profuse bearing. It is rather over-named as indicative of its

hardiness, though it is probably the hardiest of the American seedlings of Prunus domestica. Several new sorts from amoi g our native plums have appeared, and of these, for the North, De Soto seems to be the most valuable variety, either for home use or market. A considerable number of the plums of Northeastern Europe are now undergoing test, and the prospect is fair that we shall find among them some very useful recruits for far northern orchards.

STRAWBERRIES.—The Crescent is very widely accepted as the most generally successful among the early sorts. Sharpless, for size, has taken the palm; and, among other sorts, Manchester and Windsor Chief seem to have acquired general and permanent acceptance. These are non-staminate. No staminate sort yet seems able to push Wilson from its throne; though there are many aspirants under trial.

RASPBERRIES.—Turner, Cuthbert and Shaffer are positive and, I think, permanent additions to the list of valuable reds; while among the blacks I have yet to see any real advance beyond the old Doolittle.

BLACKBERRIES.—I recognize no notable addition among these since Snyder. We have nothing positively new and valuable among gooseberries; but among currants, Fay's Prolific is a great gain, giving us a fruit equaling the largest in size and the most productive in crop and vigor of growth. I much regret that very little, if any, gain can be recorded so far as American gooseberries are concerned, a thing much to be wondered at in so improvable a plant.

Orleans Co., Vermont.

FROM A. B. COLEMAN.

During the past ten years many new varieties of fruit have been introduced, yet comparatively few have proved valuable. Thousands of dollars have been spent by professional fruit-growers as well as by amateurs in efforts to procure something a little better than anything before tried. It is unfortunate that the record does not show more successful results than the absolute facts would indicate. A new variety of fruit always sells at a high price when first introduced. Many of such introductions possessing no other merit than that of proving remunerative to the introducers, are speedily discarded as worthless or unprofitable. The present seductive method of advertising, with judiciously selected descriptive adjectives and handsomely-colored plates, does its work very effectively and catches many a tyro as well as professional in the fruit business.

I am not prepared to say just what progress has been made during the past ten years in the production of new fruits. The list has been lengthened, but the improvement has not been in proportion. The lists of all kinds of fruit cultivated in this country are too long, and the descriptions given by many nurserymen are so extravagant and misleading as to confuse the uninitiated in making selections. Were we to take the descriptions as we find them in the catalogues, as our guide, we would invariably select fruits of recent introduction, as they are made to appear far superior to any of the older sorts. Fortunately we have a few faithful sentinels who tell the truth, unvarnished and unadulterated, about new fruits as they appear, stripping them of all the false and fanciful claims made for them by those directly interested. No one has rendered more efficient service in this direction than "THE RURAL NEW-YORKER." It has fought vigorously and valiantly for truth, right and justice, regardless as to whom its action hurt or offended.

It is questionable if a better apple has been produced in the last ten years than Ben Davis, Winesap, Limber Twig, Baldwin or Nickajack, Winter Pearmain, Grimes's Golden or Newtown Pippin.

Perhaps no better pear has been brought out than the Bartlett, Angoulême, Louise Bonne de Jersey, or Seckel, and no better peach than Oldmixon, Heath Cling, Crawford's Early and Late, Flater's St. John or Amsden. The Yellow Transparent Apple has grown popular on account of its extreme earliness—and in this respect only, is it superior to the Early Harvest or Red Astrachan. Many Russian apples have been introduced which, it is thought, will prove valuable in the Northwest on account of their hardiness.

Among small fruits the strawberry and grape lists are growing very long. The Empire State, Pocklington, Jefferson, Francis B. Hayes, Moore's Early, Diamond, Triumph, Eaton and Woodruff Red, among the newer grapes, will doubtless prove very valuable; but not more so than many older varieties. The new strawberries are almost innumerable. We have large additions to the list every year, coming from all parts of the country. In the introduction of new strawberries, quality seems to have been sacrificed for size and productiveness. The old Charles Downing and Kentucky are yet popular all over the country. They do well everywhere and yield good crops of excellent berries when treated with even moderate consideration. The Kentucky is still regarded by many as the best late berry, all things considered, yet introduced, although it has had strong competitors in the Glendale, Windsor Chief, Daniel Boone, Manchester, Ohio and others. The Crescent has perhaps yielded more money to the professional fruit-growers since its introduction than any other variety ever did during the same length of time. Its great productiveness, when well supplied with pollen from another variety, and its capacity to take care of it self under adverse conditions of culture soil and season, have made it popular over a wide range of territory. But its rival is coming; in fact, it is already here. Cloud's Seedling is its name. This "Cloud" is rising over the Southern horizon. It is making its way to the North, the East and the West. It is dark and ominous, and will evidently develop into a cyclone. It is going to sweep the country. It has all the characteristics to enable it to accomplish the task. It has vigor and strength; it needs no petting, or stimulant. It asks for no fancy picture of itself, for no indorsement from Messrs. Dick, Tom or Harry. It is coming forward upon its own merits, and will consign many a sad and sickly novelty to that bourne from which no berry ever returns. Let us wait and watch the fun. The Bubach, Jessie, Haverland and Summit seem to be making a fine impression wherever they have been introduced, and will doubtless become very popular.

Among raspberries the Tyler and Souhegan are perhaps the best early, and the Gregg the best late of the black-caps. Turner and Cuthbert are the best of the reds. Shaffer is the largest of all raspberries, and a very excellent sort. The berry is purple and the vine is a vigorous grower, very prolific and the best of all for the family garden. It makes an excellent jam. The pleasant acid flavor is very refreshing.

Caldwell Co., Ky.

THE CRANDALL, THE NEW BLACK CURRANT.

A SEASON'S trial of this new currant shows that it really has some very desirable qualities. In spite of the severe drought of last summer, it made a vigorous growth, fruiting on the one-year-old wood. It is like the common black currant in being absolutely free from insect enemies, either here in New York State, or in Ohio, or in Kansas, its original home, but it differs from it in not having that peculiar odor, resembling that of a bed-bug. The taste is like that of a ripe gooseberry, with something of a sub-acid quality of the red currant. For pies, jellies and jams it is not inferior to any of the small fruits which are similarly treated, and unlike raspberries, it has but few seeds. As far as the disseminators, Messrs. Frank Ford & Sons, of Ravenna, O., are able to learn, the Crandall is a hybrid from the Red Cherry currant, (Ribes rubrum) and the Missouri Yellow (Ribes aureum) and with me its habit and productiveness confirm that idea. The color is a shiny bluish black; the size ranges from a half-inch to three quarters of an inch in diameter. It greatly resembles a Concord grape, and as a market fruit, seems almost without a rival.

E. E. S.

WESTERN NEW YORK APPLES.

IRVING D. COOK.

Present discouragement owing to heavy production and consequent low prices; hopes for the future arising from mismanagement of orchards, and room for improvements in planting, care, and marketing.

IN view of the enormous quantity of apples harvested the present season in Western New York, and in nearly all other localities adapted to their growth, the ruinously low prices prevailing at the present time, and the discouraging outlook for those unable to take advantage of the earlier and more remunerative markets, it is but natural that the orchardist should be forcibly impressed with the thought that perhaps this industry, which once seemed to insure pecuniary success to those engaged, was, after all, to result in disappointment, failure and loss. And were the vast and numerous orchards that have been planted during the last two or more decades properly cared for in all the essentials necessary for their productiveness, and in full bearing every year, there would indeed be sufficient cause for apprehension.

But when we consider that thousands of trees thus planted, owing to neglect in various ways, die before arriving at bearing age; while as many more, after struggling for existence for a few years only, produce partial crops of small and inferior fruit, and that it is only in exceptional years like the last, we are likely to have a full and nearly universal crops in all parts of our fruit sections, we may well conclude that he who wisely and perseveringly adopts the methods calculated for success in this direction, and produces for market the best varieties of first-quality fruit, will be amply rewarded.

Experience is the best of all teachers, as many of us have learned in reference to some of the best methods: for we now discover that our bearing trees are, many of them, much too near together for the full development of the fruit, and we unanimously agree that 40 feet is as near as they should have been planted, and many who for years have cultivated and tenderly cared for their orchards, are now reluctantly, after they have arrived at bearing age, engaged in cutting out alternate trees, which is seemingly the only alternative left; for it is becoming fully demonstrated that light, air, and the uninterrupted rays of the sun are essential for the production of the most desirable fruit. And, again, we are becoming thoroughly convinced of the fact that we cannot reasonably expect to grow fruit thoroughly well, unless the tree maintains a healthy and vigorous growth, which can be attained only by the required cultivation, or a free application of surface manure spread evenly over the ground as for other farm crops, thereby acting as a mulch and furnishing food for the myriad rootlets constantly reaching out for nourishment.

Insect enemies must also be persistently fought, for, no matter how large and well developed an apple may be, if defaced by worm holes, its market value is materially lessened. Paris-green and London-purple, if properly applied, have proved effectual insecticides in numerous instances. In the matter of sorting and barreling the fruit for market there is undoubtedly great need of reform, and when buyers discriminate properly between first-class, selected fruit, and that ordinarily put up, and the producer is fully remunerated for so doing, then only can we hope for improvement in this direction.

Let all of us, then, who are engaged in this branch of farm industry, learn lessons of profit from past experience, and adopt whatever methods will tend to promote the growth and productiveness of our orchards, grow more and better fruit, besides giving us the conscious satisfaction of having so well performed our part that, notwithstanding the discouraging present outlook, perhaps the balance sheet will yet be in our favor.

Miscellaneous.

NEW LEGISLATION NEEDED CONCERNING MONOPOLIES.

No. 1.

PRESIDENT W. I. CHAMBERLAIN.

JUST laws are of slow growth. They must rest upon the solid basis of philosophic justice and ethical right, and must regard all the varying circumstances involved. New laws grow out of changed conditions. The growth of irrigation in Colorado and in California, for example, revised and almost reversed the old code of "riparian rights" or laws of watercourses. It is therefore perhaps not strange that our legislation, for the past 50 years, has lagged far behind the giant strides of progress in invention, manufactures, agriculture, population,—in short, it has fallen behind the growth of scientific knowledge and industrial skill, and the increase of material wealth in this amazing nineteenth century.

Clearly many of our laws must be modified, and new laws must be passed to meet our changed conditions. Nowhere is this more needed than in fixing the *right* of capital invested in monopolies, and its *limitations* necessary to protect society under Republican government. Now since ours is a government "of the people, by the people and for the people", it is clear that the people themselves must grasp the underlying principles; or the laws made by them and their representatives will not be just to all conflicting personal and society interests involved. Let us study briefly some of those underlying principles The farmers must grapple with existing evils springing from monopolies or these evils never will be righteously prevented.

OWNERSHIP.—All ownership rests upon the fundamental, axiomatic right of every human being *to live by work;* that is, to have, enjoy, sell, give, keep or bequeath the results of his labor expended upon natural material. This individual ownership, however, *is never absolute and unlimited.* It is always subject to the needs of society and the support of the government; for men by their very nature and limitations must live in society in mutual interdependence of rights and duties; and society must have a government. Now, a just government renders valuable service to the individual in the way of defence, protection, redress, diffusion of knowledge, promotion of agriculture, mining, manufactures, navigation and commerce; that is, it promotes the creation, diffusion and enjoyment of wealth in its widest and best sense. It makes property possible and valuable.

TAXES.—This all costs money, and taxes are the price paid by persons and property for this aid and protection; and since all persons and all property are protected all should be taxed. As to property, the just principle seems to be to tax all actual, tangible property, where the property itself lies, at its actual value with no exemptions of private property and no duplicate taxation as, for example, of land, and then of a mortgage resting on it without any offset on the land. Taxes are a just limitation upon the ownership of all private property, and avoidance of them by false oath, concealment or otherwise, is theft from society and from government, its representative. I assume these principles as granted and therefore do not argue them.

PROPERTY IN LAND.—From the very nature of land it is a *possible monopoly*, and hence requires special limitations, for reasons to be given further on. Land is both *fixed in position and indestructible in form and matter.* In these respects it differs from other forms of property. But society must have roads, streets, railways, docks, bridges, sites for public buildings and the like, and these must often pass through or rest upon land till then owned by individuals.

"EMINENT DOMAIN."—The right of the government to take, or to empower railway or other companies to take, such private land as is needed for public uses, even without the owner's consent, is called the right of "eminent domain." This right, I think, does not grow out of the fact that society was the original owner of the land before it was divided by original sale to individuals, but from the nature of land noted above, and the needs of society. All our property and even our services and lives in war are subject to the needs of government, to protect *its* life and promote *its* usefulness to society. Now, when government needs our other property or our services we may commute in kind, that is, pay a cash tax, or send a substitute to war. But when it needs our land for roads, etc., it needs that particular land. We cannot commute in kind or in cash. The difference lies in the nature of land, not in the origin or extent of the right of the government to take our property.

When the government takes the land of individuals, however, for public uses, since the present owners paid society, its original owner, the value of the land when thus purchased, and since they have labored or paid for labor to improve it to its present condition and give it its present value, it is clearly just that society, if it need the land again for public uses, should pay its present owners its present value, and the damage, if any, to adjacent land that is cut, divided or injured. If you sell me a calf, and I rear it to an ox, and you need it back, you should pay me the value of the *ox* and not of the *calf.*

This right of "eminent domain," not only does not deny, but establishes the individual ownership of land. Not even society through government, its agent, may take or empower any one to take private land needed for public uses, except by paying the present owner its present market value, and damages, if any.

LAND A POSSIBLE MONOPOLY.—But property in land is still further limited for the good of society, from the fact that it is by its very nature and by the constitution of man a possible monopoly. Now, the right to life by labor involves as a consequent corollary, the right of needed access to and use of the materials and forces of nature, God's gifts to the race. The world does not "owe every man a living." It does, however, I think, owe him a fair and equal chance to earn one if he can and will. That is, it owes him the possibility of needed access to nature's materials and forces, that he may earn such living if he can by skill and toil of brain and hand combined. Land is made up of these materials, and gives access to these forces. But in order that all men may have needed access to land, no one man or class of men should be permitted by Government to have a local or national monopoly as against the right of society or of individuals to purchase and use needed portions.

But in England, for example, there are some 32,000,000 acres of land and some 25,000,000 people, not quite one and a-third acre to each inhabitant, scarcely enough to give sustenance to the people even if all the land were devoted to agriculture. But ten thousand men own two-thirds of all this land, and keep much of it in parks, game closes and the like, to the exclusion of agriculture, population, schools, churches and social life, to the increase of poverty and crime and to the serious damage of society. These ten thousand landed aristocrats own, each, on the average, *five thousand times as much* as each of the rest of the people can own on the average unless they emigrate. This outrageous inequality dates back to the Norman Conquest when the king, so to speak, carved up the island and dished it out to favored courtiers and captains, who with their descendants did their best to hand down the outrage and make it permanent by ingeniously devised laws of primogeniture, entail and difficult land conveyancing.

Such facts gave rise to Herbert Spencer's, and later, to Henry George's, views to the effect that *all* individual ownership of land is fundamentally wrong, a robbery of society. But manifestly government may control individual land-ownership to any extent needed, without destroying it. The fact that such ownership has not always been properly controlled in the interests of human progress does not prove that it cannot be, or that it is wrong *per se*. Since property is the result of labor wisely expended on material, and since land is material, philosophy seems to show that property may vest in improved land as justly as in other improved material, while history seems to show that individual ownership of land, as of other things, is best if properly controlled; that it is the best incentive to individual effort, to the creation, distribution, preservation and rational enjoyment of wealth, to human progress and to the highest and best civilization.

HENRY GEORGE'S PLAN.—In this country the original distribution of land by the Government to actual settlers was, on the whole, wisely planned to correct the great evils of English land tenure, though it has not always been so wisely executed Measures may yet need to be taken to prevent, or even break up without injustice, the ownership of large tracts of contiguous land by individuals, companies or syndicates, especially non-residents. On the whole, however, the tendency of our laws of inheritance, land tenure and transfer, and the drift of our free institutions, is to break up large landed estates rather than to accumulate them. Mr. Henry George's plan of practically confiscating land values to the State, by removing all tax from all other property of every sort, and putting it all on land values in form of *rent* paid to the State, does not seem just. It will not meet the approval of the millions of small farmers who have put into their improved farms, in purchase cost and subsequent labor and expense, all that the farms would sell for now. They do not like to *buy* their farms of the State, and afterwards, by *ex-post facto* law, be forced to *pay rent* on them to the State, while railways, steamships, city blocks and palaces, and all other property of every sort go untaxed. That in substance is Mr. Henry George's plan. Farmers and all just-minded men should, I think, resist this. They should just as earnestly resist all tendencies towards a monopoly of land in the hands of a landed aristocracy.

RURAL SPECIAL REPORTS.

Delaware.

DOVER, Kent Co., February 20.—February 20, and not a sleigh ride yet, and but a very small amount of ice has been housed. This is enough to as onish the oldest inhabitants and cause them to take a retrospective view of the last decade or so, to produce its equal. January was mostly warm and pleasant weather; but February so far has been better winter weather. We have had several light snowfalls, but not enough snow for sleighing. The mild winter seems to have a depressing effect on the market for farm produce. Never before do I recollect eggs being as low as 12 cents per dozen. Fruit prospects good so far. The cold weather this month kept the peach buds from starting This has been a fine winter for farmers to do work, but it seems that little is ever done till the usual time to start spring work, let the weather be what it may. Cattle are unusually high and in good demand. Dealers asking $300 and $450 per pair for Western mules, and from $125 to $175 apiece for horses. Hay and other feeds are in demand. Wheat looks unusually well. Farmers are looking up help for the coming season. Every year help seems to be more scarce. I think this State would be a good place for many a strong young foreigner to come to, as the hired-hand question is certainly becoming a troublesome one to solve. It is almost impossible to get help in the kitchen also. A. G. S.

Indiana.

PENDLETON, Madison Co., February 16.—Wheat has been continually exposed to the vicissitudes of the weather, there being no snow to protect it. The mercury has been down to zero only once during the winter, though there has been the usual amount of freezing and thawing. If the weather continue mild, we may have average crops. Natural gas is so plentiful that all the towns in this region have fuel and lights in such abundance that factories are being located on an extensive scale, giving employment to many hands, and adding largely to the population, and the home market. S. W. H.

Michigan.

HART, Oceana Co., February 21.—So far, this has been a very mild winter—no snow for sleighing till February 1. Winter wheat was looking well when snow came. The thermometer has been at zero only twice this winter. Prospects for the fruit crops are good. Farm products of all kinds are very cheap, except hay which brings $10 to $20 per ton. Oats, 34 cents; wheat, 80 to 85 cents; Corn, 35 to 40 cents; potatoes 18 to 20 cents, and no market at that. Plenty of snow at this time. M. A. I.

Pennsylvania.

NEWCASTLE, Lawrence Co., February 21.—Last fall was very wet and winter brought no snow to amount to anything until within the last week. Now there are about six inches, and sleds and sleighs are running quite lively. Wheat looked well when the snow fell. There was not quite an average acreage on account of so much wet weather in the fall. Potatoes were a fair crop, but they rotted badly and there are still some in the ground, as it has been so wet that they could not be got up. They are 40 cents per bushel; eggs 20 cents per dozen; butter 25 to 30 cents per pound. E. A.

Missouri.

DUNLAP, Grundy Co., February 14.—I have read the RURAL for nearly 20 years, and for two-thirds of that time, I have resided in Missouri. I realize that an unjust feeling is entertained against Missouri by the people of the East—a feeling in which I shared once, before I came to this State. It is a fact that society here was at one time somewhat demoralized. The James gang ran at large. But that has passed away. The State now enjoys peace and prosperity. Civil, religious and educational privileges are as good here as they will usually be found anywhere. The prairies are dotted with school and church buildings. We have five State schools on the Normal plan, tuition free, and nearly one hundred private schools of high grade. The population is largely made up of Eastern people. One neighborhood near me is said to contain 200 families from Ohio. A man can talk his politics as freely here as in New York and no one interferes. To be brief, we have nice, smooth, productive land, on which we can raise any crop that will grow in latitude 40 degrees north. Fruit is a certain crop, excepting peaches. Apples never fail and usually bring a good price. They are shipped to Idaho, Nebraska, Dakota, Colorado and Texas. The prairies here are high and rolling and lie in strips. The streams are all skirted with timber. Land is very cheap, considering its quality and advantages. The fools are not all dead and we have our share of parties well-fixed who want to sell out and go West. People are just as restive here as farther east on that point. A man can buy a better farm here for a given amount than in any place I have seen or read of. G. W. F.

Ohio.

XENIA, Greene Co., March 1.—We raise potatoes, corn, wheat, oats, rye, barley and some other cereals. Corn and wheat are our principal crops. Last year we had in about the usual number of acres. Corn was up to the average in bushels, but not in quality. Wheat was below the average in yield and poor in quality. Oats good. Hay below the average, but very good in quality. Fruits abundant. Potatoes good both in quantity and quality. We planted about our usual number of acres of wheat last fall. I do not think wheat ever looked so well at this time in the year. It is just about as green and thrifty as it was last fall. We never had a better prospect for good crops than we have now. D. D. M.

Wisconsin.

APPLETON, Outagamie Co., February 12.—Lots of snow in this vicinity two feet deep or more. We have had no very cold weather yet this winter. Winter wheat was a full crop with us; spring wheat was spoiled by Chinch bugs. Oats were not a full crop; neither was corn. Potatoes were good. Hay and other fodder crops are plentiful. Prices: wheat, 90 cents to $1; oats, 25 to 28 cents; corn, 40 cents; potatoes, 25 to 30 cents per bushel. Our farmers are going into dairying more extensively every year. Stock raising and dairying are about the leading interests here now. Preparing fire-wood for home use and for market is the order of the day at present. Maple wood is worth $5 per cord at Appleton. PRUNING APPLE TREES.

A. A. C., Christiana, Del.—How should apple trees be pruned? How many branches should be cut off or left on?

ANSWERED BY DR. T. H. HOSKINS.

The art of pruning fruit trees is considerably simplified by a knowledge of its principles. What is sought for in pruning are,—first; to preserve the health and prolong the life of the tree; second, to secure plenty of good fruit; and, third, to promote the convenience of the orchardist in regard to the position of branches. When a tree's branches are ill-placed and crowded, there is a tendency with some of them to dwindle and die. In this way a tree becomes, to some extent, self-pruning Some orchardists regard this as sufficient, and only seek to aid nature by neatly removing branches that are beginning to perish. It is easy to be seen that these failing branches will produce but little fruit, and that of inferior quality; so not only the first principle, but also the second, requires their removal These ill-placed, weak and unproductive branches are also much in the way of gathering the fruit. They are mostly either in the interior of the tree, or near the ground, in both cases being shaded by exterior and superior branches of more vigorous growth. If these principles are kept in mind from the first, and the owner has enough imaginative power to form in his mind's eye a picture of the tree, as it will become in its successive stages of growth, he will be able to select for removal such growth as will clearly become injurious as the tree enlarges. In thus anticipating the work of nature, he will be led to remove evidently ill-placed branches when quite small, thus obviating the necessity for large wounds, which heal slowly, and meantime give a chance for fungi to enter, and produce decay of the trunk. As he proceeds with this work, he will be led to see that the trees he is operating upon often have their main branches improperly placed, either forming a forked trunk, (sure to split down under a load of fruit, and sometimes by its own weight, or the action of the elements,) or being too near together, and too numerous. The formation of forks with a sharp angle should not be allowed, either in trunk or branches. The main limbs should be few, and so placed that even when they become large they will not be opposite to each other, or too near together. Some trees have an erect habit of growth; others a low, spreading habit and still others a straggling, irregular manner of growth. It is possible, to some extent, to modify these peculiarities by pruning; but it is not well to remove large branches for this purpose alone. Nature will have her way; and if we try too much to interfere with her purpose, she has a way of avenging herself by striking work, and leaving us with a dead or comparatively worthless tree. Pruning for fruit is much treated of in the books, but in the ordinary way of managing apple orchards in this country, if the above named principles be adhered to, we have done about all that can be done to promote fruitfulness. With peaches and pears it is somewhat different. The peach especially requires severe cutting back, owing to its peculiarities of growth; while with the pear, pruning for fruit is more efficacious than with the apple. Pruning for a high trunk is insisted on for apple orchards by many; and in sections of the country where the climate is mild and equable, this convenience may be secured without other loss than what results from delayed fruiting. But where the winters are very cold, and especially in spots where the sun's rays reflected from the snow cause the destruction of the bark on the southwest side of the trees, low heads will often be preferred. As varieties best adapted to such localities are usually moderate growers, or short-lived, the disadvantage of low branching is not so manifest as elsewhere.

AZOTURIA IN A HORSE.

A. P. G., Fennville, Mich.—My horse seemed all right when taken from the stable and he was driven at a moderate gait two miles with an empty wagon. He commenced sweating and when stopped, showed signs of sickness and on being immediately unhitched, he lay down. After a few minutes he seemed all right again except for a tendency to drag his hind feet as he walked. He was hitched up and driven more than a mile, when the movements of his hind feet suddenly became more difficult and he gradually bloated somewhat. He then gave out entirely and had to be hauled to the barn, not having any control of his hind legs. He was in intense pain and at times would stagger up on his feet and strain as though trying to pass water, standing on his hind toes as though unable to straighten the hoof down to its usual position when standing. His hind parts would then slowly settle, and he would suddenly fall and lie on his side, apparently exhausted for some time. He passed dung somewhat dry and hard, but he passed no water. I gave pain-killer to ease him and next day when he seemed to try to pass water I injected a decoction of slippery elm back into the bladder. Urine passed after this and was very dark, almost black in color. His right hind leg then swelled from the hip to below the hock and a swelling extended from the flank, along the inside of the leg, being very sore to the touch as was the flank. At no time did he show any soreness along the back in the region of the kidneys. On the night of the fourth day he got on his feet again and could walk fairly well, though the leg and flank remained very sore. He ate well, had condition powders in bran and seemed doing well for four days when he suddenly gave out as before, but could not get on his feet at all this time. I gave him one dose of pain-killer and after twenty-four hours he got up and has been up days apparently gaining. He was hungry all through the sickness. He is in good condition and has been in the stable most of the time for two weeks. He never had any sickness before except an occasional belly-ache. He is 23 years old. He did not show signs of intense thirst, but did not refuse water. What ails him and what treatment should he have had in the beginning and what now to aid in his recovery?

ANSWERED BY DR. F. L. KILBORNE.

The disease was azoturia. The attack was probably brought on by being exercised after standing idle in the stable a few days on a full diet. This high feeding during idleness overloads the system, the liver is unable to perform the extra work thrown upon it and a form of blood-poisoning results. The high-colored urine was due to this condition of the system and not to disease of the kidneys. When first attacked the horse should have been quietly taken to a near stable and a dose of five to eight drams of the best aloes should have been administered to move the bowels and unload the system. Had this been done the horse would probably have recovered in three or four days with no farther treatment. After the second severe attack, the aloes might have been followed by one-ounce doses of liquor of acetate of ammonia with two drams of chlorate of potash every three or four hours. Until the animal was well on the road to recovery, very little food should have been given and that largely in the form of mashes or scalded oats. Now it might be well to give the following powder night and morning. Pulverized nux vomica one-half dram, pulverized gentian root and ginger each two drams. The attacks of this disease can usually be avoided with a little care. When the horses are idle, reduce the feed, especially if they are being well fed. If this precaution has not been taken, the attack may still often be avoided by working the animal slowly for a few hours, after which an attack is not likely to occur.

DROPSICAL SWELLING OF ABDOMEN IN MARE WITH FOAL, ETC.

E. C. A., Aberdeen, Dak.—1. My 12-year-old mare, due to foal about April 1, has for some time had, in front of her bag, a slight swelling covering a surface as big as both my hands, and from one-half inch to an inch thick. Since Christmas it has swelled nearly all over the belly, extending to within a few inches of her front feet, and on each side to a line drawn from the front to the hind feet. When I press the point of my finger against it, a dimple is left for quite a while, and when

the whole hand is used, it leaves an impression. The swelling began for the first time to be tender a few days ago, but now it can barely be touched with the comb or brush. Otherwise the animal appears to be in good health, and she has a fine appetite. Her feed is wild hay morning and noon with oat straw at night, and about two quarts of good oats per meal. The left side of the bag is swollen, while the right is in a normal condition. The mare has done no work whatever since fall. What is the trouble, and how should it be treated? 2. The same mare injured her coronet by calking it nearly two years ago, and when the hoof grew out, a ridge, like an old crack, appeared right down to the toe. I dare not drive her fast for fear the hoof would split. How should this trouble be treated? Should the place be opened again to induce healing? 3. Which of the draft breeds of horses are the most profitable for crossing on other horses so as to produce animals weighing 1,300 to 1,600 pounds?

ANSWERED BY DR. F. L. KILBORNE.

1. The swelling is of an anasarcous or dropsical nature, and is not an uncommon occurrence in the mare during the latter part of the period of gestation. It would be much better for the mare if you could work her a little daily. If this cannot be done, she should at least have some daily exercise in a large box-stall, or the run of a yard. Bathe the swelling daily with camphorated spirits, and rub it well with the hand or a stiff brush for 15 to 20 minutes. Give one table-spoonful of the following powders on feed twice daily: nitrate of potash, chlorate of potash and iodide of potash each four ounces, pulverized nux vomica, one ounce; pulverized gentian root, eight ounces; mix. The swellings will probably disappear after foaling if not before. 2. It would not be advisable for you to open the cut again. You would be liable to make it worse rather than better. Such blemishes are usually permanent when once healed. 3. Read the articles which appear in the RURAL from time to time, wherein the good qualities and desirable points of each breed are in turn given. Compare the claims made for each breed by rival breeders. If possible examine each breed in person at the stables of such breeders. After looking the ground fairly over, you must be your own judge as to which breed will be the most profitable for your purposes. While you might prefer one breed, your neighbor might succeed better with another. And as to which would be the most profitable breed, more depends upon the breeder than upon the breed chosen.

MORE ABOUT POTATOES.

E. D. B., Cylon, Ind.—1. What potato now before the public gives the greatest yield regardless of quality? 2. What does the RURAL think of the Green Mountain as regards productiveness and earliness? 3. What has been the largest yield on an acre of potatoes at the Rural Grounds? 4. What variety of potato should I plant with a view of obtaining the $500 premium offered by a New York publishing concern? 5. What fertilizer concern sells the best fertilizer and how much should be used per acre on potatoes, to obtain the largest yield? 6. Which would give the best results—level culture or ridging the potatoes?

ANS.—1. The R. N.-Y. cannot say. The following have yielded most heavily: New Queen, G. W. P. Jerrard, Caribou, Maine; Minister, from the same; Tonhosks, from Theron E. Platt, Newtown, Conn.; Brownell's Winner, from E. S. Brownell, Essex Junction, Vermont; Delaware, from J. J. H. Gregory, Marblehead, Mass.; Taylor, from E. D. Putney, Brentwood, N. Y.; Early Puritan, from Peter Henderson & Co., N. Y.; Niagara, from O. H. Alexander, Charlotte, Vt.; Everitt, J. A. Everitt & Co., Indianapolis, Ind.; Summit, E. E. Stine, Cuyahoga Falls, Ohio; Cream of the Field, A. Williams, Homer, N. Y.; Corliss Matchless, T. Corliss, Lockport, N. Y.; Montreal, O. H. Alexander; Green Mountain, now offered in several catalogues; Hodgman's Seedling, Horace K. Hodgman, Mason, N. H.; Nott's Victor, R. Nott, E. Charlotte, Vermont; State of Maine, Landreth & Sons, Philadelphia, Pa.; Late Beauty of Hebron or White Elephant, Rural Blush, Thorburn & Co., N. Y. The above are mentioned without regard to quality. 2. It is a heavy yielder, of *fair* shape and fair quality. 3. We have never raised a full acre with the view to the largest yield. 4. We would advise Brownell's Winner. But we do not know whether he will sell so many, as the potato is not yet in the market. We should next select any one or all of the following: State of Maine, Puritan, White Elephant, Green Mountain, New Queen, Summit. We are assuming you cannot get the R. N.-Y. No. 2. 5. We should use not less than 1,000 pounds to the acre of a high-grade potato fertilizer. We prefer not to answer the question which firm supplies the best fertilizers. 6. In a light, well-drained soil we prefer deep planting and level culture.

COLLECTION OF CANCELED POSTAGE STAMPS.

C. S. B., Hillsboro, O.—For some time there has been a craze hereabouts for the collection of old postage stamps. Some say there is a standing offer of $250 for a million canceled stamps; is that so? During a recent visit to New York I saw a bushel or more of canceled postage stamps in a window on Broadway; has that had anything to do with the craze?

ANS.—There is a considerable number of people who collect curious things of little or no intrinsic value, and frequently the rivalry between these "collectors" for the possession of something rare makes them willing to pay a high price for something of no real value. Some collect rare old books, others pistols, swords, hangmen's ropes, etc., etc. In all cases the rarity of similar articles is the chief factor in regulating the price. Many are devoted to philately, or the collection of rare postage stamps, domestic or foreign, and high prices are often paid for some unique or extremely rare thing of the kind. There are a number of dealers who supply these "collectors" and who are ready to act as middlemen between them and the possessors of such curiosities, and doubtless that Broadway stamp-laden window belonged to one. For ordinary canceled postage stamps, however, there is no market. The belief that there is a standing offer of a certain sum for such things, which varies greatly in amount according to different reports, has absolutely no foundation. Neither is there any hospital or other charity which can be benefited by such collections, as urged by others. There is also a report that dishonest persons are ready to buy stamps for the purpose of "washing" them; that is obliterating the Post Office stamp marks, and reselling them; but the risk of such a business is too great while the profits are too small from postage stamps, to induce shrewd rascaldom to have anything to do with it. The collector of ordinary canceled postage stamps must be content with the pleasure of the hunt and the satisfaction of accumulation as payment for the trouble incurred.

"GRAIN HAY."

M. H. C. G., Johnson's, N. Y.—In the RURAL'S Special Report of February 23d, a correspondent from Wallowa County, Oregon, says: "Grain hay is in greater demand for milch cows than Timothy. People out here prefer grain hay for cows to anything else. I think that if Eastern farmers would try this kind of hay they would never use Timothy for milch cows." What does the writer mean by "grain hay" and does the RURAL agree with him as to its utility for Eastern farmers?

ANS.—The correspondent referred to evidently meant by "grain hay" a grain crop cut and cured before the grain was fully formed. We have seen samples of rye hay, oat-hay and wheat-hay cured in this manner, that made excellent fodder. In many parts of the country oats are never thrashed, but are cut before fully ripe and fed out in bundles, grain and all. Indeed, in many dairy sections, oats are being fed largely in this way as the cost and labor of thrashing are saved. We should say that the value of this practice would be measured by the price of grain and straw. At the Rural Farm rye straw commands such a good price that it is wiser economy for us to let the rye mature, and to sell it as grain and straw and buy hay if need be. At a greater distance from market where straw has less value and grain is grown to feed, the practice of making "grain hay" might be profitable. We will get our correspondent to tell us more about his practice.

IMPROPERLY FED AILING PIGS.

W. S. P., Forrestville, N. Y.—I am wintering ten five-months-old pigs in three lots. About a month ago some of them became lame in the hind legs, and now they seem to be sore and stiff all over. They do not eat very well. They have been kept dry and warm, and have been fed boiled potatoes, meal and bran. Except this trouble they appear to be in good order. What's the matter?

ANSWERED BY COL. F. D. CURTIS.

These pigs have been confined too closely on a hard floor. They should go out upon the ground and have more exercise. Their food has been too heating and there has not been enough bone material in it. Leave the meal out and feed a smaller portion of potatoes. Make one-fourth of their food linseed-meal; one half of the balance middlings and one-half bran. Give a fourth of a pound of Epsom salts to each pig in the swill, every other day three times. Turn them out daily and drive them about for a half hour. One-third of the food of all pigs and hogs should be bran and linseed-meal; give salt daily. We cannot expect our pigs to stand the strain due to hard floors, and heavy bodies with feeble bones and delicate joints. It is against nature. We must feed for bones while our animals are growing and do it with the foods indicated. Their is no bone in fat.

INFLUENZA IN A HORSE.

M. M., Fergus Falls, Minn.—A fortnight ago one of my horses got a shiver just as he was led out to be hitched up. I put him back in the stable and blanketed him. The next day he refused feed and could not drink. He kept his head stiffly forward, the tendons felt hard; there may have been a little swelling in the larynx; the fever was not very high. We have no veterinary surgeon here and I put some wet pack around his throat and neck and gave bran-mash, warm drink and carrots. The fever is over, the swelling has gone down and he drinks all right; but he does not show any appetite, is weak and there is a muco-purulent discharge from both nostrils and he has a kind of snorting cough, or may be it is hawking. I tried some gentian, calamus and sulph-ferros on his feed, but then he will not take the feed. Is it influenza or catarrh, and what should I do to bring him in good condition and stop the discharge, which comes most after he has been led around a little.

ANS.—The symptoms indicate influenza. Steam the nostrils each night by feeding a hot bran mash. Give as a drink night and morning, one ounce each of liquor of acetate of ammonia and sweet spirits of nitre, and 25 drops of tincture of belladonna. Later give ounce doses of powdered gentian root and ginger, or two-dram doses of powdered nux vomica if the appetite does not return. Feed some green food, or roots or potatoes, once or twice daily if convenient.

A WEAK-LEGGED COW.

H. A. A., Drownville, R. I.—A cow of mine dropped her calf over a fortnight ago, and since then she has been growing weaker in her legs, so that at times she has to be helped up. She seems to be well in other ways; except that while she eats hay and roots very well, she refuses grain, wet or dry. She didn't eat grain well last summer so that I had to stop giving it to her in August and September. She had corn-stalks with corn on the ear while she was dry—all she would eat—and was in fine condition at the time of calving; but I think she has been growing weak in the legs for months. How should she be treated?

ANS.—Give one-half ounce each of liquor of acetate of ammonia and sweet spirits of niter, three times daily, then night and morning for three days give one tea-spoonful of pulverized nux vomica on the feed. Increase the dose by one tea-spoonful every three days. Continue for 10 to 15 days if necessary. Reduce the dose if twitching of the muscles occurs. Perhaps you have overfed on grain. After the cow recovers, feed a reduced ration, which should consist in part of light shipstuff or middlings and little or no corn. Feed only so much as she will readily eat at each feeding.

LAMENESS IN A HORSE.

H. S., Plainville, Conn.—One of my horses became lame in one foot. It kept growing worse. At first she appeared to be better after traveling some distance; later she was so lame that I had to keep her in the stable. The muscles of the shoulder appeared stiff. Thinking the trouble was in the foot, I bandaged the hoof and applied cold water. There was some heat in the region of the large pastern bone. Since applying cold water the heat has gone down into the foot, which now feels soft and watery at the coronet or around the top part of hoof. There is some stiffness in the loins. What should be the treatment?

ANS.—You give no symptoms as to the position of the lame member when standing, or the action during movement; without a careful description of such symptoms we cannot locate or judge of the character of the lameness. If we attempt to do so, from the description given, any course of treatment advised would necessarily be equally vague and general.

FOUNDER IN AN OX.

H. J. B., Birmingham, Conn.—My ox, which has been used hauling loads over a bad hilly road, is lame, being stiff in the fore-legs and hardly able to get out of the stable. Some say the trouble is due to "holding back" coming down hills; others say he is foundered. What does the RURAL say, and how should he be treated?

ANS.—The trouble is probably not due to the "holding back." Such stiffness frequently occurs as the result of founder or a chill, and this is very likely the cause in the present case. Give the ox a purgative to open the bowels—two pounds each of Epsom and common salts, and two ounces of ginger, to be given as a drench. Follow by a restricted, laxative diet and daily exercise in a box-stall or small yard. Rub the limbs once or twice a week with a mild liniment.

THE RURAL'S WAY OF PLANTING POTATOES.

A. C. L., Windfall, Ind.—What, in brief, is the RURAL'S method of planting potatoes, and which is the better application—stable manure or well rotted straw?

ANS.—We must refer our friend to previous numbers for a full explanation of the R. N.-Y.'s method. Briefly, plow or spade the land 10 inches deep. Harrow or rake level. Then dig the trenches a foot wide and six inches deep. Rake in one or two inches of soil. Set the pieces one foot apart. Cover lightly. Spread the fertilizer. Fill the trenches. This for garden culture. If manure alone is to be used, spade it under. Stable manure is far better than the straw.

WEAK-ANKLED COLT.

J. M. P., Suffolk Co., N. Y.—My two-year-old filly knuckles badly in her fore ankles. The joints slip backward and forward when she walks, so that her fore legs are of very little use to her. If she takes any exercise, she becomes lame. The short pasterns are very straight and the ankle doesn't slant back as it generally does. What should be the treatment?

ANS.—Apply the following liniment to the fetlock once daily. Hard soap, one ounce; cut up and dissolved in one pint of proof spirit then add one ounce of camphor gum and two ounces each of aqua ammonia and sweet oil. Shake well before using.

JOHNSON GRASS.

L. C. S., Bainbridge, Ohio.—Has Johnson grass been tested in this climate? A Southern friend has recommended it.

ANS.—The RURAL NEW-YORKER began testing it about eight years ago. It was also raised at the Kansas Agricultural College, at Manhattan, by Prof. Shelton. He condemns it as inferior to many other forage plants. The roots are nearly hardy at the Rural Grounds with protection. The original little plantation is still alive.

Miscellaneous.

C. C. N., Cambridge, Neb.—Will different varieties of potatoes planted side by side "mix?"

ANS.—No; potatoes *can not* mix except through the blossom and true seed.

J. A. B., Butler Center, N. Y.—At what time shall I cut apple tree grafts?

ANS.—At any time when they are not frozen, before the buds swell. They may be preserved in sand in a cool cellar.

C. N. R., Canton, Pa.—Would it injure a high-grade fertilizer, with S. C. rock as a base, to mix gypsum with it?

ANS.—No. It would not harm the fertilizer in any way. Neither would it add to its value.

W. F. G., Cleveland, N. Y.—1. What does the RURAL know about the Erie blackberry? 2. If the RURAL were about to set out some blackberries, what varieties would it select?

ANS.—1. It is thought to be the Lawton or New Rochelle. 2. We should try Agawam and Dorchester.

E. M. D., Walden, N. Y.—1. When seed potatoes have sprouted, does it kill their vitality to break off the sprouts? 2. Who publishes a weekly or monthly paper devoted exclusively to horses?

ANS.—1. Every sprout weakens the potato. 2. The Horseman, 182 State Street, Chicago, Ill.; weekly; subscription price, $4 per year.

N. R., Creswell, Col.—Should potatoes infested with wire-worms or scabby potatoes be planted at all?

ANS.—It would make no difference. Scabby potatoes are just as good for seed as any others unless they are too much injured by the scab. The beetles do not deposit eggs in or upon the potatoes at all.

M. L. F., New Hurley, N. Y.—What force-pump and nozzle will do the best work in spraying grape-vines with the Bordeaux Mixture for black rot or mildew?

ANS.—Prof. A. J. Cook who has given careful study to the matter, mentions the following: Perfection Force Pump with Perfection Nozzle. This runs with gearing, cost $30. Field Force Pump Co. (Lockport, N. Y.), Large force hand pump, same firm; Nixon Pump Co., Dayton, Ohio. He prefers the Perfection and Nixon nozzles.

J. B. G., Spokane Bridge, Washington.—A year ago, just after a very cold snap, I found a one-year-old colt very lame. He was running on the range, so I took him home and placed him in a warm stable. He grew worse for a few days and had to be helped up and

down. In about a week he began to emit a very bad odor, and the skin began to slough off his legs near his hoofs, and two running sores broke out on each of his thighs. I commenced treatment by washing the sores with warm water and Castile soap, then applying a poultice; but the sores did not heal. It seemed as though there was proud flesh. I then used burnt alum, bluestone and diluted carbolic acid until I supposed that he was well, when I sent him to the pasture. Afterwards I noticed that his hind feet were not well; the sores just above the hoofs were rough, dry and callused. What should be the treatment?

ANS.—Apply benzoated oxide of lime ointment daily until a healthy healing action is established. Then dress with pine tar, covering the whole hoofs, and rubbing well into the hair around the top of the hoofs.

DISCUSSION.

LIME FOR THE CABBAGE MAGGOT.

E. S. GOFF, GENEVA, N. Y.—On page 124 of the RURAL the statement is made that slaked lime mixed with the soil in which cabbage plants are set, will prevent damage from the cabbage maggot. This is contrary to my experience. During the summer of 1887 my colleague, Mr. Beckwith, placed about half a pint of air-slaked lime in the hills prepared for two rows of cabbage plants in the Station garden, leaving those of a third row without the lime. The soil and lime were mixed together with a trowel just before setting the plants. Now, for the result. The plants treated with the lime actually suffered more from the cabbage maggots than did the others. An examination made on June 18, showed that the plants in the rows that received the lime contained, on the average, more than five maggots each, while the plants not treated had but little more than two maggots apiece. It is certain that in this trial the lime was not beneficial.

S. N. R., HADDONFIELD, N. J.—In the Farmers' Club, Feb. 23rd, page 124, the bird described by C. H., of Afton, N. Y., is identified as the Pine Grosbeak. If the inquirer's description is correct, the bird in question is certainly not a Grosbeak, but a Crossbill, most probably the common, red species (Loxia curvistrata minor). Contrary to the description given by the correspondent, the Pine Grosbeak is as large as a robin, has not a hooked bill and never shows any green in its plumage coloration. The RURAL'S description of the habits and distribution of the Grosbeak may apply in great part also to the Crossbill, except that the latter bird is more evenly distributed during winter throughout the Eastern States, and migrates as far south as the Gulf, whereas the former is only an irregular winter migrant, rarely penetrating into Pennsylvania.

A. J. GALE, WAUKESHA, WIS.—The plan of blackberry growing that Mr. Crawford thinks might work well anywhere (as described in the RURAL of February 23,) would hardly work well here in Wisconsin. We have no blackberry that will stand unprotected and bear a crop of fruit, no matter how well ripened the wood may be. The wood may winter well, but the buds are always damaged more or less. The plan followed by growers here is to give clean cultivation the entire season, and just before the freezing of the ground bend over and cover the canes entirely with earth. Then uncover them in early spring. We treat the Cuthbert and other tender raspberries in the same manner, and have to do so to secure a good crop.

R. B., ST. HENRY OF MONTREAL, CANADA.—I very much admired the picture of the collie dogs in a late RURAL, but I would like to speak a good word for the Scotch terrier. If a couple of them are around, one will not need to protect the young apple trees with tar, felt or wire netting to keep off the field mice and moles. The Scotch terriers will save all that work. The owner can always see them hunting around in the grass wherever rats, mice or moles are to be found. As watch dogs, too, they are better than a burglar alarm. They will not let themselves be tampered with or bribed.

What Others Say.

PITHS AND SUGGESTIONS.

TRY the Agawam blackberry.....

TRY the Pearl strawberry.....

TRY the Hilborn black-cap.....

J. T. LOVETT, of Little Silver, N. J., calls the Carlough the handsomest and longest-keeping sweet apple in existence.....

MR. LOVETT describes the Abundance plum as a remarkable variety. The tree is worthy of being planted as an ornamental tree. The trees bear while very young—the nursery trees often being loaded. The curculio, he says, has no effect on the fruit—the eggs do not hatch. The fruit is large, showy and beautiful, of an amber color turning to bright cherry. The stone is small and parts freely. Season very early.....

MR. LOVETT also claims that the Spaulding is curculio-proof. It ripens three weeks after the Abundance.....

THE Wonderful peach is said to be *very* late, as large as Crawford's Late and as late as Smock .....

THE Champion quince is too late for the North. It thrives south of Penn. and bears while young.....

TRY the Paragon chestnut. It's probably of Japanese origin. The nuts are twice as large as the American chestnut and of good quality. The trees bear when three years of age .....

TRY the Louise strawberry.....

THE Monmouth for early and the Gandy for late are valuable strawberries in many places.....

TRY the Minnewaski blackberry.....

TRY the Eaton grape; try Bundy's Colerain as soon as it is offered for sale. The R. N.-Y. is inclined to regard it as the best early white, all thing considered.....

THE Berckmans grape (color of Delaware) is a healthy, vigorous variety.....

THE R N.-Y. is trying several of Macomber's pears which we believe to be of decided promise, notably Grand Isle, Dr. Hoskins, Little Gem, Macomber and Refreshing. These have been described and illustrated in the R. N.-Y., see pages 242, 203, 279, 263 and 242 in the volume for 1885.....

"THE JESSICA GRAPE.—The RURAL-NEW-YORKER mentions Mr. E. P. Powell, of Oneida county, as saying of the Jessica grape that it is a 'miserable fraud,' and the R. N.-Y. calls it an 'early good-for-naught.'" We had never supposed that earliness was an objection to a grape, for so the R. N.-Y. appears to put it. Why it is good for naught does not appear. It may be so on the poor soil of the R. N.-Y.'s place, but on good grape land it is a very excellent fruit; in fact, we doubt if the most expert grape taster could tell the difference between the Jessica and the Delaware without seeing them. So much for its quality. It proves, with us, to be a heavy cropper, resembling Delaware, also, in this respect. It is a good grower and has firm, healthy foliage. The bunches are rather loose, and the green color is not attractive for a market grape. For the family garden, where quality is wanted, we think it is a most desirable variety."

The above is from Vick's Magazine. We called it an "early good-for-naught" because that is just what it is (or was—it has been discarded) at the Rural Grounds. The few berries that ripened *were* very early. But rot destroyed most of them. It is now apparent that the variety succeeds admirably in some places, and fails in others. The attention of the reader is called to Mr. Crawford's article in this issue .....

THE Storrs & Harrison Co., of Painesville, O., say that the Wonderful peach will keep three weeks after it is gathered. They speak of the Peter apple as "Gideon's Best of All." It originated, as our readers have been informed, at Excelsior, Minn., from seed of the Wealthy. It has endured 45 degrees below zero without injury. It promises to be *the* apple for the Northwest. The above firm say that the Ogon and Botan plums are hardy. They regard the Kelsey as less hardy than the peach.....

THE Storrs & Harrison Co., offer a new grape called the Leader. It is said to be mildew-proof, as hardy as Concord, and a vigorous grower. The bunches and berries are of good size and sweeter than any other white grape they cultivate.....

PALMER'S SEEDLING, (black-cap), is represented as perfectly hardy, as early as Souhegan or Tyler, while the berries are larger, and the canes far more productive. This variety is Matthew Crawford's first choice.....

MR. CRAWFORD says that the Hilborn black-cap has not a single weak point. He fully supports the R. N.-Y.'s opinion of the Lucretia dewberry.....

SECRETARY GOODMAN (Missouri) regards the Gano as an improvement over the Ben Davis, being equal to it in all other respects and superior in appearance and quality.....

THE BABBITT, he says, is the equal of the Baldwin of the East and is the Baldwin for the West.....

AMONG gooseberries the Orange (H. M. Engle, Marietta, Pa.) is a new variety of real value. It is thought to be a seedling of Houghton. It is one of the earliest to ripen, if not the earliest. It is of a medium size, sweet and tender. The color is a dull yellow. Plant hardy and free of mildew. The Dougal No. 2 is a very distinct and valuable gooseberry. The bush is an upright grower and as nearly thornless as any kind the R. N.-Y. has seen. Berries are of medium size, hairy, light-green shaded with purple. It never mildews..

THE fruit committee of the N.J. Horticultural Society report favorably on the Crystal raspberry (originated by the late A. J. Caywood). It is a few days earlier in ripening than the Golden Queen and a handsomer berry, though, Dr. Ward thinks, not quite so heavy a bearer. He pronounces Cohanzick strawberry a failure in every way. The Hilton strawberry was favorably regarded. The R. N.-Y. can tell its friends that it is a large, prolific berry of fine promise.....

MR. WARD gives well deserved praise to Dana's Hovey pear. It is an old variety though one of the highest-flavored on the list.

The Quinn pear has been tried in various parts of New Jersey and found to be one of the very best varieties for the amateur.....

AMONG sour cherries Dr. Ward recommends the Montmorency, as it comes in after the Early Richmond. He deems the Canfield the very best for a long-keeping sweet apple.....

THE Industry gooseberry introduced four or five years ago, mildews badly in many localities while in others it does not. Ellwanger & Barry, of Rochester, N. Y., regard it as the best foreign variety ever introduced. This firm has recently introduced the Mills grape, a cross of the Muscat Hamburg upon Creveling. The bunch is very large, some clusters weighing over 12 ounces. The berry is large, round, jet black, with a thick bloom; flesh firm, meaty, juicy and rich. The vine is vigorous and productive, foliage large and healthy. It ripens with the Concord and keeps well.....

ELLWANGER & BARRY regard the following as the best of the Russian apples: Arabskoe, Titovka and Yellow Transparent.....

THE Windsor cherry introduced by the above firm (it originated with the late James Dougal, of Windsor, Canada,) bears large fruit remarkable for firmness. It is of fine quality. The tree is hardy and prolific. It is a valuable *late* variety for both market and home use.....

MR. MCCANN, Ex-President of the Elmira Farmer's Club, (N. Y.) says that, with him sorghum yields, on an average, a crop of more value per acre than corn. In every respect it is fully equal to corn as food for fattening stock or dairy cattle. It will yield 40 bushels of seed per acre.....

A WRITER in the Albany Cultivator says that generally a catalogue the whole of whose contents is quoted low, evidently with a view to undersell, had better be laid aside for future reference if required.....

Horsford's Acid Phosphate
Useful in all forms of Dyspepsia.—*Adv.*

Miscellaneous Advertising.

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has this latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

$20 FENCE MACHINE FOR $10
Freight paid. Guaranteed. Hundreds in use. Circulars free. S. H. Garrett, Mansfield, O.

Trees, Seeds and Plants.

If you want the best Garden you have ever had, you must sow

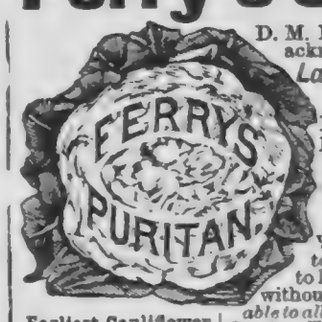
MAULE'S SEEDS.

There is no question but that Maule's Garden Seeds are unsurpassed. Their present popularity in every county in the United States proves it, for I now have customers at more than 31,000 post-offices. **When once sown, others are not wanted at any price.** Over one-quarter of a million copies of my new Catalogue for 1889 have been mailed already. *It is pronounced the most original, beautifully illustrated and readable Seed Catalogue ever published.* It contains among other things, cash prizes for premium vegetables, etc., to the amount of $3,500. **You should not think of purchasing any Seeds this Spring before sending for it.** It is mailed free to all enclosing stamp for return postage. Address

WM. HENRY MAULE,
1711 Filbert St. **PHILADELPHIA, PA.**

OVER **6,000,000** people believe that it pays best to buy Seeds of the largest and most reliable house, and they use

Ferry's Seeds



D. M. FERRY & CO. are acknowledged to be the *Largest Seedsmen* in the world.

D. M. FERRY & Co's Illustrated, Descriptive and Priced

SEED ANNUAL
For 1889
Will be mailed FREE to all applicants, and to last year's customers without ordering it. *Invaluable to all.* Every person using Garden, Field or Flower Seeds should send for it. Address

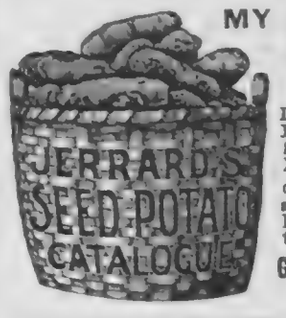
Earliest Cauliflower in existence.

D. M. FERRY & CO., Detroit, Mich.

GANDY

MONMOUTH, LOGAN, BUBACH, LIDA, HAMPDEN, WARFIELD, ITASCA, BURT,

We will send you post-paid one dozen each of above, nine new varieties of Strawberries for $2, or one dozen each of any two varieties for 50 cents. These are all of our own growing and are guaranteed true to name. Our pamphlet on "How to Grow Strawberries", price 10c., will be sent free with each order. Register your letter.
PUTNEY & WOODWARD, BRENTWOOD, N. Y.



MY **Seed Potato** CATALOGUE

Describes the choicest SEED POTATOES and the earliest Seeds, grown in the Cold North-East. It tells of the wonderfully early **MINISTER** and names special *Low Freights* East and West. It tells how to raise potatoes. *Sent free.*

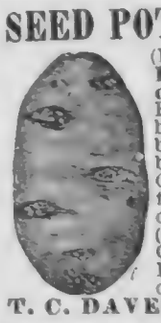
GEORGE W. P. JERRARD,
CARIBOU, MAINE.

BEWARE of a silent dog and still waters. The impure blood flowing silently through the system is a dangerous enemy to health.

Warner's Log Cabin Sarsaparilla

is the great blood purifier. Cheapest in the market. Largest bottle. All druggists have it.

SEED POTATO HEADQUARTERS



(Established 1864). The Two Best **Extra Earlies in the U. S. Early Thoroughbred,** one week earlier than Rose. The "Maud S." among earlies, handsome, and heavy cropper; resembles Rose. **Early White Ohio** combines all the good qualities of Early Ohio; crops double last year in spite of flea-beetles (at rate of 816 bu. per acre on "Rural" Grounds); quality superb. (Ask Editor Carman his opinion of it.) Other standard kinds, Prince Edward's Island, Early Rose, Early Hebron, State of Maine, &c. Send for Price List.
T. C. DAVENPORT, 124 Dock St., Phila.

VEGETABLE PLANTS—Standard Sorts, at reliable rates. Send for Price List.
M. GARRAHAN, Kingston, Pa.

600 ACRES. 13 GREENHOUSES.

TREES AND PLANTS

We offer for the Spring trade a large and fine stock of every description of **FRUIT and Ornamental TREES, Shrubs, Roses, Vines, SMALL FRUITS, Hedge Plants, Fruit Tree Seedlings** and **Forest Tree Seedlings.** Priced Catalogue, Spring of 1889, mailed free. *Established* 1852.

NOTICE TO THOSE WHO DESIRE TO ENTER FOR THE R. N.-Y.'S WOMEN'S NATIONAL POTATO CONTEST:

All who desire to enter for the Women's Potato Contest are respectfully requested to send in their names before the 20th inst Full instructions and a list of the contestants will be published at about that date.

READ what Mr. Crawford says of the Potter, Jessica and Woodruff Red grapes.

"I still think the Delaware our best grape" says Mr. Crawford.

IF there *is* an Orange quince which is distinct from the Apple quince, and we believe there is, then the so-called Meech's Prolific quince is the Orange.

Prof. Munson, of Texas, says that the Seedless apple is probably the most unique and desirable novelty of the decade. It is bloomless, coreless and seedless. It is of good size and quality and a good keeper.

READ Pres. Chamberlain's article—"New Legislation Needed Concerning Monopolies"—the first of a short series on a topic of absorbing interest.

"The world does not, I think, 'owe every man a living.' It does, however, owe him a fair and equal chance to earn one if he can and will." PRES. CHAMBERLAIN'S article, page 178.

WE like Red-caps for their beautiful plumage and shapely forms. But the immense pea-combs of the roosters are, without doubt, a decided objection to the breed. They are so large and heavy that the birds can only see laterally, while they seem to cause the roosters to keep up a perpetual twitching of the head.

State (Conn.) Pomologist, P. M. Augur, says elsewhere that a highly organized variety of fruit, capable of giving the best results under appropriate treatment, is more likely to fail under neglect than one of less than half its real capacity—even as a 74-pounder with a small charge of powder would be a failure.

PROF. MUNSON, of Texas, says that of all the very recent kinds of strawberries, the Parker Earle is the most distinct in characteristics and at once the finest in plant, berry and productiveness. This is not the variegated-leaved variety introduced under the same name. This has been discarded as unworthy of introduction.

"Fortunately we have a few faithful sentinels who tell the truth, unvarnished and unadulterated, about new fruits as they appear, stripping them of all the false and fanciful claims made for them by those directly interested. No one has rendered more efficient service in this direction than "The Rural New-Yorker." It has fought vigorously and valiantly for truth, right and justice, regardless as to whom its action hurt or offended." A. B. COLEMAN, page 178.

A CANADIAN subscriber suggests the following: "I would like all the ladies who try for the potato prizes to send their photographs to the RURAL so that their likenesses may be given in the form of a pamphlet to be sold to all of the RURAL subscribers on as easy terms as possible." That would be a souvenir worth having; but we doubt if all the ladies would be willing to have their pictures printed.

FOR 15 years past the R. N.-Y. has tried every kind of new strawberry it could hear of. Some seasons over 100 different kinds have been under trial. Reports have been made every season. The Sharpless, Hilton, Cumberland and Bubach are the ones that, at this time, we can recall as improvements over older kinds. During all these years we have raised a great number of seedlings not one of which has shown that it was worthy of introduction.

MATTHEW CRAWFORD, of Cuyahoga Falls, Ohio, says that the Jessica is with him the best of all white grapes—a good grower, perfectly hardy, very prolific, very early; the berries never drop from the clusters, and it is of the most delicious flavor. The Vicks, of Rochester, also speak in high terms of this grape. There seems little doubt that the Jessica is well worth a trial in different parts of the country. It is worthless at the Rural Grounds.

Now that considerable is being said about the cause and remedy of scab in potatoes, it may be well to remind our readers that six or eight years ago our trial potato plot was, in part, covered with a thick spread of leaves that had been gathered the preceding spring. The potatoes raised on that part of the plot were absolutely worthless. They were covered with scab caused by the wire-worms with which the soil was alive. The potatoes on the rest of the plot were not unusually scabby.

How is the path from your front door to the gate? Mud? Does it give your friends a good idea of your hospitality to make them wade through mud in order to reach your door? You ought to make a miniature macadam road of that path—you people who live in a country where stones abound. Dig the path out to the frost depth, put in stones and ram them down hard and cover them with gravel. The person who, years ago, fitted up the R. N.-Y. New Jersey Farm, laid out a series of wide flag-stone walks. We believe such walks are condemned by most landscape gardeners. We notice, however, that in this muddy weather visitors are very glad to walk on them.

FOR the first four days of the past week millers representing the winter-wheat States held a secret meeting in St. Louis for the purpose of forming a "combine" to control the flour output and influence the price of wheat. Missouri, Kansas, Iowa, Arkansas, Texas, Illinois, Tennessee, Minnesota and Wisconsin were represented and delegates from the Southern States joined the meeting on Wednesday. The men deny that they have formed any Trust, and while this is true in so far that the profits will not be divided, it is equally certain that an organization has been formed to control the flour and manipulate the wheat markets. Indeed, it is stated that for some time back the millers, by agreement, have been influencing the price of wheat, especially of the winter sort, and no doubt their action has had no small effect on the great and steady depression in the market of late.

SO OHIO BORN, 59-year-old, ex-Governor Jeremiah McLain Rusk, of Wisconsin, a man of herculean stature, with shaggy, iron-gray hair and beard, deep blue eyes, broad shoulders and heavy tread, and the simple and unaffected manners of a child, is the first Secretary of Agriculture whose action can justify the creation of the new Executive Department of the National Government. In early life he struggled on a farm for a livelihood for a widowed mother and two sisters. When 23, he moved to Mount Vernon County, Wisconsin, where he has since lived. He has always been a farmer, though incidentally a stage-line and hotel owner, a sheriff, a soldier, State bank controller, twice a member of Congress, and twice Governor of his adopted State. A man of wide experience, great determination, resolute action and unimpeachable record, the farmers of the country appear to have reason to be satisfied with their representative, and to expect a fair degeee of success in his administration.

AS FILES of the R. N.-Y. will show, nearly every kind of blackberry has been placed under trial at the Rural Grounds during the past 15 years. What is the result? Snyder and Taylor are the hardiest, though the berries are small. Early Harvest is the earliest blackberry, but it is killed to the ground about every other season. It is a feeble grower. The berries are perfect in shape and of fair quality. Wilson Jr. is the same as Wilson's Early, except that it is a little hardier. The Lucretia dewberry is worthless where standards will thrive. Crystal White is tender. Kittatinny is the best variety for the climate of New York. Minnewaski promises to be hardier. In other respects it is not superior to the Kittatinny. The Cut-leaved, largely advertised two years ago, is worthless. The Dorchester is hardier than the Kittatinny, but less productive. The Erie resembles the Lawton, and is said by some to be the same. It appears to be hardier and a trifle earlier at the Rural Grounds. Thus, we have told you, good reader, in a few lines, what the experience of many years has taught us.

FARMERS, who have more intercourse with Nature and with the dumb creatures of the fields and the woods than with mankind at large, are sometimes inclined to feel ashamed of the simplicity of their own honest ways, when they go to town and encounter the gay chatter, the fluent blarney, the smoothness and quickness, and the stereotyped smile of the lively throng, where only tokens of ease and content are allowed to come to the surface. But let the farmer adhere to his rugged virtue, his sincerity, his straightforward "yes" and "no," and his partnership with Nature's own self. Not only does he feed and clothe the well-kept bodies of the butterflies as well as the bees of the town, but it is from his ranks that their force is recruited, and it is his brave and simple honesty that keeps moral and political virtue from perishing among men. A gentleman of Springfield, who sent 100 postal-cards to as many of the most conspicuous business men of that city, inquiring about their homes during the first 15 years of their lives, received answers from 88, and 74 of them had been raised on farms.

JUST before the adjournment of Congress, the House of Representatives passed a resolution in favor of a commercial Union with Canada whenever the latter shall express a willingness to conform its tariff to that of the United States. A large proportion of the Canadians—no doubt a majority—regard such a proposition—which would discriminate against imports from even the "Mother Country" in favor of the United States—as a bid for political union also, which, they say, would be the inevitable sequence of its acceptance. Agitation for free trade between the two neighbors, or, at any rate, for a cutting down of import duties, has hitherto been confined chiefly to the other side of the frontier, and most of the strongest supporters of such a measure have been farmers. When it comes to a matter nearly touching or likely to touch their own pockets, however, they are very like farmers on this side of the line, or, indeed, men in general—they look out for what they suppose will directly promote their own interests in a particular case, regardless of their views on a general line of policy. This accounts for the signatures of 3,000 Canadian farmers to a petition presented the other day to the Dominion Government for the exclusion of "American" pork products.

HE TAKES IT BACK—A CAUTION.

IT is inexpressibly annoying to the R. N.-Y. to see such statements as the following in print:

"The Green Mountain potato, as tested by the Editor of the R. N.-Y., *on a poor, worn-out soil*, yielded almost 1,400 bus rate per acre." We copy word for word.

Again: "Cream of the Field, as tested in the Rural Grounds, in a *poor soil*, rate of yield over 1,000 bushels to the acre." The italics are ours.

What must intelligent farmers think of such stuff! Fourteen hundred bushels of potatoes to the acre on a *poor soil*!

The circular from which we are quoting is being distributed by a Mr. Alfred Rose. He was one of the parties who, in an adroit way, virtually claimed, in the earlier part of the year, that the R. N.-Y. No. 2 was in reality one of his seedlings. Not until of late have we been able to induce him to contradict the statement. He offers the R. N.-Y. No. 2 at $3.50 per bushel. Neither he nor any other person or firm can supply the genuine No. 2 at that price. Our readers are cautioned accordingly.

PROSPECTIVE IRRIGATION OF THE "ARID REGIONS."

LAST year Congress appropriated $250,000 for the purpose of investigating the extent to which the "arid regions" of the West can be redeemed by irrigation. It is proposed to dam up the canons of the Rocky Mountains so as to form immense reservoirs of water from the melting snows and heavy rainfalls of the region, to be used for the irrigation of the arid lands west of the 100th meridian, embracing an area of 150,000 square miles. The location of the reservoirs and the selection of the courses of irrigating canals are under direction of the originator of the gigantic scheme, Major Powell, of the Geological Survey, and will ultimately cost between three and four million dollars, while the construction of the works must entail an outlay of hundreds of millions of dollars; but, in return, it is estimated that the full realization of the plan will reclaim for profitable agriculture an area equal to four fifths of the present cultivated land in the United States.

The first appropriation was made chiefly to obtain more data for determining whether the scheme was so feasible as to justify further expenditure. Congress has now virtually committed the country to the execution of the project by making another appropriation of $250,000 for continuing the survey. The Governors of all the Territories to be first and chiefly benefited by the project, speak loudly in favor of at least the present work, and urge local co-operation. The Governor of Wyoming, in his last annual report, declares that the most important subject for legislation for that Territory relates to water storage, and he urges additional surveys of public lands for that purpose. The Governor of Utah states that all the lands granted in that Territory for University purposes had been selected during the year, but that they were "almost valueless without irrigation," and recommends further legislation on the matter. The Governor of New Mexico says the two most urgent needs there, are the settlement of land titles, and the storage of water. He thinks that of the 79,000,000 acres in that Territory, 60,000,000 can be rendered fit for profitable agriculture by irrigation on a grand scale. The Governor of Arizona, in urging the need and advantages of irrigation in that Territory, says that recent discoveries have shown the existence of ancient irrigating canals which sustained so extensive an agriculture as to support, in prehistoric times, a dense population in a region now almost uninhabited.

Indeed, other recent discoveries go to prove that a great population once inhabited what is now called the "arid region," and that a gigantic system of artificial irrigation was in practice there. Whatever may have been the extent and the results of artificial irrigation in that vast region in bygone days, there is now little doubt that the not very remote future will see there a system of irrigation transcending not only that of the ancient Indians, but even that of the old Egyptians, Romans, Hindoos and Chinese.

BREVITIES.

THERE is no thornless blackberry worthy of cultivation in the R. N.-Y.'s opinion.

THE Princess Louise, illustrated and described in the R. N.-Y. of January 7, 1888, is a fine Christmas dessert apple. It will keep until February. It has the excellent flavor of the Fameuse and a beauty excelling that of the Maiden's Blush.

"I CAN see no gain in the varieties of blackberries introduced during the past 10 years. During that time, however, the Agawam has been coming to the front and many have found out that it is perfectly hardy, wonderfully productive, of the very best quality, quite early, larger than the Snyder and *almost* as large as the Taylor." Here is tip-top praise from an impartial and authoritative source. See M. Crawford's article, page 176.

AS soon as the great Russian mulberry was announced, the R. N.-Y. hastened to procure half a dozen trees. In three years some of them fruited. We pronounced the tree worthless. Others fruited later. It was then found that they were of different kinds (seedlings probably) very inferior to the Downing for fruit. The trees are perfectly hardy in our climate, but what of that? The Russian mulberry was still boomed and the R. N.-Y. was scoffed at by several boomers.

THE best road or drive-way on the Rural Farm, in New Jersey, during this muddy weather, is one upon which large quantities of pine needles fall every year. The mud is seldom bad here and the road is never rough. In all the books on road-making, road officers are informed that straw, hay or pine needles are most useful for protecting sandy roads in summer or deep clay roads in spring. This drive-way on the R. N.-Y. Farm is the best possible proof of the truth of such statements.

Horticultural.

A GARDEN NOVELTY OF MERIT.

ELMER E. SUMMEY.

STACHYS affinis or tuberifera is the botanical name of a novel vegetable, which has but ately attracted some attention, first in

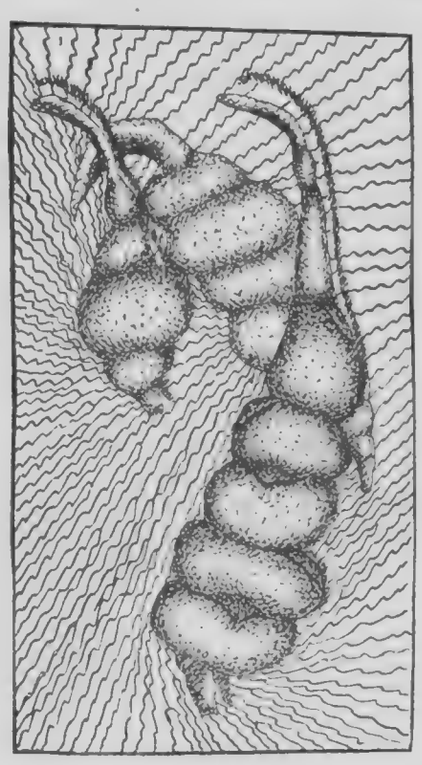

Fig. 62.

Europe, then in this country. It is a native of North Africa, but comes to us from Japan, where it is called Choro-Gi. It is allied to the English ornamental woundwort, (Anthyllis arvensis) and belongs to the same family as the coleus, and the sweet-scented herbs, lavender, thyme and mint; but differs from all of its relatives in that it yields edible tuberous roots. These are formed of ring-like ridges, so that they have the appearance of a one-horned caterpillar (see Fig. 62) and vary in length from one to three inches, and in diameter from one-half to three-fourths of an inch. The skin is thin, smooth, and semi-transparent.

This peculiar vegetable requires no more special treatment than do potatoes, and it will thrive even on poorer soil, though, like everything else, the more attention that is given, the greater and more satisfactory will be the result. Planted, a single whole tuber in a place, in hills two feet apart each way, a yield of nearly 500 bushels to the acre has been reported, each plant yielding from 200 to 300 tubers, which may be planted like potatoes, though each joint of the stem may be used as a set. The plant, growing about a foot in hight, has a round, bushy habit, having medium-sized, oval-shaped leaves, and many small, pink flowers, which in themselves are not unattractive.

As for the use of these roots, they probably will never become a staple article for the market, but may add a variety for the table in winter. When pickled alone and properly seasoned or mixed with small cucumber, onion, pepper and cauliflower pickles, they are excellent; then again, when cooked as vegetable oysters, they are delicious; or boiled, mashed and seasoned like egg-plants, they form a novel side dish, having a pleasant and somewhat spicy flavor, midway between that of the Jerusalem artichoke and boiled chestnuts. In preparing them, washing only is necessary, as the thin, tender skin renders peeling needless. A point not to be overlooked in favor of their general use and cultivation is that they may be kept as well, as easily, and as long as potatoes, requiring only a cool, dry cellar; and they keep their fresh appearance best if covered lightly with earth.

Indust'l Societies.

THE TWENTY-SECOND SESSION OF THE AMERICAN POMOLOGICAL SOCIETY.

(R. N.-Y. SHORT-HAND REPORT.)

An enthusiastic reception; valuable courtesies from all; the Sub-tropical Exhibition; re-election of former officers; Florida, the land of fruits as well as flowers; the Government and pomology; organization of the society.

THE twenty-second session of the American Pomological Society began at Ocala, Florida, Feb. 20. It was the first greeting of this time honored and influential association to the land of citrus fruits and of flowers, and the orange, the queen of fruits, flung open wide the gates of her sunny and fragrant realm to welcome her guests from the frozen North and West. Never was a body of men more hospitably received. The people seemed delighted to honor this distinguished company of American fruit-growers, and even the conscienceless railway companies were melted into surprising courtesy, as the members were given free excursions to all important points, besides being granted free transportation to all points in Florida for ten days after the close of the meeting. Without questioning motives, it is only just to say that this courtesy was highly appreciated by every visitor and was universally used. Had Northern and Western railway lines been thus kindly disposed, the attendance of members would have been much larger. As it was, only about half the States and Territories were represented in the convention. Many were deterred by the expense of the trip, and others were prevented from leaving their nurseries at this busy season.

The first business session opened at the new Semi-tropical Exposition building amid a varied and magnificent display of citrus fruits and a most interesting collection of other curious products of the South. The orange-wood gavel of President Berckmans called the members to order at eleven A. M. Rev. C. B Wilmer made a brief prayer, which was followed by an address of welcome by President Dudley W. Adams, of the Florida Horticultural Society. As a loyal subject of her bright realm, he welcomed the society to the domain of the Queen of Fruits—the orange. He referred to the pine-apple, guava, banana, lemon, pomelo, peach, pear, grape, mango and strawberry, as a bouquet of pomological aristocracy. He invited all to travel all over the State, from Ocean to Gulf, from Georgia to the Keys, without money or price. A welcoming telegram from Governor Flemming, extending the freedom of the State, was read; Mayor Garey, of Ocala, opened wide the city gates and President Wilson of the Semi-tropical Exposition, pushed aside the huge doors of that fine building, the materials of which all stood growing in the native forests here less than three months ago. To all this feast of welcome Vice-president W. C. Strong of Massachusetts, fittingly responded in behalf of the visiting society. A recess was then taken after an appointment of the nominating committee. During the interim the members wandered through the Exposition display and examined the exhibits carefully and with peculiar interest. Of these some notice will be given in another report.

The afternoon meeting was held in the Ocala Opera House, that place being more quiet and better adapted for the purpose. The biennial address of President Berckmans was then read by him. It was a lengthy, interesting and important document, containing useful suggestions and observations. Its publication in full would be of value to fruit growers. He sharply contrasted the condition of European with American fruit-growers, showing how vastly more advantageously the latter labored than the former by reason of their owning the land they tilled. He said the society had long been considered by European pomologists as the most influential of its kind in existence, its reports being quoted as models by foreign horticultural publications. Florida fruit-growers were congratulated for the honor of adding more materially to the development of the State than any other class. The Government was commended for the recognition of our pomological products in the approaching Paris Exposition. The works of the U. S. Pomological Division, and the experiment stations were also praised. The utilization of surplus fruits was still a problem to be solved in some localities, and in a measure it discouraged increased production, but the abundant supply brought good fruits within reach of those otherwise debarred from their full use, which, he argued, would in time increase the demand. The incorporation of the society has been legally effected in accordance with the requirements of the legacy of the late President Wilder, and the $2,000 he bequeathed have been safely invested entire. The society is now free from debt and has a handsome balance in the treasury. The address was received with hearty applause. Officers of the society for the next term were then elected, or rather re-elected, as the list remains practically the same as before.

Then the reading of essays began. Dr. J. C. Neal, of the Florida Experiment Station, opened with a very instructive treatise on "Cross Fertilization."

(To be Continued.)

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

"I DON'T think Nellie is very tidy," said a girl of her friend. "Her veils somehow look as if she crumpled them up and jammed them into a drawer, instead of folding them up." We think that might be said of many girls; yet it is very poor economy to be untidy. One's things get so "mussy" if thrown aside carelessly when taken off. This is especially true of veils; they ought to be carefully folded and wrapped in soft paper, or put in an envelop whenever taken off. Gloves should be stretched out, and folded flat, any loose stitches being repaired. Hats, jackets and gowns should be brushed and looked over, after each time of wearing. These little trifles make all the diff-rence between shabby attire and the reverse.

* * *

THE "men folks" have had such a good time lately discussing their varied interests in the RURAL, that we begin to think the women ought to follow their example. Why shouldn't the women have a "Special" too? Mr. T. B. Terry's manly article previously alluded to in this column, calls to mind the constant worry too many women suffer for lack of a settled household allowance or pin-money. Let us have a RURAL symposium on this subject, and hear what the women folks have to say about it. It is a matter that touches most of us, one way or another.

* * *

CLEAN, stiff collar and cuffs often brighten a shabby gown wonderfully; but for general wear nothing is better than the sensible fashion of putting picot-edged ribbon in neck and sleeves. Orange, primrose, old pink, pale blue, golden green, terra-cotta, or cardinal are all good colors for wearing thus. Ribbon thus worn saves washing and also saves trouble in dressing. It is tacked in double, but is not folded quite in the middle, so that it shows both edges.

* * *

A PRETTY German idea mentioned in Good Housekeeping is the "wonder ball" for a little girl learning to knit. All sorts of little trifles were hidden away in the ball, to be disclosed from time to time as the wool was unwound in knitting. There was a little poem, a bright new dime, a glove buttoner, a tiny booklet, a thimble, a packet of court plaster, a string of beads, a pair of doll's shoes, a packet of doll's hair-pins, and several other tiny gifts. Of course, the ball was pulled about and pinched a little at first, to feel some of the wonders it contained, but the resolute little girl to whom it was given made no attempt to take out any of the mysterious gifts before she came to them by the unwinding. This is really a very good idea in encouraging a child learning to knit, and causes much innocent pleasure.

* * *

AN amusing variation for the game of bean-bags is to use, instead of the board, a small hoop, about a foot across. This is hung in a door-way, three feet from the ground; a small bell is hung in the upper part of the hoop. The bags are to be pitched through the hoop, ringing the bell. It is a game provoking much merriment, even among sedate grown-ups. Another indoor game that gives both exercise and merriment is shuttlecock and battledore, the very thing for a stormy winter day, if there is a vacant room available. It is a time-honored game, but more popular in England than America.

THE GOAL OF HOME.

OLIVE E. DANA.

WE hear much about the childhood homes of poets and statesmen, of artists and authors. These dwellings are idolized by love and memory, till the lonely New England farm, or Western log-house, or quiet village home, loses its dreariness or dullness, in the associations it has for its children, and through them, for the world. We hear more of those homes that lay behind the men and women that the world honored than of the homes which beckoned them onward, and the winning of which was often one of the strongest of incentives to effort. Yet the latter were often as potent in their influence as the earlier. If we could know what the majority of those who are rich or famous prize most as the reward of their diligence, or as the best thing wealth or success has brought within their reach, I wonder if it would not, very often, be the comfort and the joy which they seemed to see in some setting of household delight. How many of them, after all, have realized that "Home is the kingdom, and love is the king."

It may be that their achievements were inspired by home influence, or it may be that the dream of home is realized only in later life. The ideal in either case is wrought out as earnestly. Such homes, whether the makers of them are conscious of it or not, seem to pre-figure the Heavenly City of which it is written. "The kings of the earth do bring their glory and honor into it."

Bayard Taylor dedicating his translation of Faust to his wife, likened her influence to that of the sun and rain and dew, nourishing the flower of song. He gave the soil and she the atmosphere. It is well known that the passionate desire of the poet-traveler for a fitting "poet's home", with beauty and luxury without and within, with grove and lawn and spacious grounds, led to the purchase and adornment of the famous "Cedar-Croft." And although the fulfillment of this desire brought a weight of care and toil which he was glad afterwards to relinquish, as far as possible, yet it was a wish and aim that befitted a warm, true heart like his.

It is said that even as a child, Charles Dickens "nourished an ambitious fancy for becoming the owner of the house at Gadshill. His father had told him that if he worked hard and minded his book he might one day live in such a home, and the speech sank deep into the child's heart." It was many, many years afterwards when he had become the successful novelist, and yet had not lost his boyish fancy or affection, that it came to pass that at a time when he was about to remove into the country, a friend, who knew his old desire, met at dinner a lady who wished to sell an estate she had lately inherited. Noting what was said of the place, and its strange resemblance to that for which Dickens had had so strong an attachment, the friend "found it was the very place of Mr. Dickens' boyish dreams," of which the author of Pickwick Papers became the genial and hospitable master.

It is said of Mrs. Mary Clemmer, that "one of her great ambitions was achieved when she was able to have a house of her own in Washington, with a door in the middle, and to take her father and mother to her own house." She had written of Alice Cary that "hers was essentially a feminine soul, shy, loving, full of longings for home," and had pictured the beautiful home of the Cary sisters,—perhaps the dearest tangible reward of their long, lonely life struggle. Yet that this home love and longing is not a weakness of "feminine minds," is abundantly proven. They may have finer walks, and ampler grounds, those dwellings men's brains or brawn have earned or built,—but they embody the same home ideal.

It is lately stated, in an interesting sketch of his career by Mrs. Sarah K. Bolton, that Mr. Geo. W. Childs, owner of the Public Ledger, of Philadelphia, a paper whose yearly profits have been $400,000, after fortune and fame had come, built homes, elegant ones, in Philadelphia and at Newport; "not simply places in which to spend money, but centers of hospitality and culture." The one is a city house, with a luxurious and charming library, whose wood-work is of carved ebony with gold; "with book-cases six feet high on every side, and the ceiling is built in sunken panels, blue and gold." The other is "a lovely country seat, the house in Queen Anne style, surrounded by velvety lawns, a wealth of evergreen and exquisite plants, brought over from South America and Africa." "The farm adjoining is a delight to see, the dairy built of white flint stone, with stained glass windows, as though it were a chapel." And here have been entertained Herbert Spencer, Dean Stanly, Hughes, Dickens, Evarts and Grant—"the famous of two hemispheres." James T. Fields who also won his way to distinction, was master of a home famous for its literary treasures, its souvenirs of travel and friendship, and the wise, witty, and renowned it had sheltered. The outlook from his summer home, at Manchester-by-the-Sea, is described, it is said, in one of the novels of William Black.

A PLEA FOR OUR DAUGHTERS.

S. J. L.

I THINK the next question before the people will be "What shall we do with Our Fathers." The subject as to the disposition of "Our Girls" and "Our Boys" has been (apparently) disposed of, but the subject of "Fathers" has never been broached, and yet they are an important factor as regards the domestic finances. What is to be done with the father who is perfectly willing that his daughter should work hard at home, doing all and more than a hired girl would do, and yet who is aghast at the suggestion that he

pay her regular wages, saying to himself gravely, "What can she want with money? I *give* her her board and clothes; any girl with a spark of gratitude or common sense would be satisfied." Heaving a resigned sigh, he adds "But that's just the way with my women folks; they cannot be made to see I am managing for their interest; they are working for themselves and what is saved by their labor will come to them in future years."

Now I would ask what man would contentedly work year after year, his clothing bought for him without consulting his wishes, never allowed to use his own judgment in selecting implements to work with, not a cent in his pocket to gratify a wish, but buoyed up by the knowledge that when he was too old to enjoy it, he would then reap the benefits. Men would consider that tyrannical, but they can look upon a daughter taking that part with conscientious fortitude little realizing to what wells of humiliation they consign her. It reminds me of an adopted daughter—a faithful and reliable worker—being magnanimously presented with $5 at Christmas time, for the purchase of gifts, accompanied by a list of what things to give and to whom to give them, leaving out a dearly beloved aunt, and giving presents to those where they would make the most show. And those people felt that they had been gloriously generous!

Give your daughter an interest in her work; show confidence in her ability to exercise common-sense, and you will be surprised at the rapid development of self-reliance and judgment. Never hesitate to trust your daughter with household expenses: if you put confidence in her she will reward you with faithful service.

How is a girl to have judgment if you do not trust her? How is she to fill the place of wife and mother if she is entirely ignorant of the personal distribution of money?

A girl who has a dollar in her own pocket is far happier than the one who earns two dollars kindly kept for her future use by a philosophic parent. In security there is rest, and I know of no feeling that is more restful than the security of having a few dollars of your own in your purse to do with as you please. A settled sum, small though it may have to be, that will enable her to make calculations as to its distribution, will engender great tranquility of spirit, and do away with that uncomfortable balancing upon that point between hope and despair. It is a question of right and wrong, and may all fathers keep to the right!

GOLDEN GRAINS.

CHAPIN offers consolation in the truth that out of suffering have emerged the strongest souls; the most massive characters are seamed with scars; martyrs have put on their coronation robes glittering with fire, and through their tears have the sorrowful first seen the gates of heaven.....

SOMETIMES, says Spurgeon, a fog will settle over a vessel's deck, yet leave the topmast clear. Then a sailor goes up aloft and gets a lookout which the helmsman on the deck cannot get. So prayer sends the soul aloft; lifts it above the clouds in which our selfishness and egotism befog us, and gives a chance to see which way to steer.....

THE CONGREGATIONALIST gives pertinent advice when it says that there is hardly a person who cannot be drawn into church, sooner or later, by being studied attentively, approached in a friendly way, and followed up as opportunities occur.....

THE woman who has found a man to whom she can be an inspiration, making him toil easily and happily for her sake, has found the widest possible sphere. The instincts of every woman lead her to seek this; whatever else women seek is probably sought because they have been denied or disappointed in finding this.....

Be sure, no earnest work
Of any honest creature, howbeit weak,
Imperfect, ill adapted, fails so much;
It is not gathered as a grain of sand
To enlarge the sum of human action used
For carrying out God's end.
I count that heaven itself is only work
To a surer issue.
Let us be content in work
To do the thing we can, and not presume
To fret because it's little.
—*Mrs. E. B. Browning.*

THE little dwarfed flower that springs into life in the crevice of some rock, shut in from sun and rain, grows struggling toward the light, and as it withers gives forth a perfect seed, which the winds bear to more favorable soil. So it is that the influence of a word may not be felt by the nature on which it falls, but its spell may be borne to a more yielding heart, and there blossom in gladness.

WHAT greater compensation can be asked for a life of devoted well-doing, than the glory that it imparts to the dying hour, as the traveler looks back upon the way he has come?.....

A LITTLE girl died here a few years ago, and, as her mother held her wrist and noted the faint and flickering pulse, a smile came to the wan face and the child whispered: "There is no more desert here, mamma, but all the world is full of flowers." A moment later the smile became transfixed.....

IN an Eastern city, not long ago, a Sister of Charity was dying, and at last from a stupor she opened her eyes and said: "It is strange; every kind word that I have spoken in life; every tear that I have shed, has become a living flower around me, and they bring to my senses an incense ineffable."....

PURE words in unclean surroundings are like the beautiful lilies that grow up straight and tall beside a stagnant pond, with their beauty reflected in its sluggish depths .....

ONE of the happiest faculties a human being can possess is that of looking upon the bright side of everything, and when Tom Moore wrote

This world is all a fleeting show,
For man's illusion given:
The smiles of joy, the tears of woe,
Deceitful shine, deceitful flow—
There's nothing true but heaven!

he certainly was looking upon the dark side of everything: he had a decided "fit of the blues," which tinged all things with the same sombre hue, and, the worst of all, made a sad mistake; for this world is as true as Heaven, if we but make it so.....

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

EXTRACTS FROM SUNDAY EVENING TALKS.

THE MAN WITH THE UMBRELLA.

(By a young lady of eighteen.)

STANDING on the wharf of a commercial city of the Connecticut, one afternoon, watching the steamers pass up and down the river, and looking across the meadows, dotted with farm houses, we became almost unconscious listeners to a conversation going on near us. A sea captain who had given over the dangerous calling he had loved, for a quiet life among the luxuries of his home, and his family, was recalling, for a friend, many a reminiscence of his earlier years. And among other things, he told how he had learned to carry his ship successfully to and fro, along the southern Atlantic coast, even in the most stormy and foggy weather.

"I never made a trip," said he, "in which during all the clear weather, I was not studying every rock, and headland, and island and sand-bar on the coast, and from each I drew angles with my eyes, until by gaining the slightest glimpse of a light or a bit of land, I could tell precisely in what direction and how far from it I was, and therefore, precisely what point I was opposite. I soon grew so familiar with my own angles and my mental chart of that coast, that I felt as sure of my course in the darkest night and the foggiest weather as on a sunny day."

"In short", laughed his friend, "you always carried your umbrella with you when the sun shone, and so you were always prepared for a storm."

And there is an immense amount of practical truth in that last remark, if one only stops to consider it. The man who carries his umbrella when the sun shines, is indeed always prepared for the storm. The incident related by the sea captain recalls to my remembrance, a dear, good man, a city missionary of that same city, who never left his home on his round of daily visits without taking with him his umbrella. When the sun shone down upon the paved street with a sultry glare, he sheltered himself beneath the brown canopy of that trusty friend, and when sudden showers came plashing down, he calmly pursued his way, protected by his unfailing companion.

We girls,—that means the irreverent speaker and as irreverent a friend—used to make all manner of fun of the dear parson; we dubbed him Paul Pry and familiarly spoke of him as the man with the umbrella. But, ah! how many a dying bed has been cheered, how many an outcast gathered into a sheltering fold, how many a hungry family fed and clothed, how many a Sunday-school founded, how many a chapel built by that man with the umbrella, or through his tireless effort; and for all our nonsensical jesting, I doubt if he could have accomplished half the immense amount of good he did, were it not that he was always prepared for the storms.

And, metaphorically, how many of us go through life carrying umbrellas while the sun shines? Youth and health and prosperity all represent sunshine; but do we carry an umbrella while we are young and healthy and prosperous, that we may be prepared to meet the ills of life, however suddenly they may overtake us? While we are young, are we fitting ourselves to resist temptation, to support ourselves under all circumstances? While we are well, are we strengthening our muscles, developing our constitutions to their best extent, laying by stores of health, good habits, and temperance principles for coming seasons? While we are prosperous, are we saving up for rainy days; are we doing good, and helping others and cultivating self-denial and thrift? Many a young man, had he carried an umbrella when the sun shone, when the storms of temptation came would have been saved from their fury—would have been saved from ruin and death. Many a young woman, had she cared about her health when she was healthy, would have been saved years of invalidism. Many a family, had they practiced thrift and economy when they were prosperous, would have remained unharmed during the hard times instead of being reduced to penury.

After all, the man with the umbrella, either in a metaphorical or literal sense, is not to be despised. When we are caught in a drenching shower, we do not despise any proffered share of it. Indeed, we wish we had been Paul Prys ourselves, to the extent of carrying a protection against the rain, even before the rain set in. But if our pride results in occasional damage to our dry goods, pray do not let our inclinations run away with our common sense, and prevent any young man or young woman from giving serious thought to the fact that he or she who strives in youth to be strong, healthy, learned, virtuous and independent, honest and honorable, is the one who will not make shipwreck of life in coming years, but by having carried an umbrella in the sunshine, will have been provided for and protected in every storm of temptation and under all circumstances.

A SHINGLE SOCIAL.

THE president of the Ladies' Church Social Society and the vice-president were consulting together to decide who should give the next social. The church used its pleasant chapel for its social gatherings. At one end of it were three small rooms, one of them fitted up as a kitchen and the other two with sliding doors that could be opened so as to make the two rooms parts of the main room.

The Social Society owned a cooking stove and a closetful of dishes, and giving a social was not so great a drain upon the resources of those who gave it, as it had been before the chapel was built and its kitchen stocked and furnished.

So when the consultation of the heads of the society resulted in the choice of ten young ladies to give the social, they could not refuse, though, in truth, more than one at first wanted very much to be excused. A bright, new carpet was to be laid in the chapel and the social would be the occasion of its first public appearance. This made the event a special one and the committee soon became interested in making the social the best of the season. They met and discussed meats, bread, sugar, cream, coffee and fruits, their prices and their fitness, and, after much talking, settled that the meats should be roasted ham, sliced cold, and chicken salad; that there should be white and brown bread and baking-powder biscuits, canned pears and jelly for the fruit, and cucumber pickles. Coffee, cream, sugar and tea must be furnished besides. No cakes or rich sauces would be furnished, for the refreshments were to be served from six to seven as a plain supper, and as the admittance would be only 10 cents it was thought that many would come to the social without their suppers, knowing a light, wholesome meal awaited them there When it had been settled who would furnish the eatables, one of the committee suggested that a wide shingle given each one who came to supper, would be very convenient, as it would be long enough to hold a plate, a coffee-cup and a sauce dish. The plan was decided upon, and the shingles were engaged from a lumber merchant in the town. The girls on the committee then told their friends that the entertainment was to be a shingle social, but they would give no explanation of the name, and much funny surmising went on outside the committee circle. The brothers of the girls on the committee had been invited to become working members of it, and one and all responded with hearty good-will and practical help.

The morning of the day set for the social they all met to bring together the provisions and to get a table ready in the little room next to the kitchen where everything was to be arranged, so that the waiters need not go to the kitchen for supplies when their time for action came. A little window between the kitchen and this room made it a very convenient place to set the table. Great dismay fell upon the committee when the ham was cut into, for it was found to be spoiled at the bone, and entirely unfit for use, and a chorus of cries arose, from the first exclamation "It's spoiled!" through all shades of dismay and disgust, to a vigorous order to take it out of doors, "It is scenting the whole place!" And the offending meat was carried into the yard, covered with a basket and a stone was laid on the basket to prevent any stray dog from appropriating the dainty morsel. Then the question was discussed, "What shall we have instead?" Salmon, sardines, boiled tongue, beef loaf, dried beef, and scalloped oysters were discussed in turn, and at last hot scalloped oysters were decided on. Three of the committee were each to do a share of the preparing and baking, and bring them as soon after five o'clock as possible, when they would be kept hot in the oven of the chapel cooking-stove.

The young lady who suggested having the shingles, prepared badges for the committee and for all who were to help them to wait on the—not tables—shall I say wait on the shingles? These badges were miniature shingles with the word lettered on them, which indicated the duty of the wearer. The girls who took the fee at the door had "dimes" on their badges; "plates," "bread," "salad," etc., were lettered on others and the wearers had only to fulfill the one duty specified by their badges. Two young ladies wore badges of welcome, and they received every one with a cordial greeting and directed all to the third little room where wraps and hats could be laid aside

A little after six the pile of shingles and Japanese paper napkins were distributed and the merriment the former caused drove away any vestige of stiffness that may have lurked among the company. The room filled very fast and by seven o'clock a busy hum from more than 100 animated voices assured the committee that the social was proving a success. The bread, the coffee, the oysters—everything held out "just beautifully," as one of the providers expressed it, and the fear that something would be used up while it was still in demand, vanished. To be sure, there was no chicken salad left for the committee when they ate around the big table after every one else had been served; but there was plenty of everything else and more than enough of the scalloped oysters.

Nearly 150 had been served and there were still some things in the chapel kitchen. Seven loaves of white bread had been provided and eight of brown, 100 biscuits, about six quarts of chicken salad, six quarts of pears, four glasses of jelly, three pounds of coffee, four quarts of cream, four pounds of sugar and about four of butter; and six quarts of oysters were used for the scalloped oysters.

When the supper was over, the sexton's wife, who had been an able helper all the afternoon and evening, took charge of the dishes and returned them clean and shining to their cupboard.

The committee were free to enjoy the social features of the evening and as they moved about among their friends they stopped occasionally to give each other little congratulatory smiles and nods, or to say in a happy under-tone, "It *is* a success; isn't it?"

ALICE BROWN.

WHY FRET.

WHAT'S the use in fretting? Some people go around with a perpetual pucker between their eyebrows—a constant frown on their brows; and what good does it do? Did fretting ever cure any evil? No, never in this world. I don't say, What's the use in caring? One *must* care; one must have life's work at heart enough to think about what is the best to do—but to fret, fret, fret, from morn till eve, just because things don't suit you, won't make them suit you a bit better than if you didn't fret. When things are unsatisfactory, first find out the cause. If you can remedy it in anyway, go to work man-

Miscellaneous Advertising.

When Baby was sick, we gave her Castoria,
When she was a Child, she cried for Castoria,
When she became Miss, she clung to Castoria,
When she had Children, she gave them Castoria

fully (or womanfully) to bring about the desired remedy. But if you find you cannot accomplish what you wish, will fretting avail you aught? Remember that

"For every evil under the sun,
There is some remedy—or none.
If there be one, resolve to find it—
If none, submit and never mind it."

It is not always easy to "never mind it," but if it is inevitable, we *must* submit. Sometimes it seems hard and bitter—sometimes the burden given us to bear seems heavier and greater than we can bear, but does fretting lighten it? Ah no! It only adds care to those around us, and lifts the weight from ourselves not one whit. While we struggle against the inevitable we become tired and weary with the struggle and so become unfitted for anything. It is like a caged bird dashing its head against its iron bars. Does it help the poor tired thing to freedom? On the contrary, it only weakens and prostrates, so that, if freedom should at last come to the caged creature, it would not be able to avail itself of the longed-for boon.

"Another rainy day! I hate rain! And it is always raining!" How often we hear such exclamations as these. (And let me whisper—How often I grumble so myself!) Do you suppose there are many people who love rainy, cloudy, muggy weather any more than you do? Do you suppose your constant fretting about said rains and clouds makes your companions more cheerful over the weather? It is selfish to fret. If we are unhappy, does it make us happier to make those around us miserable? If you have nothing else to do, you had better go at once and hunt some work that will keep you busy, for those who are busy don't have time for fretting. "Do with your might what your hands find to do." Enter heart and soul into your work and by and bye you will outgrow the detestable habit of complaining. As I've said in the RURAL before—don't go poking around in some dark hole in search of a spook of some sort to haunt you; for when a *bona fide* ghost is ready to come, he'll not need any "poking" after—he'll walk right out and face you. Life is filled with thorns, some of them very sharp—some of them seem to pierce our very souls, but are there not also roses?

"There's never a thorn without a rose," said some one (I'm sorry I can't say who) in reply to a pessimist who was complaining that there was "never a rose without a thorn." That seems to me to be the best way to look at things.

Some fret because it is cold, or because it is hot, or because it is wet, or because it is dry. Does fretting alter it any? No. Then what does it do? It makes us ill-tempered and disagreeable. It makes those around us, whose lives we ought to brighten, far more unhappy than they otherwise would have been. If we have an unfortunate nature that makes a mountain of every mole-hill, let us try and keep our "mountains" to ourselves, and not shift the weight of them on everybody who comes in contact with us.

"How easy it is to spoil a life—
And many are spoiled ere well begun—
In some, life darkened by sin and strife,
Or downward course of a cherished one;
By toil that robs the form of its grace,
And undermines till health gives way:
By the peevish temper, the frowning face,
The hopes that go and the cares that stay.

"A day is too long to be spent in vain;
Some good should come as the hours go by—
Some tangled maze may be made more plain,
Some lowered glance may be raised more high.
And life is too short to spoil like this—
If only a prelude, it may be sweet.
Let us bind together its threads of bliss,
And nourish the flowers around our feet."

Has it been another sermon? Well, I am preaching to myself as well as to you, for I fear the seed of discontent has taken pretty deep root in my garden patch. But I am fighting to keep it from yielding a large crop.

DORA HARVEY VROOMAN.

HARPER'S BAZAR would remodel a black silk dress in Directoire fashion in this way: Cut off the back of the basque in a blunt point, and have the fronts short like those of a round waist. Over the front add in the shoulder seams, and under the arms a short square-cornered jacket cut off straight at the waist line, and extending up to the highest point of the shoulder seams, where it must turn back in short revers made double, and the edges below are then widely faced all around to the side seams. Under this jacket front place a full vest of black net wrought with gilt figures, gathered to the standing collar of silk. This net is costly, but it is very wide and only a quarter of a yard is required for the vest and for trimming the sleeves. The vest disappears below under an Empire sash of the silk, which may be in wide wrinkles straight across at the waist line, or else it is in diagonal folds, being much higher on the right side than on the left. The sleeves are over an easy coat-shaped lining of silesia or satteen, but are cut three or four inches longer at the top than the lining, and are slightly wider there, so that the added silk can be laid around the arm in easy, careless folds—not set on stiff—and pushed up high above the arm-hole. At the wrists a slightly flaring cuff is added of the silk doubled and interlined, and is turned back, with its opening on the inside or the outside of the arm, as the wearer chooses. Below this cuff, coming out from inside the sleeve, is a puff finished with a narrow ruffle of the black and gold net. The skirt has four straight back breadths partly gathered to the middle of the blunt point of the waist, then laid in pleats toward the sides. Tapes underneath across these breadths hold them in place. The front of the skirt has a slightly draped tablier of two or three breadths, or else it is pleated at the top and finished with a Spanish flounce below.

AGREEMENT.

SOME ten years ago, in gathering grasses for winter decoration, I chanced upon a tuft of ferns with very small leaves; these I gathered and pressed in a large book, and some of them are there now. Whenever I open that book the room is filled with a delicately sweet odor from those pressed ferns. Their color is as fresh as if it were only a few weeks since they were gathered, instead of ten years.

The incident was recalled to me upon reading "Sweet Fern's" letter in the RURAL of February 9. Being of the opposite sex, I suppose I have no business meddling in the department claimed by the women, but allow me to thank the writer for her sensible and practical letter. There are too much theorizing and too little practical economy displayed by many who write for the delectation of themselves and the guidance of others. A good wife, in my estimation, will look well to the ways of her household, caring for her loved ones, and causing each member of her family to regard home as the dearest spot on earth. A true woman will continue to increase in attractiveness to her dear ones as the years go by, even though they bring lines of care to her face, and old Father Time slowly deprive her of youthful personal graces. Some aged ladies of my acquaintance have in their fullness of years a charm that I am sure they never possessed in "the auld lang syne." In consciousness of duty done, they placidly wait the coming of the time when they shall pass through the shadowy vale to the "beautiful home beyond," when they shall put on a glorious immortality. A MAN.

NOTES.

THE new shade of green is so glaring that it will require the complexion of an angel and the courage and strength of a Hercules to wear it—so says one of our fashion chroniclers.

THERE are not less than 1,500 women who are regularly enrolled as art students here in New York. They come from every State in the Union, many of the Territories, Canada, Mexico, and South America—and one comes from Japan.

THE "horrible hump of deformity," as Annie Jenness-Miller calls the bustle, is gradually growing smaller. In the latest and most fashionable gowns the reeds are omitted. Still, it doesn't seem as if we could do away entirely with the bustle. D. H. V.

BREAKFAST AND LUNCHEON CAKE.

THE following seems so well adapted to the breakfast table, that I, who have a weakness for cake at breakfast, often give it a place there. It is also nice at luncheon, and is well liked by the men-folks when work necessitates "carrying dinner."

THICK CAKE.

Two cups of sugar, one cup of unmelted shortening, mix, add one tea-spoonful of salt if the shortening is fresh, two cups of sour butter-milk, nutmeg or other flavoring, and one tea-spoon, rounding full, of saleratus dissolved in a spoonful or two of warm water. Use sufficient wheat flour to form a dough as soft as can be easily handled. Roll out from one-fourth, to one-half inch in thickness, cut any size desired (the edge of a tea-cup or the top of a tin pint can is a good cutter) place the cakes close together in buttered tins and bake in a quick oven. If granulated sugar is used, one-fourth to one-half cup less in measure may be taken.

Fried cakes, ginger cookies, and gingerbread, are sometimes liked at breakfast.

MOTHER'S FRIED CAKES.

ONE heaping cup of sugar, one and one-half-cup of butter-milk, three or four table-spoonfuls of melted shortening, one scant tea-spoonful of saleratus dissolved in a table-spoonful or so of warm water. Nutmeg. Flour to make a middling but not too stiff dough. Roll about one-half inch thick and cut into strips half an inch or so wide and six or eight inches long. Double and twist to form a sort of a half-double figure 8, and fry in hot lard.

SISTER MARCIA'S FRIED CAKES.

THREE rounding cups of sugar, one pint of butter-milk, four or five table spoonfuls of fried meat gravy, one level tea-spoonful of salt and one tea-spoonful of saleratus in warm water enough to dissolve it—cinnamon or nutmeg and flour sufficient to roll out. Cut the dough to any form desired and fry in hot lard.

GINGER COOKIES NO. I.

ONE-FOURTH of a pound of butter, one cup of sugar, one-half cup of sour cream, two cups of molasses, one egg (that may be omitted, using a trifle more saleratus if eggs are scarce), a pinch of salt, a spoonful each of ginger and cinnamon, one heaping tea-spoonful of saleratus dissolved in a spoonful of warm water. Flour to form a dough as soft as can be easily rolled.

GINGER COOKIES, NO. 2.

ONE cup each of sugar, molasses and butter (lard or fried meat gravy may be used instead), one egg, or none, as preferred, one table-spoonful each of ginger and vinegar, and one table-spoonful of saleratus dissolved in a little warm water. Cinnamon or not as you like. Flour to form not too stiff a dough.

If these are too "rich," try "Christie Kriss," ginger cookies without shortening. They are good. Two cups of molasses, a tea-spoonful of soda and one of salt, an even tea-spoonful of ginger and other spice if desired, and flour enough to roll easily.

GINGER-BREAD.

ONE tea-cupful each of butter and butter-milk, three tea-cupfuls of molasses, one table-spoonful of ginger, one table-spoonful of saleratus dissolved in a spoonful or two of water. Mix with wheat flour to form a dough as soft as can be handled. Put it in three long pie tins, mark the top of each in bars, crosswise, and bake.

Encouraging Evidence.

In matters relating to Compound Oxygen to which we call attention so frequently, you are asked simply to judge by evidence. Other affairs of practica existence, which proceed on this basis have no difficulty in the way of adjustment, no more do our claims for Compound Oxygen.

We are helped over obstacle by such impetus as the following afford :

PRINCE'S BAY, N. Y., April 1, 1887.
"My wife had neuralgia going from head to heart, sick all the time night and day for several years. Used two home treatments of Compound Oxygen and in less than three months she was fully relieved."
J. W. ANDROVATT.

BEWLEYVILLE KY., November 21, 1886.
"I write to inform you of my health and good feelings towards you as helpers of the afflicted ; have not had a severe cold since I have been under the Compound Oxygen treatment." MRS. ETHEL H. COX.

LARKIN, W. VA., July 31, 1888.
I must say your Compound Oxygen has done me much good. You may use my name in any way you wish. REV. T. F. HOLT.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery St., San Francisco, Cal.—*Adv.*

LIVE STOCK MARKETS.

NEW YORK, SATURDAY, March 9, 1889.

BEEVES.—Dressed beef at 5@6¾c per lb for sides.

MILCH COWS.—Receipts for the week thus far are 117 head. The market has ruled dull at $25@$40 per head, and Inferior stock has sold as low as $22. Now and then a Choice or Extra Cow goes to a private customer at $45 or $50.

CALVES.—Steady; 4½@7c per lb for veals and 2½@3c per lb for western calves.

SHEEP AND LAMBS.—Common to Choice Sheep sold at $4@$5 75 per 100 lbs, and 1 carload of Extra do at $6 05, and lambs at $5 50@$7 25. State sheep, 91 lbs average, at $5 30 per 100 lbs; Ohio do, 85 lbs, at $4 75; do, 81 lbs, at $4 87½; do 83 lbs, at $5 25; Michigan do, 88 lbs, at $5 30; Western do, 97 lbs, at $5 10; Ohio lambs, 83 lbs, at $7 25; Michigan do, 80 lbs, at $7; Western do, 74 lbs, at $6 62½.

HOGS.—State Hogs, 194 lbs average, at $5 per 100 lbs' Common to good are nominally quoted at $4 80@$5 20.

EXTRAORDINARY LICENSE.

"IT seems to me," remarked one of our citizens the other day, "that physicians are allowed extraordinary license in the manner in which they juggle with the welfare of their patients."

"Now here is Dr. —— who was attending Mr. —— up to the time of his death, and if he treated him for one thing he treated him for a dozen different disorders. First, the doctor said pneumonia was the trouble; then it was consumption. Then the patient was dosed for heart trouble, and so on until just before he died it was ascertained that disease of the kidneys was the real trouble, and that which had been at first treated as pneunomia, consumption, heart disease, etc., were but the symptoms of kidney disease.

"But then it was too late."

"This is only one case in a hundred, and I am beginning to lose faith in the doctors altogether. In fact I haven't had any need for their services since I began to keep Warner's Safe Cure in my house, a little over three years ago. Whenever I feel a little out of sorts I take a few doses of it, confident that the source of all disease is in the kidneys, which I know Warner's Safe Cure will keep in good order, and will eradicate any disease that may be lurking there. Had Mr. —— followed a simliar course, I have no doubt that he would be alive to-day; but, of course, all people don't think alike."

"One thing is certain, however, and that is the doctors are allowed a little too much freedom in the way they have of pretending to know that which they really know nothing about. If they don't know what is the real trouble with the patient, they should admit it and not go on and experiment at the cost of the patient's life."

For rates on the TRY ME, the *best* hand lever Feed Cutter (3 sizes), ad's G. S. GARTH, Mill Hall, Pa.—*Adv.*

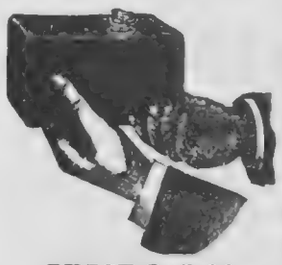
A COMMON MISTAKE in butter making is carelessness in selecting and using artificial color. The best on earth is none too good. Use Thatcher's Orange Butter Color and you have it right every time.—*Adv.*

The Kodak.



PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be re-loaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker.

The Eastman Dry Plate and Film Co.

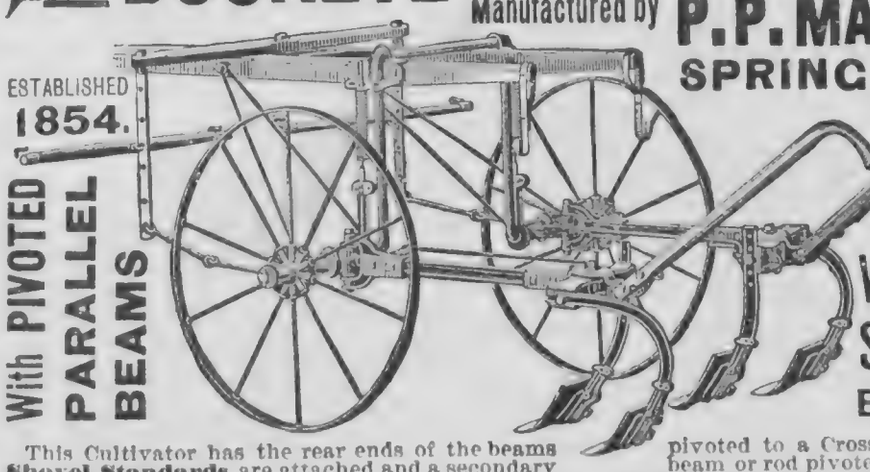
NEW BUCKEYE SUNBEAM CULTIVATOR
Manufactured by **P. P. MAST & CO.**
SPRINGFIELD, O.
ESTABLISHED 1854.



With PIVOTED PARALLEL BEAMS
With METAL WHEELS and SPRINGS at Ends of Beams.

This Cultivator has the rear ends of the beams pivoted to a Cross-head to which the **Shovel Standards** are attached and a secondary beam or rod pivoted to the coupling in front and to the Cross-head in the rear, by which the Shovels are carried parallel with the axle, whatever may be the position of them in being moved sidewise. The spring at the front end of the beams supports them when in use, and enables the operator to move them easily from side to side and assists in raising when he wishes to hook them up while turning at the end of the row. We attach these Beams also to our **Riding** and **Tongueless Cultivators.** This Cultivator has no equal in the market, and can not fail to be appreciated by any farmer who sees it. We also manufacture the
BUCKEYE DRILL, BUCKEYE SEEDER, BUCKEYE CIDER MILLS AND HAY RAKES.
Branch Houses:—**Philadelphia, Pa.; Peoria, Ills.; St. Paul, Minn.; Kansas City, Mo.;** and **San Francisco, Cal.** ☞ Write for Circular to either of the above firms or to

NEW LONDON, CONN.

CONTINUED VICTORIES.
THE COOLEY CREAMER
AGAIN PROVES ITS
SUPERIORITY OVER EVERY OTHER APPARATUS
AS A CREAM RAISER AND SEPARATOR.

The **ANALYSIS** of the **SKIMMED MILK** at the Granite State Dairymen's Association's Annual Meeting, Jan. 8th-10th, shows that the **COOLEY CREAMER** got the cream from the milk the most thoroughly, the next nearest competitor had 12¼ per cent. more butter fat left in the skimmed milk. The **CENTRIFUGAL SEPARATOR** had 32⅛ per cent. more butter fat left in the skimmed milk, proving conclusively that the **COOLEY CREAMER** is the best **Cream Raiser** or **Separator.**

This agrees with test made by the committee at Amherst, Mass. Creamery in Oct., 1882, when the skimmed milk from the **COOLEY CREAMER** analyzed by **Prof. Goessmann** of MASS. AGRICULTURAL COLLEGE showed that the **COOLEY SUBMERGED CREAMER** was the best **Cream Raiser** or **Separator.**

Also with **Prof. Short,** of WISCONSIN AGRICULTURAL COLLEGE, who tells the Farmers of his state: **"Submerged setting of milk is preferable to any other system;** as, if the milk is submerged promptly as soon as drawn from the cow, and the water kept cold, it produces more cream than by any other process, and prevents contamination by any impurities in the atmosphere."

The above confirm all public tests.

The **COOLEY CREAMER** always shows that it extracts the cream from the milk **more thoroughly** than any other apparatus, and consequently makes the most butter. **SEND FOR CIRCULARS GIVING FULL PARTICULARS.**

ALLEN WILSON, Suffield, Conn.

WARNER'S Log Cabin Remedies—old-fashioned, simple compounds, used in the days of our hardy forefathers, are "old timers" but "old reliable." They comprise

Warner's Log Cabin Sarsaparilla,

"Hops and Buchu Remedy," "Cough and Consumption Remedy," "Hair Tonic," "Extract," for External and Internal Use, "Plasters," "Rose Cream," for Catarrh, and "Liver Pills." They are put up by H. H. Warner & Co., proprietors of Warner's Safe Remedies, and promise to equal the standard value of those great preparations. All druggists keep them.

Literary.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD.

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

THE women looked indignantly at the intruder. Some of the men laughed, while others showed a disposition to drive the woman away, but Jack Gray rose from his seat, and helped her to the rear bench.

Little Mamie saw Mr. and Mrs. McKelvey and the baby in front and started to run to them, but seeing her mother left alone, came back and nestled up at her side. The woman placed her arm about the little girl, and sat with her head bent down as if to hide her shame.

I think the minister recognized her at once. He turned as white as snow, and dropped his manuscript on the floor. Recovering himself with an effort, he bowed before the altar, while the choir sang "Rock of Ages." The congregation thought he was praying, but I do not think so, for prayer would have brought forgiveness to his heart. He rose at last with a stern look on his face. He would not forgive her!

He came forward to the board desk and began his sermon in a voice that somehow had a clear ring in it. His face was white, but his voice never faltered, his hand never trembled.

The sermon would have been well received in Boston or New York, but it went very wide of the Drum Lake mark. Even zealous Mr. McKelvey nearly went to sleep in spite of his tight coat. No one knows how the wretched woman at the back received it, for her face was hidden. She trembled at times, but that may have been because of her weakness.

There is but one passage that I shall quote, and that perhaps has not much to do with the text. It might possibly have been effective in the hands, or rather the mouth of a more accomplished orator, but as it rolled from the lips of the Rev. Mr. Grayling, it seemed by some subtile chemical agency, to acquire sufficient narcotic properties to produce sleep.

"This life of ours, my friends, religious and social, its victories and its defeats, is not unlike the campaign of an army. We begin our real life, we go from college, or from preparation of any kind, with grand hopes of success It is like the army marching away to battle. Down through the crowded streets they go in bright, new uniforms, with flags waving, and inspiring music to lead them on. Up above them on the balcony, lips they love are trembling; eyes they would die for are filled with tears; hands that somehow hold them away from wrong, are waving them a last farewell. Their hearts are filled with courage; could they but meet the foe then, how complete would be the victory! But all these sentiments do not win the battle. It is the slow, monotonous drilling till a man is changed into a machine, the weary marching through rain and mud, the digging in the dismal trenches, it is *preparation*. It is the walking on the lonely sentry beat, when the thoughts of home come like the moonlight streaming through the pines. It is vigilance. It is the power to obey. Sometimes we fail in spite of years of preparation, in spite of watchfulness, in spite of years of devotion. We know that success is impossible, and yet we fight on, we know not why. Is it not because we feel that to the meanest, humblest, saddest life some mighty joy, some wondrous good may come?"

The minister finished at last, and sat down in his chair. The congregation began to stir, and make ready to go away. At the signal from the minister the "Chase gals" rose to sing the last hymn. It was Miss Mary's favorite, "Whiter Than Snow," and she meant to make it the best of the service.

They sang the first verse and then began the refrain.

"Whiter than snow,
Whiter than snow,
Wash me and I shall be
Whiter than snow."

They had sung but two lines when a wild cry from the back of the room, startled them into silence, "Sarcy Sal," who had struggled with her feelings, in silence all through the sermon, now threw both arms into the air with an awful cry: "My God, what can I do?"

The minister covered his face with his hands. He did not leave his place, nor did he look at the woman; but Mrs. McKelvey handed the baby to her husband, and ran to the side of "Sarcy Sal." She raised the wretched woman, and half carried her through the crowd of men, down stairs to the kitchen.

The song was finished, the minister with trembling lips pronounced the benediction and the congregation went stamping away. The Rev. Mr. Grayling waited until all the rest had gone, then he went slowly down to his own room.

He had hardly closed the door, when there came a light tap, and Mrs. McKelvey looked in. There were tears in the good woman's eyes, and her mouth worked in spite of her efforts to control it.

"She wants to see 'e Parson," said Mrs. McKelvey. "Jest fer a minnit; jest to say a few words—poor critter she can't live much longer," and Mrs. McKelvey's apron went up to her eyes in spite of all her efforts to keep it in place.

The minister drew himself up as he had not done before. There was a determination in his voice which startled Mrs. McKelvey. "You may send her away Mrs. McKelvey. I will never see her again."

Mrs. McKelvey went away without a word, but a moment later another step came along the passage. The door was opened and "Sarcy Sal" herself stood looking in. She held out her hands appealingly to him, but he turned away from her that she might not see his face.

"Henry," she whispered, "I have come to ask you to forgive me before I die. Will you not take that one stain at least out of my life? I know what I am, I know I have to die, I know you hate me, but please forgive me, Henry." Her arms were held out all the while, and her eyes were full of tears.

The minister shook his head. He did not dare to speak to her; he was afraid the old feelings would come back.

There was something in his manner that told her there was no hope, so she did not beg again. She was now only the hopeless, desperate, abandoned woman.

"Yer won't, eh?" she said with a wild laugh. "Yer a pretty Parson, ain't ye? Can't do what ye preach others ter do. A pretty Parson! Yer all alike. I'm glad I ruined ye; I wish I could do it again," and with another wild burst of laughter she went down the passage,

A moment later he saw her from his window, walking with unsteady steps down the street, with the little girl holding her hand.

The minister waited in his room till dinner was nearly ready. Then he went out in the sitting-room. Somehow, his own room seemed close and stifling. Quite a number of the boarders were gathered together, apparently discussing the sermon. Jim Foster considered it his duty to communicate the views of the company to the little man.

"Ye done well, Parson," he said, as he brought his chair up to Mr. Grayling's. "Ye done yerself proud, an' set up a big thing, but I'll tell ye one pint whar ye cud improve." Jim was like Iago, "nothing if not critical." "Ye don't throw yerself nigh enough. Ye wanter wake up an' pay fer yer lodgins. They wuz a Parson come up here last year, an' he preached it off so that yer might hev played a game of cards on his coat-flaps. That is what tells, Parson."

Before the Parson, could digest this wholesome criticism, Mr. and Mrs McKelvey rushed in from the kitchen.

"They's some trouble down town, boys," said the landlady, "I 'av 'eered the crowd yellin' and seen 'em running by. There they goes now."

Jim Foster ran to the door. Three men were running at full speed up the street. "What's the row?" called Jim.

One of the runners shouted back without stopping: "They're havin' some fun with Sarcy Sal; come on!" Jim and the rest caught up their hats, and ran at once for the scene, nearly tumbling over poor little Mamie who ran in at the door and crept into Mrs. McKelvey's arms. "Mamma! Mamma!" she sobbed, as the good Englishwoman drew her up to her breast.

The Rev. Mr. Grayling walked slowly back to his room, and took his hat from its nail. He then came back to where Mrs. McKelvey sat.

(TO BE CONTINUED.)

AN OPEN QUESTION.

IS HARRISON A DESCENDANT OF POCAHONTAS?

It is popularly believed that President Harrison is descended from Pocahontas and from the Parliamentary soldier and regicide General Thomas Harrison, who was executed in 1660.

Pocahontas, daughter of Powhatan, manifested a friendliness for the early white settlers of Virginia when she was but a girl. The story of how she saved the life of Captain John Smith, who had been captured and condemned to death by her father—how she, on several occasions, made known to the settlers their danger when about to be attacked—is well known to all acquainted with the early history of America. Her subsequent marriage with John Rolfe, an Englishman—her removal to England, where a son was born, from whom numerous wealthy families of Virginia claim descent—is the basis of the opinion that President Harrison is one of her descendants.

Whether this be true or not it is, however, well-known that President Harrison is a descendant of a noted family, distinguished alike in peace and war. The name of Harrison is already indelibly written upon the pages of American history, for General Wm. Henry Harrison—the ninth President of the United States—was the grandfather of Gen. Ben. Harrison.

The election of another member of the Harrison family is but another proof of the prevailing disposition of the public to return to healthy administration of public affairs so characteristic of the earlier years of government. A similar desire has been manifested for a revival of early manners and customs in many various ways, of which mention in particular can be made of the prevailing demand for those old-time preparations which were so successfully employed in the prevention and cure of the ills and ailments which frequented the early log-cabin homes.

After much inquiry and research a noted manufacturer has procured the original methods used in their preparation and again under the name of Warner's Log-Cabin Remedies, the public is possessed of those well-known preparations for the cure of coughs, colds, consumption in its early stages, blood disorders, catarrh, dyspepsia, debility, and other common disorders.

Notwithstanding the large amount of time, attention and expense which the manufacture of Warner's Safe Cure demands—its well-known reputation as the only remedy for the prevention and cure of kidney diseases being world wide—the manufacturer is resolved to push the merit of Warner's Log Cabin Sarsaparilla to the front because of its splendid blood purifying properties and great value as a household remedy and spring-time system renovator.

Pocahontas during her life-long friendship for the white settlers of Virginia, besides her many acts of kindness, is said to have contributed much valuable information to the log cabin home concerning the successful methods employed by the Indians in the treatment of disease and it matters little whether the alleged relationship between herself and the President be true or not for the name of Pocahontas is already immortal.

CHOICE TEXAS LANDS
Rare Chance for Settle s.
The Railroad System of Texas having developed so as to bring within easy access of good interior and seaboard markets the lands granted to the
HOUSTON & TEXAS CENT'L RY. CO.
It has been determined to offer to settlers the
Renowned Agricult'l Lands
Located along the line of the Fort Worth & Denver City R. R., beginning with Wilbarger County, comprising
200,000 ACRES
In farms of 160 acres and upward. These lands were located by the Company among the earliest, with especial care as to soil, timber and water. They are adapted to the growth of cotton, corn, oats, wheat, barley, rye, vegetables, orchards and gardens and the various domestic grasses.
Situated in the elevated and healthy region known as the Southern Panhandle of Texas, they possess a *genial climate*, favorable to man and beast, where outdoor work can be carried on the year round, and are in marked contrast with regions of early and late frosts or of destructive "blizzards."
Population is fast pouring in, and local government is already established, with schools, churches, &c.
TERMS OF SALE: One-fifth cash, balance in four equal yearly payments, with interest on deferred payments.
For further information as to these and lands in adjacent counties, apply to
J. S. NAPIER, Vernon, Texas,
(who is prepared to show to purchasers); or to

At druggists, or of POTTER DRUG AND CHEMICAL CO., BOSTON, MASS.

CATALOGUES, ETC., RECEIVED.

MAHER & GROSH, TOLEDO, O.—The R. N.-Y. takes pleasure in calling the attention of its readers to this enterprising and, as we believe, very trustworthy firm. We can speak from the experience of years when we say that their knives are the best and cheapest we have ever seen. An illustrated price-list and catalogue of their cutlery will be examined with interest by our readers. The "RURAL NEW-YORKER" knife is sold by this firm for 50 cents, and it seems to us to be cheap at one dollar. Pocket knives of every conceivable kind (all illustrated), pruning shears of every description, scissors and shears, razors, auger bits, axes, hatchets, hammers, vises, saws, fish-hooks, guns and revolvers are all offered in endless variety and at the lowest possible prices. These wares are sent by mail, express or freight. Send for catalogues and mention the R. N.-Y.

J. C. VAUGHAN, 88 STATE STREET, CHICAGO, ILL.—This must be classed as one of the largest, handsomest and most conservative of the catalogues issued this year. The R N.-Y. which is exerting its best efforts to throw ridicule upon the disgraceful exaggerations of many catalogues, as shown both in their illustrations and descriptions, is pleased to see that while Vaughan's catalogue is entitled to a foremost place as regards enterprise, appearance, and comprehensiveness, it nevertheless, inspires in the reader confidence that it is intended as well to guide him as it is to captivate his patronage. We certainly hope and believe that a reform in this matter is near at hand and that the superlative, wild claims made by a few bombastic, brass-faced seedsmen will force them either to quit the business or moderate their absurd presentations. This catalogue offers seeds of all kinds as well as roses, the new cannas, chrysanthemums, verbenas, dahlias, hollyhocks, small fruits, etc. The list of potatoes is excellent. In fact, it is an excellent catalogue altogether.

C. E. ALLEN, BRATTLEBORO, VT.—An illustrated catalogue (100 pages) of farm, garden and flower seeds, fruits, roses, etc. Twenty pages of specialties. This will be mailed to all R. N. Y. readers who apply to Mr. Allen.

MOREHOUSE & ANNIS, 46 FRANKLIN ST., ROCHESTER, N. Y.—A catalogue in the form of the R. N. Y., profusely illustrated of what the firm deems the best and latest varieties of vegetables, etc. The Monroe Co. Prize potato is offered.

E. & J. C. WILLIAMS, MONTCLAIR, N. J.—A catalogue of large and small fruits, hardy plants, etc. Only the well-tried standard sorts are offered.

BUSH & SON & MEISSNER, BUSHBERG, JEFFERSON CO., MO.—A valuable list of grapevines.

THE UNITED STATES NURSERIES, SHORT HILLS, N. J.—A descriptive catalogue of chrysanthemums—34 pages; also a descriptive catalogue of single dahlias with cultural directions.

G. H. & J. H. HALE, SOUTH GLASTONBURY, CONN.—A catalogue of small fruits as grown by them. It is a selection of varieties which they have found to thrive best with them. Mr. Hale presents a very instructive talk (five pages) on "Money in Small Fruits."

SYRACUSE SULKY PLOW.—Catalogue from the Syracuse Chilled Plow Co., of Syracuse, N. Y. There are two lines of business employed by this company that have greatly added to the popularity of their goods. 1. They have never attempted to make cheap stock. They have endeavored to turn out nothing but the best goods. As a consequence, very few complaints are ever heard from those who use the "Syracuse" tools. 2. They make such a variety of plows that each farmer can select one particularly adapted to his peculiar soil or surroundings. Let the soil of the farm be light or heavy; let it be as mellow as meal or as stony as an old New England pasture; let it be level or hilly, a Syracuse plow can be found of such peculiar shape or construction that it will do better work on that particular farm than any other. This business policy has attracted customers and made warm friends. It will pay you to read the catalogue sent out by this house.

"REVIEW" OF THE DEPARTMENT OF AGRICULTURE'S REPORT.—By Frank E. Billings, Lincoln, Nebraska. "Not being a coward and fearing no power this side of the grave or beyond it, I propose to enter once more upon this disagreeable task." With this very modest and cheerful remark, Mr. Billings proceeds to resume his old attack upon Dr. Salmon. If this pamphlet is issued with the authority and sanction of the Nebraska Experiment Station, the evidence is complete that that institution has already outlived its usefulness. If there is any authority that can keep this man Billings quiet, it should be exercised at once.

LINSEED-OIL MEAL.—Catalogue from the Detroit Linseed-Oil Co., Detroit, Michigan. This is a very readable little pamphlet in which the value of oil-meal as a food for animals is well brought out. Oil-meal is a valuable food for stock—that point has long been settled. American farmers are beginning to recognize the fact that this substance, skillfully mixed with coarser products, will pay a good profit to any feeder. Send for this catalogue.

STANDARD SPRING-TOOTH HARROW.—Circular from Chase, Taylor & Co., Kalamazoo, Michigan. This implement is advertised as being the strongest and best spring-tooth harrow made. It combines all the latest improvements, the tooth-holding attachment being superior to all others. It is a first-class harrow. In our "Harrow Hints" published a few weeks ago, a number of parties stated that were they confined to the use of a single harrow, that one would be a spring-tooth. Send for this catalogue and see what the "Standard" is.

NEW YORK LIFE INSURANCE CO.—Forty-fourth Annual Report. It appears from the report that this company enjoys the snug little income of $25,000,000 a year. It wrote $125,000,000 worth of insurance in 1888, and paid about $11,000,000 to policy holders. These figures are enough to startle one—into an insurance policy.

KEY TO THE FAMILIES OF INSECTS.—A pamphlet by N. M. Eberhart, published by the Popular Publishing Co., Chicago, Ill. This is one of the most comprehensive little scientific books we have ever examined. It affords a rare opportunity to those who wish to interest boys and girls in the study of entomology. The names of the more common insects can be traced through this Key and such work will surely lead to a desire for further investigation.

BENNETT'S STUMP-PULLER.—Circular from H. L Bennett, Westerville, Ohio. It is stated in the circular that with this machine, a big man can raise 20 tons! Mr. Bennett appears to be ready to pay $100 if he cannot balance a ton with five pounds or less.

KANSAS AGRICULTURE.—Sixth Biennial Report of the Kansas Board of Agriculture, from the Secretary of the Board at Topeka, Kansas. The following topics were discussed: The Sorghum-sugar Industry; Salt, its Discovery and Manufacture; Moisture Economy and The Water Supply of Central Kansas. Like most of the Kansas reports, this volume is well worthy of study and preservation.

LAWN AND FIELD STEEL PICKET FENCE.—Catalogue from the Hartman Manufacturing Co., Beaver Falls, Pa. This is said to be "the cheapest and best fence in the market." It is not a netting, it is a fence. For full particulars regarding this novelty read the catalogue.

HAVE YOU A SISTER?—This question is asked in the catalogue of O. S. Chaffee & Son, Mansfield Center, Conn. The man who is fortunate enough to be able to answer in the affirmative, will, it is assumed, desire to make the lady a present. What could be better for this purpose than a black silk or satin dress. Send for samples.

IMPROVED FARM BOILER.—Notice from J. K. Purinton & Co., Des Moines, Iowa. This firm has recently removed from Dallas Center, Iowa. The R. N.-Y. will soon give a special on the value of cooking and steaming food for stock. This will prove a most interesting topic for discussion.

PRACTICAL GARDEN POINTS.—This is a collection of excellent essays which have appeared from time to time in Vick's Magazine. They are all written by experienced people. Some of the topics treated are the following: Root Crops, Keeping Celery, Cabbage, Raising Onions, Field Culture of Onions, Peas, Asparagus, Growing Mushrooms, Grape-vines, Small Fruits, The Rose, Calceolaria, Chrysanthemum, Cineraria, Gloxinia, etc.

A. W. LIVINGSTON'S SONS, 143 North High St., Columbus, Ohio.—An illustrated catalogue of seeds of all sorts. This firm originated Livingston's Beauty, Acme, Paragon, Perfection, Favorite, Golden Queen and Potato-leaf tomatoes. The last is smoother than the Mikado or Turner's Hybrid. It was tried at the Rural Grounds and reported upon before it was announced for sale. Several new potatoes are catalogued.

WM. H. SMITH, 1,018 MARKET ST., PHILADELPHIA, PA.—An illustrated catalogue (100 pages) of all kinds of seeds, garden implements, etc. Sent to all R. N.-Y. readers who apply.

PUMP AND HAYING TOOLS.—Catalogue from T. E. Meyers & Bro., Ashland, Ohio. This pamphlet contains a very interesting and carefully written description of the Meyers pump, which is a tool containing several distinctly typical features. About every conceivable appliance that can add to the efficiency of a pump is here illustrated. In haying tools also there is an astounding array of useful tools In short, this is a pamphlet that the business farmer will want to add to his library.

QUINNIPIAC FERTILIZER.—Catalogue from the Quinnipiac Company, New London, Conn. The main feature of this pamphlet is a statement of the methods by means of which a farmer can make $1,500 in gold from a single acre.

AMES PLOW CO.—The catalogue of this excellent company is sent from Boston, Mass., and is well worth an examination. An excellent index is a feature of this volume. One can readily find any desired description or illustration. When we state that over 225 articles in use upon the farm are illustrated and described in this pamphlet, an idea is obtained of the scope of the business done by the Ames Plow Co. It is a good house to deal with.

DR. WM. ROBERTS, Professor of Medicine in the Owen's College, Manchester, Eng., in writing of Bright's disease, says: "The blood becomes speedily deteriorated by the unnatural drain through the kidneys. It becomes more watery and poorer in albumen, while urea, uric acid and the extractives are unduly accumulated in it." Warner's Safe Cure will restore the kidneys to a healthy condition and purify the blood.

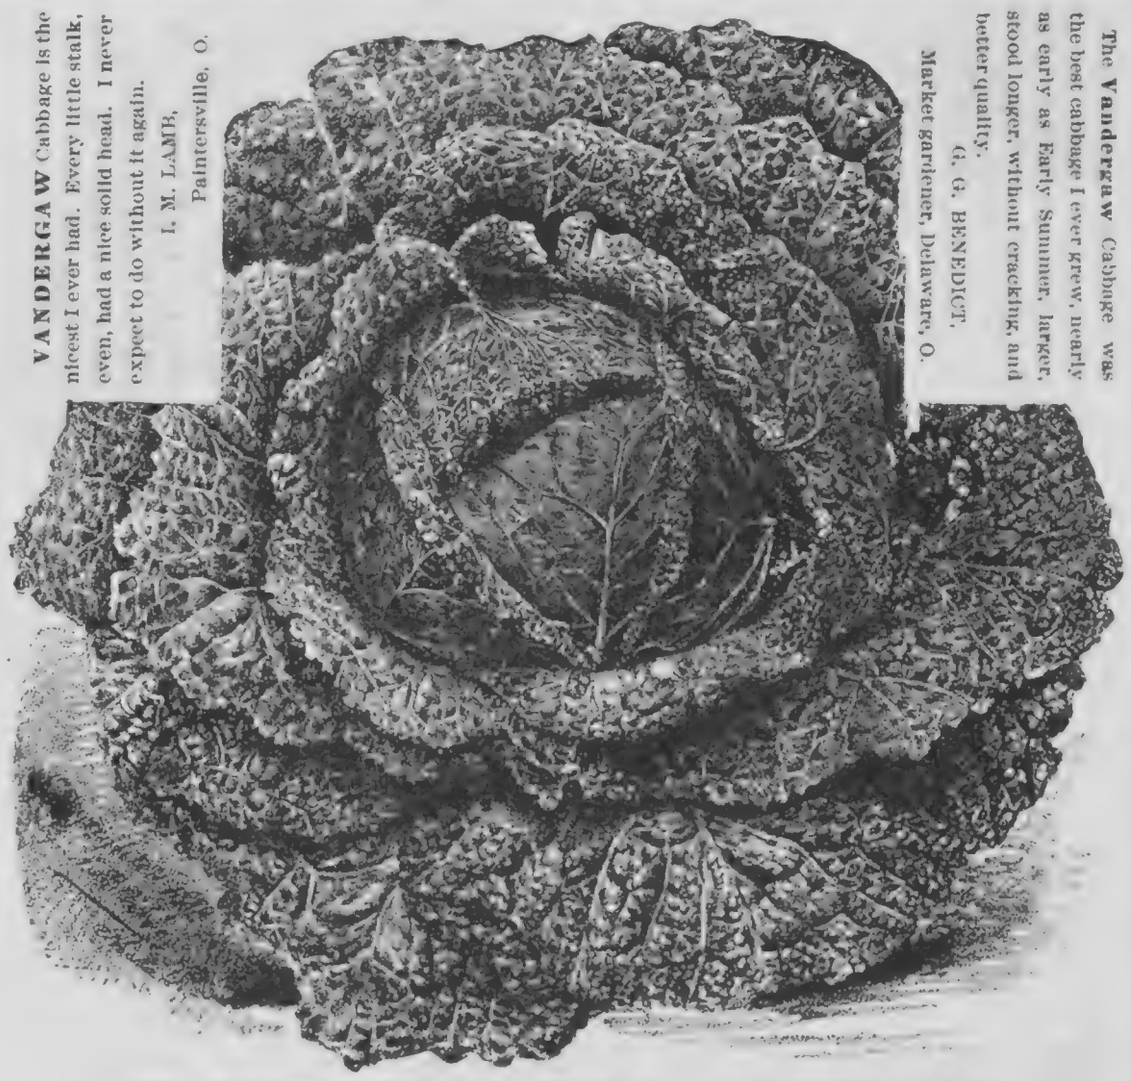
VANDERGAW Cabbage is the nicest I ever had. Every little stalk, even, had a nice solid head. I never expect to do without it again.
I. M. LAMB,
Paintersville, O.

The **Vandergaw** Cabbage was the best cabbage I ever grew, nearly as early as Early Summer, larger, stood longer, without cracking, and better quality.
G. G. BENEDICT,
Market gardener, Delaware, O.



MARVIN'S SAVOY CABBAGE.

HALLOCK'S FAMOUS LONG ISLAND SEEDS.

Our finest strains of seed can only be procured from us. We have many specialists who raise seed for us exclusively, selecting the cream from many acres of stock. The following is an extract from the report of the New York Experimental Station on

Marvin's Savoy Cabbage.

"Among several excellent new varieties of Cabbage, Marvin's Savoy (Hallock) yielded twelve heads from twelve plants averaging nine inches in diameter and weighing six pounds each. This is an extraordinary production for the Savoys, which are decidedly superior to common cabbages in table qualities."

We sell this Cabbage 10c Pkt., 1-2 oz. 35c, 1 oz. 60c, lb. $8.00.

Finest strains of Long Island Vegetable seeds. Beautiful flowers, Bulbs and Plants. Catalogue free.

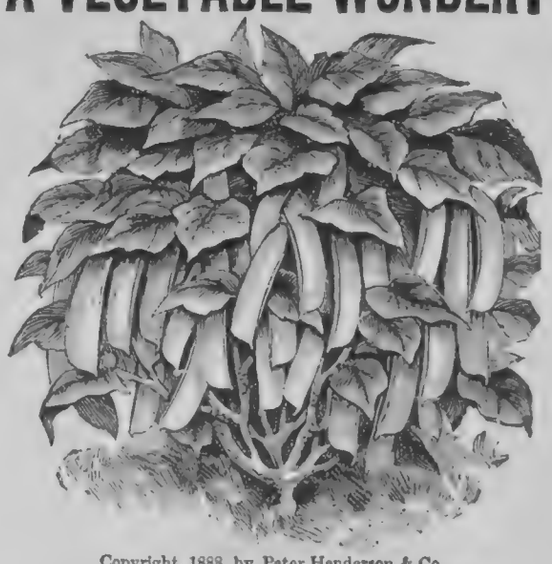
A VEGETABLE WONDER!



Copyright, 1888, by Peter Henderson & Co.

HENDERSON'S NEW BUSH LIMA BEAN

Can and Should be Grown in every Garden on the Continent.

Of all the *Novelties* in *Garden Products* ever sent out, there is nothing so entirely distinct and valuable as this *New Vegetable.* The old Lima Bean can only be grown on poles, while the *NEW BUSH LIMA* grows and is cultivated exactly like the common bush or snap bean (growing only 18 inches high), and from the time of its bearing in July, produces in abundance delicious Lima Beans throughout the entire season until frost. It has, besides, an additional value, in that it is *two weeks earlier* than any other Lima Bean, being fit for the table in from 40 to 50 days from time of planting.

Price (by mail) 25 cents per packet, 5 packets for $1.00, 12 packets for $2.00. 12 packets sufficient for an ordinary-sized family for the season). Directions for growing on each packet. Remittances can be sent either by Post Office Order, Postal Note or Stamps.

Every purchaser of *Henderson's Bush Lima Bean* will be sent, *without charge,* our MANUAL OF EVERYTHING FOR THE GARDEN, a book of 140 pages, size, 9 x 11, containing 3 colored plates (the price of which is 25 cents), *on the distinct understanding,* however, that those ordering will say in what paper they saw this advertisement.

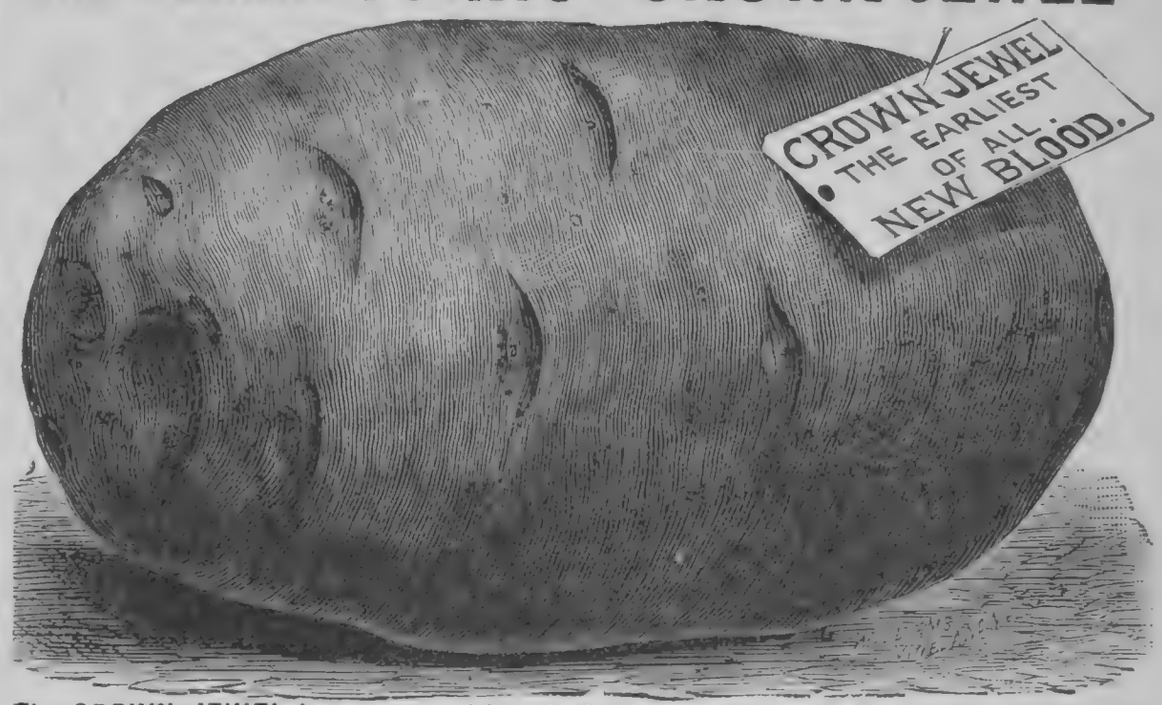
THE COMING POTATO "CROWN JEWEL"



The CROWN JEWEL is pronounced by all who grew it the past season the CREATEST POTATO INTRODUCED SINCE THE EARLY ROSE, yielding in all cases where grown on a large scale from 500 to 625 bushels to the acre, and on the grounds of the "RURAL NEW YORKER," (see report of Potato trials published in that paper) at the rate of 726 bushels per acre--grown in competition with Early Ohio, Early Rose, Sunrise and other popular varieties, it more than doubled the yield of any of them and was ready to dig fully a week earlier. A strikingly beautiful Potato of finest table quality. The vines grow vigorously, roots extending very deeply into the ground thus resisting drought. PRICES: Per lb. 40c. 3 lbs. $1.00 by mail postage paid. Peck $1.00; bushel $3.00; barrel $7.00. Order now. Our GARDEN AND FARM MANUAL FOR 1889, accompanies all orders. Address **JOHNSON & STOKES, Seedsmen,** 217 & 219 Market St., Philadelphia, Pa.

Some of the crops grown with the MAPES MANURES. Full descriptions of method of planting, etc. have been given in Agricultural Journals and the Mapes Pamphlet during the past two years.

POTATOES. COMMON FIELD CULTURE.

3850 bushels on 10 acres, 1500 pounds per acre of the Mapes Potato Manure.

3250 bushels on 10 acres adjoining the preceding half of the field, 1500 pounds of the Mapes Potato Manure and 15 to 20 loads of farm manure per acre. Yield 60 bushels per acre less than with the Mapes Potato Manure alone.

610 bushels on two acres, 1400 pounds of the Mapes Potato Manure per acre.

1060 bushels on 3½ acres, 1600 pounds of the Mapes Potato Manure per acre.

1135 bushels on 3¾ acres, 800 pounds of the Mapes Potato Manure per acre.

1500 bushels on 3 3-16 acres, 800 pounds of the Mapes Potato Manure per acre.

495 bushels on one measured acre, 800 pounds of the Mapes Potato Manure per acre.

The above crops were all grown by prominent farmers who have used the MAPES POTATO MANURE for many years (in some cases 12 years), and who have found their succeeding crops of Wheat and Grass, following the potatoes, VERY LARGELY INCREASED by the Potato Manure LEFT OVER from the potato crop.

YIELDS ON PLOTS LESS THAN ONE ACRE.

1888 On one-eighth of an acre 128¼ bushels equal to 1026 bushels per acre, 1600 pounds of the Mapes Potato Manure per acre.

Some of the yields with the MAPES POTATO MANURE by the RURAL NEW-YORKER in the plot tests by Mr. E. S. Carman were at the following rate:

1048 bushels per acre, variety "State of Maine,"
1140 " " " " "Corliss's Matchless,"
1076 " " " " Rural New-Yorker No. 2.

The Mapes Potato Manure in its action approaches certainty or as near it as any manure can be expected to do. E. S. CARMAN, Rural New-Yorker.

Send to the Mapes Company for descriptive pamphlet and for full account of UNPRECEDENTED PRIZES offered for largest one-acre crops of potatoes, corn, oats, wheat. Season 1889. No charge.

THE MAPES FORMULA & PERUVIAN GUANO CO.,

158 Front Street, New York.

PURE PERUVIAN GUANO FOR SALE. ALL GRADES. IN ANY QUANTITY.

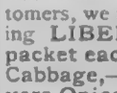
A GRAND NEW ONION from GREECE. Unlike all others in form, *extremely handsome*, with thin, brown-yellow skin. *Very early*, of *unusually mild, pleasant flavor*, most remarkable from the fact that it is the first and *only one* of the large, mild Adriatic Onions that is *really a good keeper*. Solid and fine grained, *it remains as mild* and *sweet flavored in mid-winter as when freshly gathered*. A great acquisition, furnishing fresh, mild Onions *all the year round*.
Per packet 15 cents; or 2 packets for 25 cents.

BURPEE'S WHITE GEM WATERMELON A unique new variety from China; *really a gem*, both in *distinct beauty* and *delicious quality*. Ripens *early, wonderfully prolific*, and is *the sweetest of all watermelons*. The skin is a *cream-white color*, while the flesh is rich, bright pink, crisp and juicy. See beautiful *colored plate* in *Burpee's Farm Annual for 1889*.
Per packet, 15 cents; or 2 packets for 25 cents.

NEW MID-SUMMER LETTUCE. Of early, quick growth, this is *the best of all Lettuces* for use throughout the Summer. Firm heads, most attractively colored outside, with large, rich *golden yellow heart* within, *as tender and brittle as can be*. Peculiarly fine in flavor. Per packet, 15 cents; per oz., 40 cents.

THE 3 RARE NOVELTIES FOR 1889

briefly described above, are now first introduced, and can only be had direct from us. Seed of any will be mailed up[on] receipt of price. In order to introduce BURPEE'S SEEDS to thousands of new customers, we make the following LIBERAL OFFER. **For 50 Cents** we will mail one packet each of the above Novelties, AND ALSO one packet each of [the] New Volunteer Tomato,—very bright colored, smooth and early,—New Peerless Cabbage,—ear[ly] and solid,—New Model Carrot,—the best in quality and appearance,—Globe Danvers Onion,—[the] strain,—Burpee's Golden Upright Pepper,—largest, sweetest, and most handsome, New Densi[ty] a,—New Perfection Musk Melon,—Peerless Cucumber,—Burpee's Improved Blood Beet [and] Earliest Carmine Radish,—Sugar Pumpkin and Burpee's Surehead Cabbage, —the famou[s] *head and always sure to head Cabbage.*"



The above FIFTEEN PACKETS of THE CHOICEST and NEW VEGETABLES standard retail prices are worth $1.35, but we will send the entire collection, *neatly boxed*, by mail, *postpaid*, to any address, for only **50 Cents** in *postage* [stamps], or FIVE BOXES for **$2.00.** We have the Largest Mail Seed Trade in America, built upon the high quality of BURPEE'S WARRANTED SEEDS, and this Remarkable Offer is made to [introduce] thousands more to TEST OUR SEEDS. Entire Satisfaction Guaranteed to all purchasers, the great majority of whom we hope to retain as regular customers. ORDER NOW, and if you have not already received a copy, ask for **BURPEE'S FARM ANNUAL** for 1889, *enlarged and improved*, a most complete book of 168 pages, with beautiful colored plates, and hundreds of *illustrations from nature*. It tells all about the BEST SEEDS, Bulbs, Plants, and Thoroughbred Stock. It is full of useful information to every progressive farmer and gardener. Entirely free from exaggerated descriptions, it offers THE BEST SEEDS at fair prices. *Write to-day.*

Holstein steer, NICHOLAS. Age in days, 976. Live weight, 1,660 pounds. Gain per day from birth, 1.70 pound. Dressed weight, 1,014 pounds. Per cent. dressed to live weight, 62.8. Fig. 68.

Photographic Illustrations of Steers of Different Breeds fed at the Michigan Agricultural College.

The Herdsman.

BREED AGAINST BREED!

Beef-Making Experiments

AT THE

Michigan Agricultural College.

SOME SURPRISING FACTS DEVELOPED.

THE RURAL'S ENTERPRISE ILLUSTRATED.

MOST of our readers are aware that during the past three years a novel experiment has been in progress at the Michigan Agricultural College. Various ideas are held at the different agricultural colleges as to the character of the live stock that should be kept in order to give the most useful instruction to the students. At some of the colleges, for example, the aim is to develop a good herd of the breed of cattle that seems, by general consent, best adapted to the general agriculture of the State in which the college is located. Others maintain specimens of each of the beef breeds, while still others are to be found handling only the dairy breeds. The policy of the Michigan College has been to keep in the herd choice specimens of every distinct breed of cattle so that students may study the characters of each. For a number of years, Prof. Johnson, of the Michigan College, has desired to conduct beef-making tests similar to the dairy tests which are quite common. His plan was to select young calves that should be average specimens of the different breeds, and as nearly alike in age and general condition as possible. These calves were to be fed, side by side, to the age of three years or thereabouts, using the same kinds of food for each, though of course, different quantities would be fed to the different animals. An exact record of the amount and value of the food consumed by each animal should be kept, and accurate weighings of the animals should be made from time to time so that a correct estimate of the gain for each period of feeding might be made.

It will be readily seen that such a test would provide a basis for some very valuable reckoning in live-stock economy. The advocates of the various beef breeds are loud in maintaining that their pet animals will make the cheapest pound of beef. The advocates of some of the dairy breeds are equally loud in maintaining that their bull calves can be profitably fed for beef. Most of the tests that provide figures for these claims have been made under exceptionally favorable circumstances where the question of profit did not enter. Consequently a test, conducted on a basis somewhat like that to be followed by a farmer, would be doubly valuable.

Three years ago Professor Johnson was able to begin the desired test. After considerable delay he succeeded in securing bull calves of Short-horn, Hereford, Devon, Jersey, Galloway and Holstein breeds, that were considered average specimens. With these calves the trial was conducted. They were kept in a thriving condition, and were never forced as show cattle usually are. The steers were exhibited at a number of fairs and were slaughtered at the Chicago Fat Stock show last November. Great pains were taken to obtain trustworthy opinions as to the relative merits of the animals. A committee composed of some of the most experienced feeders in America, and another committee composed of Chicago butchers carefully examined the steers and the quality of meat was judged by the cook and the guests at the Sherman House, Chicago. In fact, it may be justly said that this is one of the most important tests of cattle that has ever been made. It is not fully complete; it does not fully decide the queston, and determine which is the profitable beef-making breed; but it does open the discussion in a solid business-like way, devoid of guess-work and estimated figures. We hope the test will be repeated and elaborated. We are sorry that the Ayrshire cattle were not represented, and that a lot of scrubs or natives were not fed with these thoroughbreds that the value of good blood might be more forcibly illustrated.

On another page the RURAL gives accurate pictures of the six steers selected for the test. The cuts are made directly from the photographs and are absolutely true to life. The RURAL pays more for these cuts than many of its contemporaries pay for all the cuts they use in a year. We also give exact pictures of the choice cuts of meat from the different animals.

It is not proposed to give, in these pages, anything more than a general outline of the experiment. Those who wish to obtain Prof. Johnson's full statement should send to the Michigan College for bulletins 24, 30 and 44.

THE ANIMALS.

SHORT-HORN, HOMER.—A picture of this steer with figures regarding his weight, etc., is given at Fig. 69. At Fig. 75 are shown two sections of his carcass. This steer was dropped November 25, 1885. He ran with his dam—a good milker— until July, 1886, though in the meantime he had been taught to eat meal and hay. He was castrated December 28, 1885. He came from excellent stock. It may be said here that the grain fed to all the steers was composed of two rations: one made up of wheat bran, oats whole or ground and old-process oil-meal; the other of a mixture of two-thirds corn and one-third oats ground together, in the place of the oats. They were also fed clover and Timothy hay and corn silage.

HEREFORD, HENDRICKS, (see Figures 65 and 71), was dropped October 27, 1885. He ran with his dam, taking all her milk, and at eight weeks began to eat meal—a mixture of oats and barley. He was castrated when four months old.

DEVON, LATITUDE (see Figs. 64 and 70) was dropped March 23, 1886 and castrated July 6, same year. He was taken from his dam three days after birth and fed new milk for 10 days. After he was two weeks old he was fed four quarts of creamery skim-milk twice per day and taught to eat meal and hay.

JERSEY, ROSCOE (see Figs. 67 and 73) was dropped August 27, 1885 and castrated October 13. He was fed milk for 122 days, consuming 1,259 pounds up to February 23, 1886. He had in addition to the milk, 165½ pounds of hay and 165½ pounds of grain. He weighed 306 pounds.

HOLSTEIN, NICHOLAS (see Figs. 68 and 74) was dropped February 26, 1886 and was castrated April 22. He was reared on the pail and fully weaned from milk July 10, when he was fed oat-meal and "calf-meal."

GALLOWAY, KING JUMBO (see Figs. 66 and 72) was dropped February 17, 1886, and was castrated March 30. He was taken from the cow but drank about all the milk she gave During the third month he ate, in addition to the milk, five pounds of oil-meal and five pounds of wheat-bran. During the fourth month he ran at pasture and had skimmed milk and ate eight pounds of oil-meal and 50 pounds of bran.

REPORTS OF JUDGES.

FROM A FEEDER'S STANDPOINT.—The Short-horn steer, Homer, we rank first in the lot so far as profit from the feeder's standpoint is concerned. He weighed 1,870 pounds at 1,071 days old, a gain of 1.74 pound per day. Homer also ranks first in value for the market as well as the block. On most markets, he would outsell any of the others.

The Hereford steer, Hendricks, as a butchers' bullock is equal to the Short-horn, He has not made growth enough for age, weighing 1,450 pounds at 1,100 days, a daily gain of 1.32 pound, to make a profitable beast for the breeder. On account of the lack of weight he would not bring quite so much as the Short-horn in the market.

The Devon steer, Latitude, we should place third as a butcher's bullock and a seller in the market. While he is a well fleshed and even steer, he has not made growth enough to be profitable to the feeder, weighing 1,270 pounds at 953 days, a gain per day of 1.33 pound.

The Galloway steer, King Jumbo, on account of his rapid growth, weighing 1,620 pounds at 987 days, a daily gain of 1.64 pound, should be ranked second as a profitable beast for the breeder. While he lacks somewhat the finish and quality of the Devon, on account of his greater weight he would rank with him in market value. As a butcher's bullock we should rank him fourth, his finish not being quite equal to the Devon.

The Holstein steer, Nicholas, has also made rapid growth, weighing 1,660 pounds, at 976 days old, a growth of 1.70 pound per day, which would class him with Galloway, from the standpoint of giving good returns to the feeder. He, however, lacks the quality which makes the best type of a butcher's bullock. He is too coarse, in the opinion of the committee, to make a profitable bullock, for the reason that, when finished and placed on the present markets, he would have to sell at a reduced price, from $1.00 to $1.50 per hundred less than the Short-horn or Hereford.

The Jersey steer, Roscoe, while an excellent specimen of the breed, should rank lowest as a feeder, weighing only 1,420 pounds at 1,161 days old, a daily gain of 1.28 pound. In the present markets we think he would sell for the same price as the Holstein, while, as a butcher's beast, on account of his finer bone and ripeness, he would be superior.

FROM A BUTCHER'S STANDPOINT.—"The committee selected to report on the respective merits of the carcasses of six steers, each of a different breed, exhibited by the Michigan Agricultural College, respectfully report: That as to quality and percentage of edible meat combined, making a profitable carcass for the butcher and consumer as well, we place first, the Hereford; second, the Devon; third, the Galloway; fourth, the Jersey; fifth, the Short-horn; sixth, the Holstein."

FROM A COOK'S STAND-POINT.—Mr. Pearce of the Sherman house, says: "Taken as a whole, the beef was very good. My head cook, who is an unusually intelligent and experienced handler of meats, says (and I have bought beef at every one of the Fat Stock Shows held here) that it was the best flavored and most profitable, from having the least waste meat, of any that I have ever bought at these shows.

"I found the Jersey gave me a larger proportion of edible meat than any of the other carcasses, in fact there was no waste to it. No person tasted the meat without speaking of it. I was astonished at the amount of favorable comment it excited in regard to its tenderness and fine flavor. The poorest parts were better than ordinary choice cuts. The fats were good and profitable for use in cooking. Our pastry cook called it equal to butter.

"Next in order came the Galloway in quality and flavor and amount of edible meat; then the Hereford, the Holstein and the Devon in the order named; the Devon, in amount and flavor of the edible meat and quality of the fats, being equal to either of the other bullocks, except the Jersey, but lacking that tenderness found in the others. The Short-horn was fine in flavor and as tender as any one could desire, but would be very unprofitable to the consumer. There was a very large waste in fats; much of what we call the corning pieces were so spongy and fat that we could not corn them or otherwise use them except to render them for fat which we could not use in cooking, and that is a product of little value to the consumer."

FIGURES.

From the many tables of figures given by Prof. Johnson we have compiled the following which give the most interesting feature of the experiment.

	Pounds of hay Consumed.	Pounds of Grain.	WEIGHT. First Year.	Second Year.	COST PER POUND. To Nov. 1st 1888.	Average for the whole period.	Gain per day.	To Nov. 1st 1888.	Second Year.	First Year.
Devon	5389	5318	521	1009	.08	.058	1.33	1270	1.09	.025
Hereford	6588	5847	705	1105	.117	.053	1.30	1424	1.05	.01
Galloway	5703	6711	738	1222	.076	.049	1 64	1620	1 22	.02
Jersey	7118	6793	571	1007	.11	.062	1.26	1383	1.07	.02
Holstein	6687	7300	731	1316	.093	.053	1.70	1660	1.16	.022
Short-horn	7798	8142	801	1367	.105	.055	1.74	1870	1.67	.015

NOTES.

As a result of this trial, Prof. Johnson concludes that there is but little difference in the cost per pound of raising steers of the different breeds under the same conditions. The superiority of the beef breeds rather lies in their early maturing qualities, which enable the feeder to turn them off, well ripened, at two instead of three years. Calves brought up on the pail, when properly fed, will make as much growth and be as valuable for feeding as if they were allowed to suckle their dams.

The lesson is very emphatically taught that average native steers, weighing from 1,100 to 1,300 pounds at three years, or often much less, cannot be raised and fed with profit. Well bred steers weighing from 500 to 800 pounds more at the same age may be. The value of good blood for beef production cannot, then, be over-estimated. It, only can, with good care and skillful feeding, in these times and with the present markets, bridge the margin between loss and profit for the grower and feeder.

The quality of beef produced by a combined grain ration, in which wheat bran, oats and some oil-meal form the principal part, is preferable to that produced by a corn ration exclusively. He believes these animals would have had a much less percentage of meat valuable to butcher and consumer if corn had entered largely into their grain ration.

The cost per pound of production is greatly increased with each succeeding year. Certainly under most favorable conditions steers of early-maturing breeds should reach the limit of profit at from 24 to 30 months at latest. This may be modified in ordinary feeding by the fact that the yearling steer will need more expensive food than older ones. The latter will consume more rough fodder profitably than the former.

The largest per cent. of dressed to live weight does not always indicate the best quality of meat, or the most profitable carcass for the dealer or consumer. The commonly received opinion that the steer that shrinks least in killing, is the best for the butcher, must be more or less modified by other conditions.

Horticultural.

WARRANTED SEEDS.

EVERY season brings hundreds of complaints from parties who claim to have been unfairly used by seedsmen and nurserymen. Seeds and plants have been bought, often at high prices, that have been carefully planted and cared for only to produce the most disappointing results, because they were untrue to name and either carelessly or intentionally mixed. With a view to arriving at some fair method of lessening these mistakes and giving some basis for satisfactory settlement, we sent the following question to a number of seedsmen, nurserymen and farmers. Many of the seedsmen, wished to be excused from answering; the answers given, however, may serve to start the discussion at least.

What guarantee should the reputable seedsman give that his seeds or plants are sound and true to name?

If a seedsman or nurseryman by accident sends high priced seeds or plants untrue to name, thus entailing loss and disappointment upon purchasers, should the seller be held responsible, and what would be a fair basis for settlement?

FROM ROBERT BUIST, JR.

I think that the purchasers of seeds or plants should be protected to a certain degree, that is, if the seeds or plants do not give satisfaction, the purchaser should either have his money returned or the seeds or plants replaced. This is my manner of treating customers. A reputable seed house rarely sends out anything which is untrue to name and character.

FROM J. M. THORBURN & CO.

We fail to see in what respect our business as seed merchants differs from that of any other reputable merchant who buys and sells any other kind of merchandise. The risk the farmer or gardener assumes is incidental to his business as such, and his best guarantee is the reputation of the seedsman from whom he purchases.

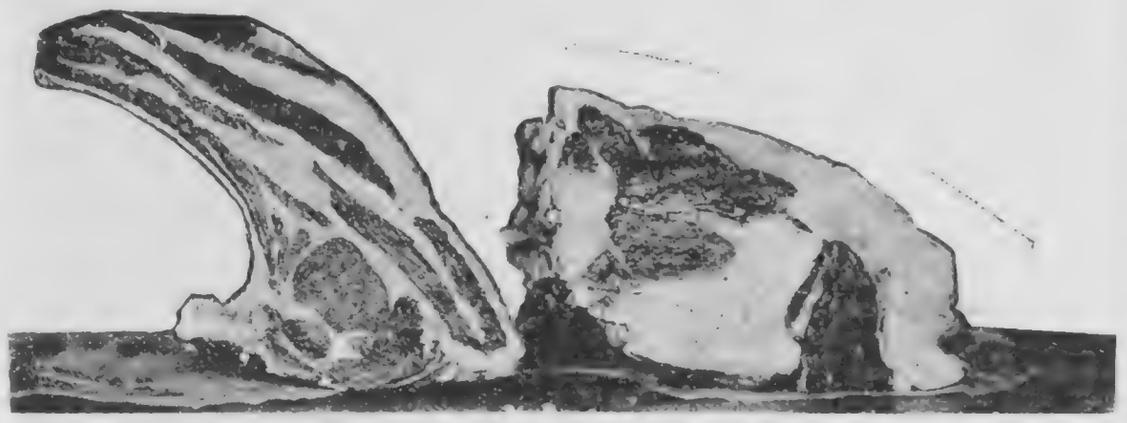
FROM J. A. FOOTE.

The question as to a warranty of seeds and plants is an exceedingly difficult one, especially as to seeds. Plants are mostly grown, or should be, by the seller, and he should know whether they are true to name and in good condition when they leave his hands. But as to a warranty that they will grow under all the conditions that may befall them from the elements and the ignorance and neglect of those who plant them, that would seem to be too much to ask. Much more is this true of seeds. No seedsman, not even the most exten-

sive one, grows all the seeds he sells, and thus no dealer can always know the genuineness of all his seeds. Then, there are hundreds of seedsmen who buy all the seeds they sell. The law perhaps takes no cognizance of ignorance in anything, and holds the seller responsible. As I take it, this inquiry is not as to the law, but as to the moral right that should govern the law, and when I come to that point I do not feel able to express an opinion on it. It seems that there should be some responsibility on the seller, but the whole burden seems too great. Of course, the seedsman should be responsible for putting out seeds known to be defective or untrue; but as to mistakes, mixtures or supposed lack of vitality, there should I think be at least a division of loss.

CHOICE CUTS FROM DEVON BEEF. Fig. 70.

In regard to the growth of seeds probably nine times out of ten the failures are due to other reasons than a want of vitality. Certain seeds are very susceptible to conditions—for instance, sweet corn and wrinkled peas. These planted in heavy soil when cold and wet are sure to rot before sprouting. But even sorts that are hardy are uncertain. A single illustration will show this. A customer reported to me that he sowed part of a package of turnip seed in a bed, and they grew well. He sowed the remainder of the package in another bed on the same day, and they failed to grow. Supposing that there was both good and bad seed in the package, it was impossible that he could have separated them; but he never knew why one failed and one grew. Had all been sown in the second bed the failure would have been charged to the seed. These represent some of the difficulties in warranting seeds. The seedsman may, however, as policy, warrant seeds to a limited extent, taking the risk of ignorance, neglect and bad conditions to the extent of replacing the seeds or even refunding the money. Counting that the outlay for doing this one time in 20 or 50 or 1,000 cases, might be made up by increased sales. This question of expediency every seedsman can settle for himself. The question of right is so difficult that no iron-clad rule should be made. I think that in most cases the presumption should be on the side of the seedsman—that is, that the fault of failure is not his. It is right on the other hand that he should use great care, and I think that honesty is so recognized to be the best policy in this trade that care is generally exerted, and if so, then few will suffer except by their own fault or circumstances that cannot be overcome.



CHOICE CUTS FROM HEREFORD BEEF. Fig. 71.

FROM W. ATLEE BURPEE & CO.

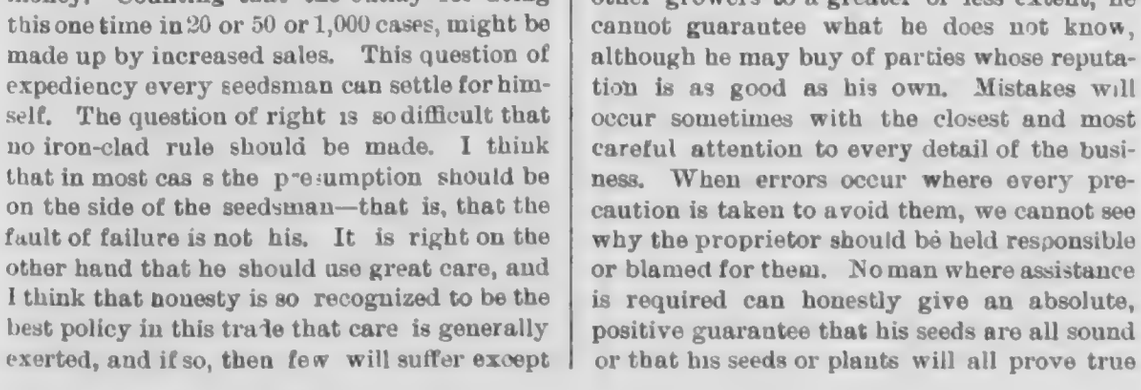
The best answer we can give to these questions is to state our own method, which is that we warrant all seeds to be first-class, pure and true to name, in so far that should any prove otherwise, we will refill the order, or return the price paid, at the option of the purchaser. Of course, mistakes will occasionally occur; but the conscientious seedsman will surround the handling of seeds with all possible safeguards, so that the chance of errors is reduced to a minimum, and when an error does occur, he cannot of course assume the responsibility for the estimated possible results of a good crop in a good season—that is, he cannot be held responsible for possible consequential damages.

FROM W. H. MAULE.

I have always guaranteed my seeds to be just as represented, insomuch that should they prove otherwise, I will refill the order free of charge. It must be understood by all my customers, however, that I never guarantee a crop of anything further than that should the seeds prove unsatisfactory, I will refill the order, and I do not consider more should be asked.

FROM STEPHEN HOYT'S SONS.

We do not think a seedsman or a nurseryman can give a positive guarantee that his seeds are all sound or that his trees will all prove true to name. Of course, any reputable or responsible seedsman or nurseryman will do all in his power to have everything correct and honest; but when the work has to be largely entrusted to others, as it is at the present day, or when one's sales are larger than his own resources for growing seeds or plants, and he is therefore obliged to buy from other growers to a greater or less extent, he cannot guarantee what he does not know, although he may buy of parties whose reputation is as good as his own. Mistakes will occur sometimes with the closest and most careful attention to every detail of the business. When errors occur where every precaution is taken to avoid them, we cannot see why the proprietor should be held responsible or blamed for them. No man where assistance is required can honestly give an absolute, positive guarantee that his seeds are all sound or that his seeds or plants will all prove true to name. No honest person will make such a guarantee. A responsible seedsman or nurseryman should be required only to make such a guarantee as he can live up to, which is that every care and precaution shall be taken to have all seeds sound and all plants true to name.



CHOICE CUTS FROM HEREFORD BEEF. Fig. 71.

If by accident high-priced seeds or plants are sent out which prove untrue to name, as soon as the fact is known others which are true should be given free to replace them, but no damages should be required. "Do unto others as you would that others should do unto you," and none will be wronged and all will be satisfied.

CHOICE CUTS FROM GALLOWAY BEEF. Fig. 72.

CHOICE CUTS FROM BEEF OF JERSEY. Fig 73.

believe parties so doing should pay heavy damages. Here is a field of action for our Nurserymen's Association.

FROM P. M. AUGUR.

The characters of most of our seedsmen and nurserymen are so well known that we should be slow to believe an intentional fraud would be perpetrated by them. In introducing novelties, of course, confidence has to be felt in the care and good faith of the disseminator, and here the "golden rule" should always have sway.

In case of satisfactory evidence of a mistake, few if any firms exist that will not do

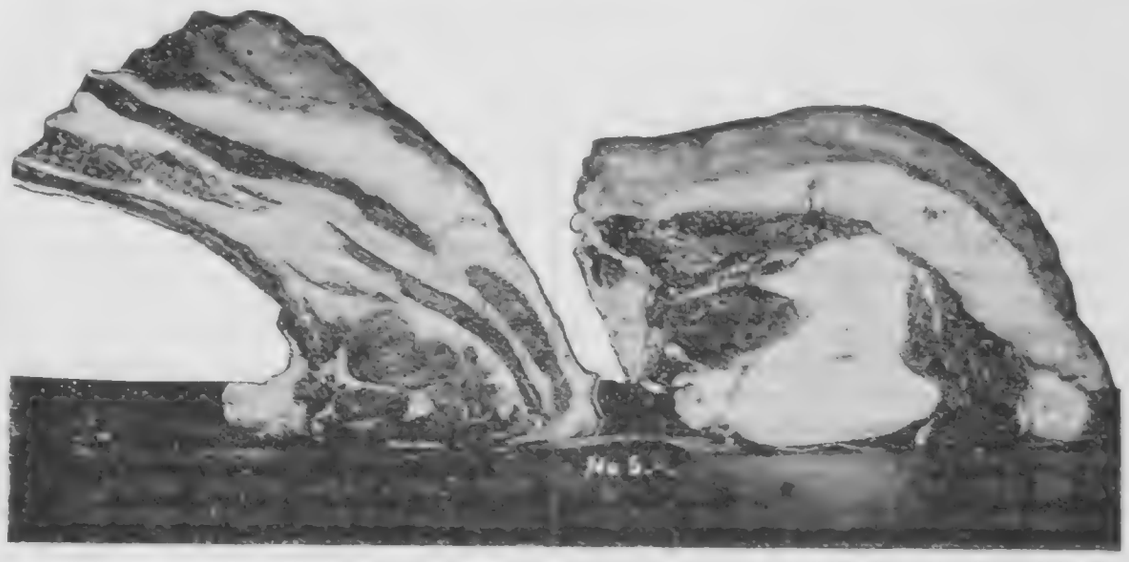
CHOICE CUTS FROM HOLSTEIN BEEF. Fig 74.

FROM PUTNEY & WOODWARD.

We answer the first question by quoting the following from our price list.

"We warrant our stock true to label to the extent that if found otherwise, we will replace the stock or refund the money paid."

We would guarantee to a greater extent were it not that a number of parties would be apt to take advantage of it. To the second question we would say that the seller should be responsible for any accident or carelessness of the grower, digger, packer or book-keeper. It is a costly matter to the seller to replace the objectionable seed; so that the buyer, although he may have lost heavily, can hardly expect more. When a buyer of seeds expends a large amount of money in preparing the soil, and sows seeds that should germinate but which fail, or prove spurious, he certainly feels like demanding damages in full, and we cannot blame him; neither can we reimburse him.



CHOICE CUTS FROM SHORT-HORN BEEF. Fig. 75.

Trees and plants untrue to label need not be sent out if the nurseryman sells only what he himself raises. We believe it is a mistake for the nurseryman to catalogue what he has not of his own growing. True, he will lose much trade that naturally gravitates to the grower who is supposed to have the largest stock and greatest variety. Sending out old varieties under new names we heartily condemn and believe parties so doing should pay heavy damages. Here is a field of action for our Nurserymen's Association.

FROM JONATHAN TALCOTT.

A seedsman's good reputation for honesty, and his endeavors to send out only such seeds and plants as are true to name should be his guarantee, especially when seedsmen have had a reputation for such dealings for a series of years. If a seedsman or nurseryman by *accident* sends high-priced seeds, or plants untrue to name, thus entailing loss and disappoint-

the fair thing in regard to the error. The public would not be benefited by a severe or cast-iron law in this matter.

We once sold a lot of beautiful ornamental trees for a new street in a neighboring city. We were pressed to warrant those trees, and knowing the probabilities we cheerfuly did so. The next spring we were mortified on finding that nearly half of them had failed. We suspected that something was wrong, but supposed that the mishap was due simply to carelessness in setting them out. We replaced them, however. Some time afterward we learned that the man who planted them out, put each tree in a saw-horse and systematically sawed off the roots so that the trees would go into very small holes. Thus we were victimized. If the "golden rule" were applied in all cases, there would be little trouble.

Be honorable and deal with honorable men, and there will be little cause of complaint.

ment upon purchasers, the price of such seeds, or plants should be refunded, or seeds and plants true to name should be furnished, as soon as the accident was discovered. That, in my opinion, is all that should be demanded or expected under such circumstances. It would be impossible for any man to determine the loss or damage resulting from such an accidental sending out of such seeds or plants. The purchaser no doubt would place his loss or damage at very much more than the seller, or than even disinterested persons. There might be a case where no loss or damage would occur; other causes might combine to destroy a crop of the best and purest seed; hence no person or persons would be competent to assess such loss or damage on its true basis.

FROM T. H. HOSKINS, M D.

1. The fact that the seedsmen of highest character and repute in America all refuse to give any broad warranty of their seeds is, I think, sufficient proof that to do so is not practicable; for certainly any well established and reputable house which would break through the universal custom could greatly increase its trade. But to do so would so surely wreck the best business in the country that an association, combination, or "trust" arrangement, is needed to insure good faith all around, in this matter. The tremendous risk of insuring a pound, or even an ounce of some kinds of seed, is so utterly disproportioned to any possible profit, that no seed seller can undertake it. A careless or angry clerk might ruin the richest concern in a single season. In its practical results, this refusal to warrant leads rather to the selling of better and purer seeds; for good houses, feeling that they must refuse to warrant, also feel that in every other way they must endeavor to satisfy their customers.

But any seedsman or nurseryman, who by accident sends high-priced seeds, or plants untrue to name, having refused to warrant them, must naturally feel very sharply the danger to his business which a "high and mighty" indifference to the disappointment and loss entailed upon the buyer will cause. Every reasonable satisfaction ought to be made; but in the case of seeds, especially, the loss to the buyer in consequence of the error is often so very large, compared with the price of the seeds, that the necessities of the case must leave by far the greater part of that loss with him, and he must bear it as he bears other inevitable misfortunes. As a matter of practical experience, I think the risk of a judicious buyer dealing with a house of established repute, is not great. When loss occurs, while the seller must have the protection which he gets by refusing to warrant, yet every effort ought, I repeat, to be used by him to make that loss as light as possible, consistent with the nature of the business.

FROM T. B. TERRY.

The seedsman should guarantee, first, that all seeds will grow. If they fail he should agree to refill the order without further charge, or return the money paid, at the buyer's option. All seeds should be tested and the seller should know what he is selling well enough to be willing to make this guarantee. Now, on the other hand, the buyer should purchase all seeds in time to test them before planting, unless he is willing to take the risk. If he finds them poor he has time to get others. The loss, beyond disappointment, is small. He must put his disappointment against that of the seller and call it square.

In regard to plants sent out, if they are manifestly unsound when received (like a bunch of grape-vines sent me last spring, with moldy, dried-up roots,) the seller should be willing to furnish good plants promptly, or to return the money, and in either case to refund the expenses to which the buyer has been put. If thrifty-looking plants are received by the buyer, and they seem to be in good order, but afterwards fail to do well, I see no way but for the buyer to stand the loss. How can it ever be decided who was to blame? The presumption would be that the trouble, as a rule, would be at the buyer's end, as a "reputable nurseryman" would be likely to understand the management of plants or trees better than most buyers. Then again, his reputation would be at stake. Plants sent out that failed to grow would hurt him more than what he made on them would help him.

In regard to the second question: I send my man out to clear up some land. He sets fire to a brush heap that is two or three rods from the line fence. Not far off stands a neighbor's hay stack. The wind is blowing towards it. If it burn I must pay for it, according to Ohio law and justice. I am responsible for what my employés do in the course of their regular business. Now, again, suppose the wind was blowing right away from the stack when my man set the fire but, suddenly, at just the wrong moment, and without warning, it changed and thus my neighbor's hay is burned. This would be a pure accident. I have a right to clear my land with reasonable precautions and could not be made to pay for the hay. I should, of course, be very sorry, but could hardly be blamed.

Again, supposing my man in driving along the highway with a heavy load on a good wagon, carelessly runs into some one and breaks off a wheel from his vehicle. I must pay for it. He is my employé. I put him in a position to do this damage. But suppose just as he was turning out, an axle broke and he could not go farther. The other man was too near to do all the turning in time. Now I could not be held responsible. It was purely an accident.

Let us apply these rules to the seedsman or nurseryman who sends out by accident high-priced seeds or plants untrue to name, thus entailing loss and disappointment on the purchaser.

If it was as purely accidental as the two cases mentioned above; if the accident was something that human foresight could not have prevented, or foreseen, like the changing of the wind that caused the hay-stack to burn; then I should say "no" to the second question. But, as a rule, and practically always, are not these "accidents" caused by the carelessness of some of the employés of the seller? If they are, he should certainly be held strictly accountable for them. He put his employés in a position where they could injure those who bought of him.

But now comes the question: "What would be a fair basis for a settlement?" There is the rub. From the nature of the business, the carelessness of one man, for a single day, might get a seller, if he is to be held responsible for all damages, into no end of trouble and lawsuits, from one end of the country to the other. To enforce this seemingly just rule would drive every man out of business, for he never would know when he was safe. What can be done, practically? The seller should be responsible, always, to the amount of what was paid him for plants or trees. This would insure all reasonable precautions against carelessness. Then he might say to the buyer: "In consideration of your taking all risk of accidents, beyond those that would be covered by the cash paid me, I sell you the goods at such and such prices." The buyer buys on this basis, and, of course, far cheaper than any reliable firm could sell to him and positively guarantee them all right or they would pay all future damage.

Certainly little or no business would ever be done in this line if sellers were to be held for consequential damages in case of carelessness, although when one looks only on the other side this seems but right. But the buyer must remember he is not buying on such a basis of prices. He gets his trees cheaper because the contract is limited; just as he buys a railroad ticket cheaper because it is limited, or sends his produce to market at a certain low rate, partly because the company does not agree to get it there in time for any particular market. He must take some risk himself, or pay an extra price for sending his stuff on a time freight. For the extra pay the company takes the risk.

FROM HENRY STEWART.

The question of purity and freshness of seeds is a very serious one to farmers and market gardeners. Some enormous losses—in the aggregate—are incurred every year by failure of seeds, and I believe these failures are not so much the fault of the farmers as of the sellers of the seeds. Some guarantees are, of course, very desirable, as in other kinds of business, in which the seller is held responsible for the genuine character of his wares. But what guarantees are possible in this respect? It has been thought, that if a farmer—as I have done—goes to a large expense in preparing and fertilizing some acres of land for any crop—let us say mangels—and purchases a lot of seed, which from its nature, (as with mangel or beet seed) may be apparently good when it is entirely worthless, only empty capsules being left instead of well filled ones, the farmer is entitled to be repaid all his loss by the seller of the worthless seed, who may be himself perfectly honest, but has made a mistake—perhaps through one of his salesmen. This, however, involves the question of indirect damages, which I believe the law ignores in great and small cases, from the well-known Confederate cruiser case against England to the sale of an ounce of cabbage seed. The legal maxim, *caveat emptor*, "let the purchaser look out for himself," applies, and the United States Courts have so settled cases brought before them. It may seem to be unjust, but looking at it impartially, it seems that if the purchaser will not take the trouble to examine the seed carefully and test it, before sowing his land prepared at large expense, he is not doing his share of the mutual duty and obligation.

Certainly if any seedsman sells, even unknowingly, any imperfect or wrong seed the least he can do is to return the money paid for it, under certain conditions; and these should be the return of the package within a time sufficient for the purchaser to test the seeds. But even this is open to objection. The purchasers frequently do not know how to test many seeds, and some ignorantly kill the seeds in preparing them for sowing. I have known cases in which boiling water has been poured upon corn for the purpose of hastening the germination, and of other very hard seeds being sown without this preparation which would have hastened their growing.

Every seedsman, I think, should stake his reputation upon these guarantees; first, that the seeds have been grown by competent, careful and experienced persons, with every care to prevent mixture, and in the best manner to procure healthy and vigorous growth; second, that all seeds sold are fresh, and no old stock that may have lost the power of germination by age or by ravages of vermin of any kind, is offered for sale. Similar guarantees should be given as regards plants, shrubs and trees.

If an accident happens and loss is incurred by the purchaser, the seller is now held liable by the common law for the direct damage sustained, and any respectable seedsman would no doubt make due reparation for such loss, taking into account, of course, the offset of whatever part of the loss should fall upon the purchaser for his carelessness in certain circumstances. It is easy to test seeds and the purchaser ought to do this before he sows them. If he fails to do this he necessarily waives any claim upon the seller in any way. If he tests them and finds they have been damaged, or are old and worthless, he has a just claim to get his money back on return of the seeds at the earliest practicable moment.

With fruit trees there is much more uncertainty and greater necessity for some trade regulation. If a man sells 100 Bartlett pears or Baldwin apples and the purchaser has no means of verifying the truth of the labels on the trees, and after waiting seven or eight years, finds he has other and inferior trees, he has been very seriously wronged, and has a just claim to compensation. The law would give him damages to the amount of the difference in value of the trees, but no more; but what would be a fair basis of settlement is exceedingly difficult even to suggest. I rather think the whole business is something like a man trying to jump a ditch in the dark; he may land all right on the firm ground, but he may go up to his neck in the slush midway. He takes the risk, which, however, is very small when he deals with well-known persons. I have been buying seeds, plants and trees largely for more than 30 years, and have had only one "accident," which I would have discovered had I been careful.

A BUCKWHEAT POINTER.—I prepared a field for sowing buckwheat. On July 7, 1888, I sowed half of it with "Japanese Buckwheat," and on July 10, I sowed the other half with the common buckwheat. One of the best farmers in this town laughed at me for getting it in so early. He said that July 18, was as early as he thought it profitable or safe to sow buckwheat in this section. The exceptionally early frosts of 1888, blighted his buckwheat, while from my Japanese I saved a splendid yield of first-quality grain; but the common kind by its side was white with bloom when the frost spoiled it. Only two farmers showed buckwheat at our town fair. Mine took the first prize, and richly deserved it. E. A. M.

RAISING MANGEL-WURZELS.

L. B. S., East Springfield, N. Y.—I am going this spring to raise two acres of mangel-wurzels, on a deep limestone loam with a loose sub-soil. The land was plowed last fall to the depth of eight inches, and manured at the rate of 60 two-horse loads to the acre. I intend in the spring to spread on the manure 200 pounds of Cayuga plaster, brush-harrow thoroughly, and then plow it under about four inches. I will then sow 600 pounds per acre of salt and 1,000 pounds per acre of Henderson's rotten bone manure, harrow thoroughly with an Acme harrow, and roll. I have chosen the Henderson Colossal Long Red mangel for planting. Now, what I want to find out is, whether I can raise a larger crop by planting in rows 30 inches apart and thinning to 14 inches in the row; or by planting in rows 21 inches apart and thinning to 21 inches in the row. There is little difference in the number of plants. In the latter case, I will cultivate both ways with a Planet Jr. hand-cultivator, and the labor will be greater than it would be if I could use the horse-cultivator. But I am willing in this case to take the extra trouble if I can get a larger crop.

ANSWERED BY GEORGE AITKEN, MANAGER BILLINGS FARM.

The raising of mangel-wurzel should never be attempted on a flat or level surface, as it is almost impossible to grow a profitable crop on such land. This is one of the reasons why so few farmers raise this crop in this country. The land being prepared as L. B. S. proposes, should then be thrown up into ridges about 27 inches apart. This is done by running the plow moderately deep and leaving about 27 inches between the furrows, which should be done by an experienced plowman, so that the ridges will be exactly the same distance apart throughout their entire length. The seed is then sown on top of the ridges and rolled lengthwise of the ridge with a common roller. Just before the plants appear, it is well to go over the piece with a light dressing of nitrate of soda—about 100 pounds per acre—sprinkling it only on top of the ridges, which will give the young plants a good start ahead of the weeds. As soon as the plants appear the cultivator should be started with the teeth set slantingly so as to leave the ridge narrow on top and wide at the base, and if the ridging has been properly done the cultivator may be set within an inch of the plants on each side leaving the ridge only two inches wide on top. When the plants are about three inches high they should be singled out to about 10 inches apart by striking a hoe across the top of the ridge. This is where a great many fail in growing roots: they are too careful not to disturb the plant. I have seen them carefully pull the plants away from the one left standing so as not to disturb the ground around the growing plant, which is a mistake, as the soil ought to be taken away to a depth of an inch and the plant allowed to fall over. There is no danger of killing it, as the root has struck down three or four inches by this time and by taking the soil away in this manner, we get rid of the weeds and no more hand hoeing is needed, as the horse cultivator will do all the rest. This is the method I have practiced for the last 20 years, growing from two to five acres every year, and very few crops have yielded less than 30 tons per acre, while some have gone as high as 40 tons, and they have never cost over four cents per bushel.

HUSKING CORN BY MACHINERY.

E. B. S., Hydetown, Pa.—I would like to hear from Mr. A. C. Glidden in regard to the work he had done with the corn-husker which he fully described in the RURAL of December 15. How about his mow of cut fodder? If it did not all spoil, I want to know how he packed it.

ANSWERED BY A. C. GLIDDEN.

I think I fully described the work of the husker in the article alluded to. I find occasionally an ear with the husks on as I am feeding the corn, but it is cleaner than the average of husking. But I must now disclose the fact that the machine did not do as perfect work husking later on, when the husks had become perfectly dry, and the husking pins had become somewhat worn. The grasp on the husks was uncertain when they were dry. Some improvements are necessary to hold the ear down rather than to allow it to rest on the huskers by its own weight entirely. I am feeding on the last one-third of the cut fodder and so far it has all been eaten except to the extent of a dozen bundles perhaps on the front side of the bay where it kept wet until it froze. The mow steamed some for three weeks, but I kept the doors shut to the barn. If perchance they were opened, if only for a few minutes, the fermentation would increase, in the same manner that fresh air adds to a blaze. The barn is battened tight, and some hay was placed in the bottom of the mow, so that no draft of air could come from below. I have been feeding off the mow every day this winter, and find the fodder has kept perfect, except just in front, and where I stood under the carrier to throw the fodder back. Here it has been somewhat moldy from top to bottom. I think the heavier parts of the fodder were left here—the piths of the stalks that held the most moisture. These were packed hard, and the water could not

escape so well. I fed from this moldy place this morning on purpose to see if the stock would eat it. The sheep sniffed at it rather daintily, but the cows ate it as well, seemingly, as any part of the mow. Along the front of the mow it is discolored somewhat, but on the back side and ends it looks as fresh almost as when it was placed there. I am thoroughly pleased with this way of managing corn fodder, and shall never handle it in bundles again. I had a few loads husked by hand before the machine came, and it seems more of a nuisance than ever after feeding this prepared fodder.

TREATMENT OF GULLIED, LEACHY HILL-SIDE: A HOME-MADE HAY PRESS.

J. W. F., Pike Co., Ill.—1, I have just taken a hilly piece of land on which the hill-sides have been washed into big ditches some of them 20 feet deep. Some of them are close together. The soil is a light clay very easily washed. Brush and straw are very scarce; what is the best way to bring the field into grass, or make it tillable. The land has been abused till the life seems to have been knocked out of it. 2. Is there any hay press for $25 or under for farm use?

ANS.—1, Deep plowing will prevent washing by affording sufficient absorbent soil to take in the water. The land in such a case should be plowed across the slope to avoid making channels for the water to gather. A plan that would no doubt put the land in question in good order again would be as follows. Plow the gullies from top to bottom, beginning at the middle and finishing at the sides. One horse may be used by employing a light hill-side or swivel plow and going back and forth. When the sides are reached the process is repeated until the hollows are filled as nearly as may be; then the other land should be plowed with the same plow, beginning at the bottom and going back and forth. Then sow clover, with oats or millet or buckwheat, to afford some resistance to the heavy rain until the clover has taken a stand. After the clover has stood a year or two, the land should be plowed again wholly across the slopes, if possible, and sown to Orchard grass and clover and Blue-grass seed may be sown with these; Red-top would make a substitute for the Blue grass if thought more desirable. Such land should be kept in grass, and Orchard grass and Blue grass are the most permanent varieties for this kind of soil. 2. No hay press in the market can be bought for $25, but a very good one can be made by any carpenter, to be worked with a lever with pawl and ratchet-wheel to raise the bottom of the press. The sides of the press must have openings in the proper places to put in the wires for binding; strong tarred strings may be used, that could be saved for another season and are not dangerous as wires are.

WHEAT BRAN AND BUCKWHEAT BRAN FOR MILCH COWS.

W. W. S., Denton, Mich.—Which is the cheaper feed for milch cows—wheat bran at $15 per ton or buckwheat bran—with middlings—at $13? My coarse feed is drilled corn, some of which is heavily loaded with ripe ears, run through a cutting box and mixed with a little cut straw. I also give one feed a day of bright hay. I am feeding from six to eight pounds of bran per day. Is that amount enough for a 1,000-pound cow giving a full flow of milk, cream being the object?

ANSWERED BY HENRY STEWART.

Buckwheat bran is a nutritious feed and so are the middlings of this grain; but this feed makes a poor quality of butter. Wheat bran is a better food for cows although it bears a less proportionate value than buckwheat bran in the ratio of $1.01 to $1.15 per 100 pounds for its nutritive elements; but it has better results in regard to the quality of the butter, this being of a better color and texture. With the corn in the fodder, six to eight pounds of bran per day are quite sufficient, if the corn—which is whole—is all digested. This, however, is doubtful, judging from experience in feeding such fodder or whole corn. Whatever corn passes through the animal is, of course, wasted; hence I would suggest that four pounds of corn-meal and four pounds of bran should be given rather than eight pounds of bran. Under similar circumstances I have found this the best feeding for cows kept for cream and butter. The coarse food is excellent except for the objection in regard to the escape of some of the grain in it from digestion.

GRASSES FOR PERMANENT PASTURE; OAT CHAFF AS FEED.

B. K. A., New Providence, Pa.—1. I want to plow a piece of ground and sow on it oats for a permanent pasture. Clover soon freezes out and Timothy soon dies out. A part of it is upland, and a part of it sometimes wet. 2. Will oat chaff injure a horse if mixed with chop and made wet.

ANS.—1. For permanent pasture mixed grasses are more desirable than any one kind. But as some of the best grasses do not reach their best stage the first year it is better to sow some clover—say, six or eight pounds with six of Timothy, 18 of Orchard grass and 12 of Red-top, which would make a good mixture for both dry and moist land. From the fact that this land freezes out the clover and most probably the Timothy, it evidently needs drainage. This might be afforded by plowing it in flat lands four rods wide, with open furrows between them; these furrows should be plowed twice, and deepened, and made broad so that a wagon would pass over them easily, and they would, if plowed right as to the slope, carry off the surface water. 2. Oat chaff is more nutritious than any other kind of chaff, being softer and more digestible. It has no injurious properties, and horses eat it very readily; but it would be better eaten if a little cut hay were mixed with it. The only objection to its use as mentioned is that when wet and mixed with chop, or coarse grain feed, it would be swallowed without sufficient mastication, and ferment in the stomach and cause indigestion and a fit of colic.

SEEDING TO GRASS ON AN "OLD FIELD."

Subscriber, Elva, Va.—How can the best grasses and clover be grown on an "old field" without plowing and sowing with a grain crop? Will it do to harrow the existing coarse grass thoroughly, sow 400 pounds of bone-dust per acre, then sow the grass and clover seed and roll?

ANS.—Grass and clover require as good preparation of the soil as any other crop, if not a better one. We consider grass and clover, or either alone, the most important and valuable of all crops, and for this reason, if not for the fact that they insist upon it, the best preparation should be made for them. It is impossible to get a satisfactory stand in the manner suggested. Our plan would be to plow the land, turning under the present coarse growth, make the soil fine and compact by thorough harrowing with a light sloping-tooth harrow, or one that cuts rather than tears the surface, so as to avoid disturbing the sod; and sow a peck o clover seed and the same of Timothy or two bushels of Orchard-grass seed, without any grain crop. This should be done as early as possible. A plank drag to smooth the surface and cover the seed, or the light sloping-tooth harrow would finish the work. In the fall there would be a good growth that might be pastured down and a full crop of hay the next season. Orchard grass would make a meadow that would last many years with an occasional top-dressing of manure and a little fresh seed now and then.

WOOL WASTE FOR BEDDING AND MANURE.

P. G., Oswego Falls, N. Y.—Is wool waste good bedding for horses and cows? What is the best way to use it, and with what should it be mixed to make a complete fertilizer?

ANS.—Yes, it is excellent for bedding. This is one of the best ways of utilizing this valuable material. Wool waste is rich in nitrogen, sometimes containing as much as 12 per cent. The trouble is that it decomposes so slowly, when left to itself, that its nitrogen is not readily available and consequently its value is rated below that of other substances containing less nitrogen in a more available form. When stock are kept on hard floors, the wool waste may be used to absorb the urine. This it will do exceedingly well. It may then be composted with horse manure, or it may be composted with wood ashes. We have been trying a small experiment in this line the past winter. A quantity of old rags were to be "reduced." A part of them were placed in a box with horse manure, first a layer of manure, then a layer of rags and so on. The rest were placed in a large barrel with layers of ashes in the place of the manure. Liquid manure from the stable is poured over the tops of the two receptacles from time to time. To the ashes and rags we should add bone meal in the spring.

DISARRANGED BAROMETERS.

E. B. S., (No address).—What is the matter with my mercurial barometer? After a faithful service for 16 years, last summer the mercury all of a sudden began to rise and in about six hours it had all climbed into the top of the tube where it has remained ever since. The barometer is firmly fixed to the house, and has never been meddled with since it was fixed there. What is the matter with the mercury?

ANS.—After 16 years of service probably the cistern of the barometer got disarranged and admitted air, after allowing some of the mercury to escape, the air taking its place. The remaining portion of the mercury is held in the position described, by the pressure of the atmosphere, there being a vacuum at the top of the mercurial column. The pressure of the atmosphere, being greater than the weight of the mercurial column, it has pushed the latter up and holds it in its present position. It can be set right only by an expert implement maker. Guiseppe Tagliabue, 302 Pearl St., New York City, can do the job in first-rate style.

HOW TO FIND THE NUMBER OF BUSHELS OF CORN IN A CORN CRIB.

L. H. W., Welcome, W. Va.—How many bushels of corn in a crib 25x6x6 feet?

ANS.—361 shelled or 722 unshelled. A rule is to find number of cubic inches in the crib and divide by the number of cubic inches in a bushel. In this problem we would have 25x6x6x1,728 = 1,555,200, divided by 2,150.4 = 722. It is customary to allow one-half for the cobs, so that to find the bushels of shelled corn we would divide by the number of cubic inches in two bushels—4,300.8. Another rule sometimes used is to multiply the number of cubic feet in the bin by four and mark off the right-hand figure. This gives the number of bushels of shelled corn.

THE NEW QUEEN POTATO.

S. M. B., North Cohocton, N. Y.—Is G. W. P. Jerrard's New Queen potato so much better than the Early Beauty of Hebron as to justify an ordinary farmer in paying the difference in price for seed for a field crop this year?

ANS.—Here is the R. N.-Y.'s report not hitherto published:—New Queen; from Geo. W. P. Jerrard, Caribou, Maine. Two pieces gave a yield (in two hills) of 10 pounds in our rich garden soil, which is at the rate of 1,210 bushels to the acre. There were 21 large; four small tubers. Light skin, medium in length, cylindrical, shapely. Eyes not deep. Quality not tried.

SODA ASH AS A FERTILIZER.

E. S. L., Buffalo, Ia.—Has soda ash any value as a fertilizer?

ANS.—Professor Collier, Director of the New York Experiment Station, at Geneva, to whom this question was referred for an answer, writes us: "We are at present experimenting with soda ash, and hope to be able to speak concerning it from results of personal experience soon. It is not unlikely that through a chemical action upon the soil constitutents it might prove a very valuable indirect fertilizer."

GLUTEN MEAL.

W. S. H., Easton, Pa.—What is gluten meal?

ANS.—Gluten meal is the refuse from starch or glucose factories. It contains the hull and germ of corn with a portion of the starch. As the hull contains all the fat of the grain and the germ contains most of the nitrogen, it will be readily seen that gluten meal is a nutritious and healthful food for stock.

Miscellaneous.

J. S., Drysdale, Canada.—We think you can obtain the peas from any of the leading seedsmen.

H. F. S., Ceres, N. Y.—Potato boxes like those used by Mr. Terry, can be procured of A. I. Root, Medina, Ohio.

J. B. T., Whiting, Maine.—Bulletin L., of the New Jersey Experiment Station, can be obtained from Prof. G. B. Hulst, New Brunswick, N. J.

J. A. B., Butler Center, N. Y.—I have a flock of hens that have scales on their legs; what shall I do for them?

ANS.—Mix equal parts of lard and kerosene oil, warm slightly, and apply for several nights after they have gone to roost.

L. O. Q., Goshen, N. Y.—What varieties of strawberries are best for a rather heavy soil for family use? 2. What muskmelon is best for home use?

ANS.—Try Prince, May King, Charles Downing, Miner, Bubach and Louise. 2. Emerald Gem. It is small but delicious.

J. E., Warren, Conn.—Are pumpkins of different sexes and, if so, how can the sexes be distinguished? From which should seed be selected?

ANS.—Yes, each vine bears both female and male flowers. Now, as only the female flowers can form fruit, it doesn't matter as to selection.

H. C. B., Westernville, N. Y.—Is it worth while to get a wheel cultivator and seed drill for a family garden of about half an acre? Which would the RURAL recommend?

ANS.—There are a dozen different kinds. The Planet Jr. Combined will suit you as well as any. Yes, indeed, this implement in such a garden will soon pay for itself. See any of the catalogues announced.

J. B. D., Eldred, Pa.—Last year I seeded about five acres to clover and Timothy with oats, using fertilizer at the rate of 300 pounds to the acre. The land being somewhat run down, I got a very poor stand. I have covered it with stable manure and intend to sow more grass seed; had I better sow it now on the snow or wait until the ground dries, and run the harrow over it.

ANS.—We would prefer the latter.

D. L. O., Logansport, Ind.—1. What is the best practical work on carp culture? 2. What is the best work of moderate cost on the diseases of domestic animals and their treatment, for non-professional use?

ANS.—Send to the United States Fish Commissioner for the pamphlets printed by the Government. 2. Law's Farmers' Veterinary Adviser; price $3. To be obtained from Professor James Law, Cornell University, Ithaca, N. Y.

A. L. R., Horseshoe Bend, Idaho.—Will the Agricultural College of Michigan accept students residing outside the State? If so, under what conditions? Though a surveyor and engineer, I am a great lover of farm life. I was reared on a farm and have one of my own. There is a great opening here for true farming. There is too much haphazard farming all through the great West. I now seek a place where I can prepare myself for the work and better management of a farm?

ANS.—Agricultural College P. O., Ingham Co., Michigan, is the address of this college. Students are admitted from any State or country. The examinations are alike for all.

J. W., Sand Lake, N. Y.—I have 60 hens in a hennery 13x14 feet. In spite of warmth and good care I can get only from three to eight eggs a day. The hennery is cleaned twice a week, warm water is given to the hens each day, and they get warmed corn for the first meal, and boiled potatoes mixed with meal at 4 P. M. Oats and bone-dust are sometimes fed, and a dust-bath is provided. The birds look in fine health; but a couple of weeks ago they had cholera, when I fed lime and salt with the feed, and they are now all right. My neighbor gets 28 to 30 eggs a day, feeding corn and loppered milk. Is tar-paper a good lining for a hen-house?

ANS.—The food given is too exclusively carbonaceous causing a tendency to fatten. Vary the diet lessening the grain one half, and allowing a plentiful supply of clover, chopped fine, and scalded, in the morning, with butchers' meat—a pound to 15 hens—three times a week. The tarred paper will be found excellent.

J. W. (no address).—Is crude petroleum a fertilizer for grass or any crop? During last haying season I mowed with a scythe a very heavy crop of grass on land at the bottom of which was a small hollow at the head of which was a fine spring of water. The hollow was very wet and on the surface of the water was a "scum" that looked like crude petroleum. After working all day in the water, my boots used to be completely soaked, and next morning they looked as if they had been oiled—why?

ANS.—Neither petroleum nor any other oil, or fat, is a fertilizer, as none of such things contain any essential elements of plant food. It is most probable that the oily matter referred to is a very common product of decomposition of vegetable substance of which swampy ground contains a large quantity. It is quite common to see this oily matter spread on pools of stagnant water in marshes, giving brilliant iridescent colors similar to those afforded by crude petroleum, and this quite common occurrence sometimes affects people with the old-fashioned "oil fever." But this is not petroleum, though it is so often deceptive. Marshes abound in hydrocarbon products, as marsh gas, and this is probably a condensation of it.

DISCUSSION.

IN FAVOR OF LIME.

H. T., ERIE, PA.—I was very much interested in an article, in a recent RURAL, on lime as a soil improver. It recalls to my mind my own experience with lime. About 15 years ago I took charge of an old garden, and was told by my gardening friends, that I had struck, a poor place that I need not expect to grow good fruits and vegetables in that garden, for the land was worn out. It was strawberry-sick, raspberry-sick and everything-else-sick. I speedily found that the soil was very unproductive; peas were all vines; potatoes were all tops; onions invariably ran to scallions, and on inquiry I found that this had been the case for years, not a good prospect for a young and ambitious gardener. I set about at once to find the cause of this

state of thinsg. Neighbors told me the land was worn out. Now how could that be? It certainly was not for the want of organic matter, for the soil was full of it. Large quantities of leaf mold had been used annually; cow manure, horse manure and pig manure were used in abundance. The land was full of manure which from some cause or other failed to give good results. Suspecting the cause, I ordered a quantity of lime; but was met by the owner of the land who forbade me to use even a small quantity, "Lime" he said "is a positive injury in this district, and I have never allowed any lime to be brought on my land. Why, the crops would all burn up." But I was more than ever satisfied that lime was necessary for mixing with the black mass of humus contained in the soil, not as a fertilizer but as a solvent for liberating the stored-up forms of plant-food and rendering it available for the support of the crops. The soil was full to repletion of food for plants, but that food was sealed. I asked and at last obtained permission to withhold manure from a small part of the garden only, and to use lime instead. Note the results: on that part of the garden where the lime was used, there was an immense yield of large, clean potatoes instead of small, waxy, grub-eaten tubers previously obtained. The onions were the finest grown in that neighborhood, and when I returned from the local Horticultural Exhibition with several first premiums, my employer was forced to own that for once he had been mistaken, and he gave me free permission to use what kind of manure I chose in future. Next spring the whole garden was limed at the rate of 30 bushels per acre and no manure of any kind was used for three years, with surprising results, and although I am many miles away from the old place now, I hear it still has the reputation of being the best garden in the neighborhood instead of being the worst. The land was full of unavailable plant food and lime was the necessary agent to render it available.

I think the RURAL correspondent is mistaken in expecting the same result from lime contained in bone as would be obtained from an application of 30 bushels of quick-lime per acre Less would be useless. One thorough application should last for several years. My plan of applying unslaked lime is as follows: The ground is paced off and a bushel-basketful is emptied at regular distances over the field. Then with a shovel I throw enough soil over the lime to completely exclude the air. The natural dampness of the ground will be all the moisture necessary to slake the lime. For the job, I always choose fine dry weather. Then I watch carefully until the lime will fall to pieces the size of walnuts, when I at once spread and plow it in hot. It is not spread faster than I can plow. The chemical action of lime used in this way will have an altogether different effect on the soil, from that of slaked lime or the refuse from the kilns. My advice to my agricultural and horticultural friends is to give lime a trial on a small portion of their land, even if they do think it already contains all the lime that is necessary. One should not by any means use lime extensively at first; he should use only enough for trial, and note the result. In some land a vast amount of wealth is locked up and lime is the key to unlock it.

RAINBOW-CHASING IN AGRICULTURE.

E. T., EDWARDSVILLE, KAN.—Referring to the Manure Symposium in the RURAL of February 16, I wish to ask whether the manurial values given by Prof Roberts have ever been verified by crops? He estimates the voidings of a 1,200-pound cow, fed a given ration, to be worth 16 7-9 cents a day, which would be $61.23 per year. Those figures are much above the returns of the average farmer from that product. I suspect they are too large by several diameters. An out-door test of their correctness on a scale large enough for comparison, would be interesting. Might one inquire how the Professor knows that manure for corn is best applied "fresh," in the spring? What corn-field data has he in support of that practice? For my part—for corn—I would not haul and spread in the spring fresh barn-yard manure if it were given me. He touches lightly upon the "best method of treating manure:" *viz*, by rotting it in a water-tight pit, with a cistern for catching the drippings, which are to be pumped back upon the heap now and then. It would be mighty entertaining reading, if, speaking in the past tense, he could tell us how much wheat, for instance, 100 cords of manure, so treated, *did make* over the yield produced by 100 cords of manure not composted, the other conditions being identical, giving the cost of composting, and the comparative expense of applying the two lots of manure. When a boy, I was greatly excited over that same scheme as set forth in "Bohmer's New Method of Making Manure." But my father had small faith in innovations put forward without a backing of fact, and discouraged my chasing after every rainbow that an agricultural writer said "might, could, would or should" be caught; when the writer himself had caught one, I had leave to try. If this particular specimen has been captured, I hope the RURAL NEW-YORKER will give us all the particulars

WATER FOR FATTENING CATTLE.

H. STEWART, MACON CO., N. C.—J. B. P. seems in a late RURAL to object to my remark that fattening steers should be *well* supplied with drinking water of a *moderate* temperature and I italicize these two words because J. B. P. completely mistakes my meaning and very unfairly suggests an application of the term the very reverse of what was intended. "Well supplied" is properly supplied; neither too little nor too much. Water of a moderate temperature is not ice-cold, which would largely increase the consumption of food, arrest digestion and prevent fattening cattle from making the most of their food. And then he quotes Prof. Armsby against the excessive drinking of water, which is not at all or in any sense applicable to my remarks and my advice that cattle should be well supplied with water of a moderate temperature. If J. B. P. thinks it best to give his cattle ice-cold water to prevent them from drinking too much, he will very soon find his mistake in his cattle shivering, with their hair standing on end, and wasting food and losing money for him. Possibly he will be better satisfied if I explain that a moderate temperature, in my view and in the sense in which I used the word, is just that at which water comes from a well; (the animal will be *well* supplied then in a double sense) and not from a trough or from a stream through a hole cut in the ice. Fattening animals should have just what water they will drink when supplied to them twice a day, and they will never drink any more than is necessary for them. I have now a few head of steers being fattened by stall feeding. They are fed on cut hay wetted and mixed with corn-meal and dry hay and dry meal alternately. They are supplied with water fresh from a running spring and some days they will not drink at all, while on other days they drink half a pailful, but it is offered them, nevertheless, and that is what I call being well supplied.

CHINCH BUG DISEASES.

J. R. H., WELLSVILLE, KAN.—I think that all other insect pests together do not do to the farmer of Eastern Kansas half the damage done by the Chinch-bug. Hence any practical plan that would destroy the pest would be very welcome. The disease spoken of in the RURAL of February 9, will not, I am afraid, help us, because this fungoid disease (we call it mildew) has been here for years, and yet the bugs are as plentiful as ever when the conditions are favorable. We never fear the bugs in a wet season. We are told that at the Iowa station "It was found by experiment that the disease was readily communicated from diseased to healthy bugs when the necessary conditions of warmth and moisture were obtained, but in dry, exposed places the disease would not spread, no matter how abundantly the disease germs were scattered about." That I think is all there is in the disease. Anything will mildew if you keep it warm and wet long enough. The idea of preserving dead bugs and grass where they have died, I think is anything but practical, because it is admitted that the disease will not spread unless the weather is favorable. Bugs do the most damage when the weather is dry; then they are very healthy. The only remedy I have to suggest is to burn over all the ground that can be burned, and where it can't be burned to rake the trash, and then burn it. This should be done in the fall after the bugs have gone into winter quarters. The burning will not kill so many bugs, but it will leave them exposed to the weather which will kill most of them by spring. I think this plan will work if it is extensively practiced, but there is the rub. Farmers will not unite in an extensive plan for their own interest.

ROADS AND ROAD MAKING.

W. V., FRANKLIN, N J.—I see on page 96 of the RURAL that the Vanderbilt University at Nashville, is to give free instructions in road-making to Tennessee county highway officials. This is a matter that interests most of us and I hope the RURAL will pay attention to it. It interests us as tax-payers, freighters and travelers. I also see by a late RURAL that the New Jersey legislature is trying to have the principal roads under the supervision of the freeholders, which is well if the work is done economically. As a tax-payer of New Jersey for nearly 50 years, I would make a few suggestions. Don't do too much grading. Don't disturb the old bed of a road when it can be avoided. Don't argue that a road needs to be wide to prevent rutting. You don't find ruts where the travel is considerable and wagons often meet or where the grade is sufficient to press the wagon against the team.

What Others Say.

GIRDLING GRAPE VINES.—On the 13th of September last, remarks a writer in Garden and Forest, an excellent opportunity was afforded to a committee of the Massachusetts Horticultural Society to observe the effects of the process of girdling the branches of the grape for the purpose of hastening the maturity of fruit. Among other vineyards, they visited one situated in the south part of Concord. On the southern slope of a hill which runs down to the river they found a plantation of several acres of Concords. The elevation was about 75 feet above the level of the river. The plants in the eastern half of the vineyard had been girdled for this and the two preceding seasons, while those in the western half were growing in their natural way. The girdled plants were more irregular and thinner in foliage, and upon general view, did not look as vigorous as the normal growth. A closer inspection showed that the girdling process had been severely practiced upon every fruit-bearing branch, producing a very marked effect in developing the size and hastening the maturity of the fruit. Though the season was so late and unfavorable that they found Moore's Early, in this and in other vineyards, to be barely ripe, yet the girdled Concords were in quite as good condition. On the other hand, the Concords of normal growth were much smaller in size and hopelessly behind time. It was evident then, as the event proved, that the natural crop would be ruined by frost. Here was an instance of a crop saved by girdling, and of another, side by side, which was lost by neglect of this process. Without going further, it is then evident that, under some circumstances and with some varieties, there are decided advantages in the process. Such excellent varieties as the Iona and the Jefferson may be hastened to maturity by girdling But in ordinary seasons we should scarcely think it worth while to be at the trouble to hasten the Concord, when we have equally good varieties, like the Worden and the Moore, which are early without this treatment. Yet there is a larger development of the fruit by the process, which is of much importance to the marketmen. This is so material a consideration, that it would be likely to govern were it not for another consideration which must be taken into account. What will be the permanent effect upon the vineyard of a continuation of this process? In the instance before us the work had been so thorough, not to say severe, that the effect upon the future of the vine could be predicted with confidence.

Not only were the branches above the ring largely developed by the arrest of the descending sap and also the limbs below seemingly shrunk to the size of a pipe stem, but the renewal-canes appeared to have an enfeebled growth. It was evident that the saving of the crop was likely to prove a serious injury to the health of the vineyard. But this was an extreme practice, where the crop had evidently been treated as of prime importance, and the renewal-canes had been neglected. But this by no means determines whether a judicious use of this method may not often prove harmless and of great practical advantage. Our native grape is so superabundant in the production of foliage that checking becomes necessary. The fact, also, that a large amount of old wood has to be removed every autumn, has a bearing upon this question. Add to these the consideration that the renewal-canes, under proper encouragement, will give a large supply of nourishment to the roots, and it does not seem unreasonable to conclude that a moderate portion of the descending sap may be arrested just below the fruit without material injury to the vine. Indeed, the case which has been here cited, and many similar ones which are known, so far from disproving, rather go to prove that a well-considered and moderate girdling would often result in decided advantage. At all events, it is desirable that there should be continued experiments in this direction.

COPPER SULPHATE AND LIME SOLUTION AS AN INSECTICIDE.—The Hans and Bauernfreund, of Milwaukee, Wisconsin—a German farmers' weekly—states that by accident it has been found that the copper sulphate and lime mixture which has lately proved so useful against grape mildew, is also deadly to insects generally. F. Bascarolli, a grape-grower in the Tyrol, had sprinkled his vines in June, but a shower washed them soon after. A second sprinkling was given in July. Grasshoppers abounded in the vineyard and after the copious sprinkling they were found hanging dead to the vines and stakes, and other insects with them. The common naked snail (slug), so injurious in gardens, dies directly, it is said, if touched at all by the very dilute solution; the proportions of which are given as an ounce and a-half of sulphate of copper (blue vitriol), dissolved in hot water and then diluted with cold to four quarts; three ounces of lime made into a thin white-wash with four quarts of water. Mix these after straining, making two gallons. Apply with any sprinkler. This will serve for a trial. It is strongly recommended for use on potato-tops against the rot, and is said to have proved fatal to the beetles, also to currant worms.

VALUE OF TREES IN GERMANY.—In stories from German farm life in the same paper, the great value set on trees in Germany, comes to view. A boy, ill-treated on a farm and burning with revenge, can think of nothing that will secure it so well as cutting down some trees. The foresters are important personages there, and have police power. They have as much trouble in saving their wood and securing its growth as they have in guarding the game. Country families who work during the winter season at carving kitchen utensils, furniture, toys, etc., for sale, are closely watched, for they are given to taking the wood they use without asking or paying for it.

THE IGNOTUM.—The "Ignotum" tomato, according to Prof L. H. Bailey (excellent authority), in the American Garden for March, has a promising future. It may be said to be a sport of the German variety called Eiformige Daner, seeds of which Prof. Bailey imported while he was Professor of Horticulture in the Michigan Agricultural College. In 1887 one plant bore "fruits of remarkable beauty, solidity, size and uniformity. Among about 170 sorts shown that year at the State Fair, this was the best." Prof. Taft, Mr. Bailey's successor, is inclined to think from last season's trial, that it deserves a front rank among tomatoes. As compared with Mikado, it is larger, smoother, more solid, less subject to rot, more productive and more desirable, both as an early and late variety. Prof. Taft has several hundred plants growing on a dry, sandy knoll and, although it was a dry year, the plants gave a very heavy crop, and continued ripening until the frost destroyed them about the first of October. The Ignotum still sports somewhat, for which reason Prof. Bailey hopes that seedsmen will not offer it for sale until it becomes fixed.

PITHS AND REMINDERS.

MR. LIBBY very appropriately calls the seedsmen's catalogues "Paper Gardens."....

PRESIDENT LYON, in the Michigan Farmer, very sensibly objects to calling Simon's and Pissard's plums, Prunus Simonii and Prunus Pissardii. The objection to such use of these names consists in the fact that such appellations are strictly botanical terms, indicating distinct species, the application of which to mere varieties is a usurpation and misuse of scientific terms, calculated to mislead those who may not have acquired a previous knowledge of the facts in the case.....

A WRITER in Popular Science News says that one morning he found on his plate at the breakfast table a boiled egg, evidently reserved for "papa" on account of its unusual size. On breaking the shell he found a liberal amount of albumen, but no yelk. Instead of the yelk was a fully-formed medium-sized egg, with a shell of ordinary hardness, containing albumen and yelk as in any ordinary egg. Upon inquiry, he learned that the egg had been procured from a neighbor's poultry-yard, and that the hen which produced it had laid one or more other eggs of an abnormal character, but he was unable to learn in what the deviation consisted .....

TO KILL the cabbage-worm, hot water from 140 degrees to 160 degrees, is again coming to the fore as a most economical remedy. The trouble is, not to kill the cabbages as well as the cabbage-worms.....

AT the Wisconsin Dairymen's Annual meeting, as reported in Hoard's Dairyman, Prof. Robertson said he had proved there was a loss in churning cream sweet rather than slightly acidified. In 100 parts of butter in cream, 97 were obtained in acid cream, while but 77 parts were secured in sweet cream.....

MR. JOHN BENDER asked the Professor how much water he would add to cream that was one-fourth butter, before the cream was churned. Reply: from 15 to 25 per cent. How does he detect the sufficient amount of

acidity in the cream to determine when it should be churned? It will be acid enough for churning when it will trickle off the end of a stick, like sirup.....

MR. MONRAD said that half of a litter of pigs were fed on sour, the other half on sweet milk—equal quantities—and the latter were by far the better lot .....

PRES. ADAMS said that farmers and farmers' boys are fast learning they cannot work at farming as their fathers did, and get profitable returns for their toil. They have found they must mix brains with the brawn, or the intelligent ones distance them in the race. It is brains and good wages on the one hand, an uneducated brawn and low wages on the other. This is the inevitable that all must face in farming as in everything else.....

DR. J. B. LEARNED, the pig reformer, says that an over-fed baby feels about as any one does when he is over-full of dinner, and his temper is affected about the same way. He is cross, and doesn't smile. So it's not a Providential act that makes a cross baby. Lay the baby in a clean crib, with no rockers and no rocking. Let him be by himself always. Do not bury him in flannels to keep him from catching cold; this is the way to give him a cold. Let his head be uncovered. A baby fed and cared for in this way requires comparatively little of the mother's time, and none of the grandmother's, or aunty's or the doctor's.....

THE Doctor holds that the average mother's milk is not as good as that from a healthy well-fed cow. Besides, generally, the mother cannot furnish milk without great loss to herself. Give the cow's milk whole with no sugar or water. Give it every three hours whether awake or asleep. The baby will often take it and continue his nap.....

OUR medical journals abound in the best and most approved samples of infants' foods. Our chemists, our professors, and numerous M D s have their names attached, testifying to their purity and fitness. Dr. Learned thinks we can afford to exchange all these for one good cow on the hill-side, in raising babies. .....

IN 1865 Henry Stewart succeeded in feeding 11 cows the whole year on the produce of 14 acres of land by means of a succession of forage crops, grown continuously through the season, and a small plot, not much over two acres, of mangels for winter feeding with the surplus of the summer fodder. A large part of the land produced three crops in the year, and manure enough was made from the 11 cows to go over the whole 14 acres.....

ONE-YEAR-OLD asparagus roots, prepaid by mail 75 cents a hundred. So the seedsmen's catalogues tell us. Can't you afford a little plot? Such a plot will furnish enough asparagus for a family of two. Perhaps you do not care for it. .....

TRY pinching back a hill or so of Lima beans when the plants are a foot or so high .....

JAMES TAPLIN says, in the London Garden, that the notable failure of the past few years among new roses, such as Her Majesty, Princess Beatrice, and, with a majority of growers; Puritan also, has brought about a much more conservative temper on the part of the large rose growers, and in the future, it is highly probable that many of them will test new varieties by the dozen instead of by the hundred.

MR. JOSEPH HARRIS tells, in the American Agriculturist, how he would fit his land for a prize oat crop. He would sow half a ton of Mapes or Bowker potato, or corn manure—it doesn't matter which. Then on separate acres he would sow all the way from 200 to 500 pounds of nitrate of soda or sulphate of ammonia. The R. N.-Y. would not use over 200 pounds to the acre of ammonia or nitrate in addition to the 1,000 pounds of "complete" fertilizer. If we applied the larger amount, unless the season proved dry, we would expect the oats to lodge before the grain formed....

HOWEVER intricate and irregular in shape a lawn may be, says J. C. Olmsted, in Garden and Forest, it should, as a general rule, have a predominating, central, unbroken area, in order to give its characteristic qualities of breadth and repose. The element of openness is essential. It is not uncommon to leave many existing trees scattered over a lawn, or a single tree in the midst of it, or to plant trees promiscuously over it. This is usually done either from a love of trees as beautiful objects, or from the dread of a bare, unfurnished look. No greater mistake could be made .....

A LAWN is at its best when there is no evidence of the handiwork of man—no formality in the grading, none in the planting, no exotic plants, no fountain-jet or basin, no vase or statue, no nicely trimmed path, no fence or formal terrace. Such a lawn conveys the purest impression and gives the most lasting satisfaction. One who cultivates a taste for formality and things evidencing the skillfulness of man is apt to tire of any one object or composition of that kind. It is true that there is a certain kind of refreshment to be obtained from variety in such things, but it is a stimulating, nerve-consuming kind of refreshment, the opposite of that which is encouraged by repose. But to one who cultivates a taste for the beautiful and picturesque in Nature, a single, purely natural scene is never tiresome if seen again and again. The infinite variety in the details and in their disposition, the difference of aspect caused by changes of weather, and by the seasons, by the growth of plants, by birds and other animal life—all are harmonious with the natural scene, are not conspicuous enough to injure any artistic impression which the scene may give, and yet make the scene endlessly interesting .....

IT is not an uncommon thing, continues Mr. Olmsted, to see a formal bed of scarlet geraniums in the midst of a lawn that would otherwise have had much suggestion of a natural breadth and repose. The bed of flowers may be a good thing in itself. It is bright and gay, enlivening and stimulating, and it is well set off by the surrounding turf, but the lawn is sacrificed to it—that which has a permanent worth is made to give way to that which has but a passing value, a source of endless satisfaction to a pretty toy of which every one soon tires. Again, consider the case of a lawn "decorated" with statuary. A beautiful nymph splashing in a fountain, were it not a very hackneyed idea, and where it is the work of a true artist, would be a most enjoyable and valuable possession; but a poor, cheap, painted, cast-iron imitation of such a piece of sculpture, placed so as to dominate a fine lawn, is a barbarism which it is hardly conceivable that any intelligent person could be guilty of. The same thing might be said of almost all the usual so-called "decorations" of lawns. To decorate the face of a beautiful woman with painted ornaments would not be one whit more savage. Our civilization is spotted all over with the relics of barbarism; good taste is always striving to get rid of them, and they should be particularly avoided when we set about making a natural lawn .....

How is your hot bed progressing? Have you a cold-frame? They don't cost much and will greatly assist you in forwarding cabbage, tomato, celery plants, etc., not to speak of flowers. Have you a wheel hoe? It is an invaluable implement in any small garden that cannot be cultivated by horse power.....

THE only objection Mr. Joseph Harris makes to sugar beets is that they will not keep as well late in the spring or early summer months as yellow mangel-wurzels, etc. The latter he grows principally for the ewes and lambs and he likes to have some for the lambs till June or July. Sugar beets are ripe and in good condition to feed earlier than mangel-wurzels. For feeding early in the winter he prefers sugar beets to mangel-wurzels, and if kept in pits or in a cold cellar they can be kept in fine condition till the middle of May. Weight for weight, sugar beets are more nutritious than mangel-wurzels. On the whole, however, he has not yet the necessary facts to determine which is the most profitable kind to grow. We are safe in saying that no farmer, and especially no sheep, cattle or pig breeder, will regret raising a good crop of *both of them*. If he wants to commence feeding early in the winter, he should raise the greater proportion of sugar beets. If he does not wish to commence feeding roots till near spring, he should raise more mangel-wurzels. No breeder ever has too many of either... .....

NEW strains of asters, phlox, verbenas, pansies, zinnias and sweet peas are the most conspicuously announced common flowers in the catalogues of 1889.....

THE color of the new American rose Souvenir de Wootton, is said to be nearly that of the Jacq. with an exquisite odor. It is a perpetual bloomer. It is a vigorous grower. The flowers are sometimes six inches in diameter. Pity that any American rose of value should carry a French name.....

DIRECT.

——WEEKLY PRESS: "We think that red clover does better for being sown with Alsike."

——HOARD'S DAIRYMAN: "Look at the men who are really making the most money in keeping cows. How is it with them? Are they dull and indifferent about keeping posted in their business? Not much. You will find that they value knowledge and they are as willing to pay for it to feed their minds as to pay for bran to feed their cows. Starved cows are generally owned by men who have starved heads. They may be well posted on politics, but they certainly are not well posted dairymen. You will find that with all their experience they have not learned how to breed a profitable dairy cow. They have not learned how to feed a good cow up to the point of profit. They know scarcely anything about the latest and most profitable ways of sheltering, handling and caring for a dairy cow. They have learned but little concerning the latest and most profitable ways of handling the milk, making the butter and selling the product."

——N. Y. HERALD: "A correspondent of the New England Farmer suggests a freight express throughout the New England States that will enable farmers to ship small quantities of produce and truck at low rates to consuming centers. The project, if adopted by the railroad companies, will undoubtedly prove beneficial to both parties—to the farmer by increased facilities for disposing of his product, and to the transporting companies by the increase in their traffic. It is needed by the one and should be granted by the other."

——J H. HALE: "About 1,000 plants equally divided between five best varieties, two early-ripening, one medium, and two late-ripening varieties, will make a grand family fruit patch that will supply a very hungry family of six or eight persons, and during the hight of the season furnish a surplus for canning, and to give to the family of the busy neighbor who 'has no time to fuss with little things.' A fine family fruit garden that would cost on most farms from $15 to $20 a year in manure, labor and plants, would furnish plenty of fruit, fresh and canned, the whole year round, that would be worth at low prices not less than $100. Surely here is a 'home market' worth considering."

——HARTFORD COURANT: "Strawberries should yield 4,000 quarts per acre, raspberries 3,000, blackberries a little more than raspberries, and currants should yield 1,500 to 2,000 quarts per acre."

——"How is it that I dislike the things I dislike so much more than I like the things I like?"

——TERRE HAUTE EXPRESS: "Disgusted Husband—'Is there no way to stop you from kissing that nasty little pug dog?'

Wife—'You might teach him to chew tobacco.'"

——AMERICAN GARDEN: "Some one asked an old florist a question about plants. He frankly answered: 'I don't know,' and added, 'The most experienced of us always find something to learn.' It is impossible for a woman to have 'nerves' or 'tantrums' if she turns her attention seriously to plants."

For Malaria

Use Horsford's Acid Phosphate.

Dr. E. G. DAVIES, De Smet, Dak., says: "I have used it in slow convalescence and prevention from malarial diseases, where the drinking water was bad. I believe it to be beneficial in preventing summer complaints; also one of the best agents we have to rectify the bad effects of the drinking water upon the kidneys and bowels —*Adv.*

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

$20 FENCE MACHINE FOR $10

Freight paid. *Guaranteed.* Hundreds in use. Circulars free. S. M. Garrett, Mansfield, O.

"SWEET HOME."

"THERE is no place like home" runs the old song, and we know how true it is.

Go where we will—encounter men in whatever circumstances we may—we shall be apt to find a reference to their homes will immediately secure their attention, and will give you favor in their eyes.

The impressions made in the home are lasting. A mother's words never pass from the mind. A father's counsel remains fresh so long as life lasts. The last benediction of parental love and solicitude—with what tenacity it clings to the memory when almost all else has gone.

How important therefore, that the home be maintained intact as long as possible—a haven of loving counsel of peace and joy to the growing children. How sad when death invades, when the fire goes out on the hearthstone and the family is scattered. What the children lose by death of a parent only those realize who have grown up without that love and advice which a parent alone can bestow.

No doubt, tens of thousands of parents have found premature graves, who might have lived years of usefulness, had they but known what was sapping their strength, and slowly but surely pushing them into the grave.

There are tens of thousands of parents today in agony of mind through fear of death from kidney disease, who do not know they are doctoring only symptoms—such as wakefulness, nervousness, a splendid feeling one day and an all-gone one another, dropsy, weak heart action, pneumonia, neuralgia, fickle appetite, etc., while the real trouble is poisoned blood caused by diseased kidneys. Unless purified with Warner's Safe Cure they will just as surely die, as though poisoned with arsenic.

If you are suffering as described, and have been for a length of time, you are, unless you get relief right speedily, stricken with death, whether you know it or not.

Doctors publicly admit that they cannot cure advanced kidney disease; they are too bigoted to use Warner's Safe Cure because it is an advertised remedy; consequently, unless you use your own good judgment, secure and use Warner's Safe Cure, a specific, which has proved itself in tens of thousands of cases to be all it is represented, your home, through your death, will be broken up and your loved ones deprived of that which money cannot purchase or friends supply.

Already too many loving parents, noble, kind and true, have gone down to premature graves through ignorance of their condition, and the bigotry of physicians. It is time to cry halt, and we beg of you, for the love you bear your home and the duty you owe yourself, to give this matter your careful and conscientious consideration.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, MARCH 23, 1889.

A SWINDLE.

MR. Alfred Rose, of Penn Yan, N. Y., is said to be over 70 years of age. He is reputed as having been a successful potato grower for 30 years or more. For reasons best known to himself, he began early in the year to circulate among the chief seedsmen of the country and others a report that the R. N.-Y. potato No. 2 was in reality one of his seedlings. With adroitly-worded sentences and a shrewd avoidance of laying himself amenable to the law, although not stating it positively, the person or parties addressed were led by his cunning statements to *infer* that they were.

Mr. Rose was well known to the R. N.-Y. and to several other journals as one who often sought to advertise his potatoes by sending for publication articles which in one part or another would rarely fail to mention in high words of praise one or more of the kinds he sought at the time to sell or to popularize. For this reason the more conservative and careful editors of the farm press were wont to reject his communications without even reading them.

When Mr. Rose first made the claim that the R. N.-Y. No. 2. was the same as one of his productions, we wrote him in an emphatic though kindly way that he was mistaken. We pointed out how he could easily ascertain they were different; that it was absurd to say they were the same from any real or fancied resemblance of his potato to the R. N.-Y. *illustration*, (necessarily his only basis for the claim) and finally that he must write to those whom he had misled and frankly confess his error. This he failed to do for a considerable time, while, in the interim, many letters were written by him to seedsmen and others, some of which were forwarded to us, stating that a number of his patrons believed them to be the same and that the Editor of the R. N.-Y. himself had said, "There is no doubt about it."

It now became apparent that Mr. Rose was simply advertising his potato upon the reputation of the No. 2. A demand in consequence appeared on this page several weeks ago that unless he wrote us for publication a statement acknowledging his error, we should expose his groundless pretensions. This called forth from him a letter dated February 25, from which we quote as follows:

"I wrote you, by your request to-day, that the R. N.-Y. No. 2 and my ——— were *not* alike."

This would have ended the matter in so far as the R. N.-Y. was concerned. But later we received from several sources a printed potato-circular, issued by him, from which the following extracts are taken:

"RURAL NO. 2.—This potato, Carman says, was grown on the Rural Grounds in 1886, but does not say from what variety. Spring of 1886 I sent Carman some of my ——— and my customers write me No. 2 is precisely like my ———; also they write Carman that their potatoes are precisely like No. 2."

Again Mr. Rose says: "It is no wonder, some writing me (*sic*) that they have received a potato under a new name, saying it is precisely like my ———. I notice Mr. Carman says he has a new potato, and says since they have been sent out, he has received many letters saying their own (*sic*) potatoes were precisely like his. Carman says there is no doubt about it. If so, where did he get the new potato?"

It is needless for the R. N.-Y. to say that every statement in Mr. Rose's circular alluding to Mr. Carman or to what he said, is false and without the slightest foundation in fact. We regret exceedingly to be obliged to dwell upon this matter at such length in these columns. But we think that our readers will see that though it may matter little that Tom, Dick or Harry may seek to give prominence to his own potato by striving to show a probable identity with one that has a promising future, it is of the *first* consequence to the R. N.-Y. that an inferior variety should not be disseminated as the Rural New-Yorker No. 2. Mr. Rose advertises in his circular that he will supply the R. N.-Y. No. 2, at a price considerably less than that which other seedsmen charge—at a lower price, indeed, than he can purchase them for to-day. His entire stock of this variety was *one peck*, and the reasonable inference is that he will send instead of the No. 2, some variety which originated with him of which he may have a full supply. All who may have ordered of him the No. 2, and who find that another variety has been substituted, are notified that they will have a legal cause of action against him for damages.

THE RURAL NEW-YORKER for 1889, will be, as hitherto, invariably, $2.00 a year for single subscriptions, and $1.50 in clubs of five or more.

THE notes on "Warranted Seeds" in this week's R. N.-Y. are timely and interesting. We are sure that the best of our seedsmen desire to do a fair and honorable business. Mistakes will occur in every business, no matter how careful one may be. It is right that such mistakes should be rectified by the party making them.

We have just been reading an account of a curious lawsuit that occurred in England recently. A seedsman was accused of dyeing clover seeds. His practice was to buy quantities of old and worthless clover seed and subject it to a chemical process by means of which the color of the seed was changed so that it resembled bright, new seed. A very profitable business was being done by means of this fraud, and the reputable seedsmen determined to break it up. Accordingly, several sacks of old seed were sent to the "chemist to be colored." This was done, and the most complete evidence obtained against the guilty party, who was found guilty and heavily fined. The only defense made was the statement that the responsible head of the firm did not know what his employes were doing. This did not hold. We do not know that there are any seedsmen in this country who are invoking the aid of chemistry to defraud their customers, but there are plenty of other schemes that would not stand a lawsuit. We believe that the most economical way to try seeds is to deal only with seedsmen of known and well-established reputations for honesty.

THE RURAL NEW-YORKER'S NEXT POTATO CONTEST.

IT is proposed that the potatoes of the next "Contest" plot be dug on the last Friday of September next. The plot will be more than twice the size of last year's plot, and the effort will be, as then, to raise at the rate of over 700 bushels to the acre. The following gentlemen have consented to act as judges:

LIEUT. GOV. EDWARD F. JONES, N. Y.

PROF. GEO. H. COOK, Director of the N. J. Agricultural Experiment Station.

L. H. BAILEY, Professor of Horticulture at Cornell University.

Dr. BYRON D. HALSTEAD, Professor of Botany, at Rutger's College, N. J.

E. H. LIBBY, Editor of the American Garden, N. Y.

E. L COY, N. Y.

HON. JOHN A. WOODWARD, Pa.

J. S. WOODWARD, Secretary of the New York State Board of Agriculture.

PROF. HENRY E. ALVORD, Director of the Maryland Agricultural Experiment Station.

COL. F. D. CURTIS, New York.

HON. J. G. WEBB, Justice of the Peace, N. J.

BEET-ROOT SUGAR IN NEBRASKA.

A GOOD deal of interest is shown by the farmers of Nebraska in the establishment of an immense beet-sugar factory, at Grand Isle. It will represent an outlay of $500,000, and have at the outset a capacity for using up 350 tons of beets per day, and by means of additional machinery the quantity may be increased to 600 tons. The company has been experimenting for two years and is satisfied from its investigations, that, as far as soil and climate are concerned, Nebraska is better suited for the growth of sugar beets than any sugar-producing region in Europe. Samples of the experimental sugar have been sent abroad, where strong testimonials were received of its superior quality. So firm is the faith of many of the farmers about Grand Isle in the enterprise, that they are ready to exchange their farms for stock in the company. It is estimated that well-cultivated land will yield 15 to 20 tons of beets per acre, and that they can be sold at the mill for $5 per ton. If the project proves successful other factories will be established. A bill is now pending in the legislature, which proposes that, at the end of two years, the State shall give a bounty of half a cent per pound on all sugar manufactured within her borders. If Congress gives the proposed national bounty of one cent per pound on all cane, sorghum and beet-sugar of domestic manufacture, there is little doubt that the amount of home-produced sugar will be immensely increased, and of these three sources of sugar, the increase in the beet-root product is likely to be the greatest.

THE BINDING TWINE TRUST.

ALL over the West there is a good deal of indignation among farmers at the action of the manufacturers and large dealers of binding twine. These have formed a Trust which is slowly but surely tightening its coils on the farmers of the country, but especially on those of the West where self-binding reaping machines are most extensively used. Not only has the whole prospective output of binding twine been bought up by the agents of the Trust, but nearly all the stock on hand at different points has been secured at low figures by agents of the monopoly disguised as farmers, store-keepers, etc., so that the vast majority of dealers are in the same plight as the farmers. In Minneapolis alone 50,000 bales of twine are reported to be packed away in warehouses, the local dealers having been induced to part with their stock to disguised agents of the syndicate. An agent of the Minnesota Farmers' Alliance who was sent East to the factories to contract for a supply, has been unable to do so, as an extortionate price was demanded. For twine which could be bought last year for nine cents per pound, 25 cents are demanded this year.

What can the farmers do in the matter? Well, they can secure legislation against such infamous combinations in the future; but for the present, the only plan they can adopt is that which many of them have resolved to follow—to boycott the Trust, and as the cotton-planters of the South acted last year with regard to "cornered" jute bagging, refuse to buy binding twine. Twine, however, has become, in a few years, almost a necessity in easily, cheaply and safely harvesting grain, and it is hardly probable therefore that a boycotting movement can be general, while much loss and inconvenience must be experienced by those who adopt it. Binding twine is made of sisal or jute, and the import duty on foreign twine made of either fiber is 35 per cent. There are many who believe that the most effective way to combat Trusts is to remove the duty from foreign goods that compete with the "cornered" products of domestic manufacture. The number of farmers holding this opinion is likely to be largely increased by the exactions of the binding twine Trust. Would it not be advisable for the Farmers' Alliance, the Grange and other agricultural associations to combine and seek relief in foreign markets? The Trust has put up the price of twine 177 per cent.; surely importers of foreign twine, even after paying the duty of 35 per cent., could afford to sell the article at a lower figure than that demanded by this greedy and unscrupulous monopoly.

The farmers of Dakota contemplate the construction of a large factory for the manufacture of twine from flax fiber, of which there is an abundance. Some of the large dealers in Chicago deny the establishment of a Trust, and allege that the enormous rise in price is due to the scarcity of supply and the great demand for the article. The amount of hemp in sight for the present season is 120,000 bales more than last year, while there is a demand for 160,000 bales more, making a shortage ef 40,000 bales; but surely the tremendous increase of price cannot be due to this small shortage? If so, a little boycotting or even economy on the part of farmers will equalize supply and demand.

BEEF MAKING EXPERIMENTS.

THE pictures of cattle given in this number of the RURAL ought to interest cattle feeders. There are many interesting things about Prof. Johnson's experiment. We want cheap beef and we want good beef. In the estimate of expenses of the R. N.-Y. household, a certain sum is assigned for the purchase of beef. Our experience is that it pays to buy with this money a less quantity of good beef rather than a larger quantity of poor beef. There is altogether too much tough, stringy, leathery beef sold in our markets. Experiments that tend to show the principles that must be followed in the production of good beef are highly commendable. The main facts brought out by the experiment are all given on another page. There are only one or two points that we desire to refer to here. It is evident that a great many cattle are kept too long for profit. If some of the animals pictured on our first page could have been sold six months before they were killed, the cost per pound of their beef would have been considerably reduced. This is a point that cattle feeders generally will agree upon. The amount of hay and other coarse forage required to feed one of these animals to maturity is surprising. It hardly seems possible, as we feed the usual ration from day to day, that the grand total of all these feedings will amount to three or four tons before the steer is ready to kill. These figures teach the desirability and economy of providing some cheap and bulky food like silage, roots or corn fodder.

The facts demanding most thoughtful consideration are those respecting the Jersey and Holstein steers. Everybody knows that the Holstein is a large, heavy animal, but the impression has become quite general that the Holstein steers are too coarse and bony to be of first value. The figures given for this test certainly indicate that this impression is erroneous. The Holstein steer made almost as much gain per day as the Short-horn, his beef cost less per pound, and his per cent. of dressed to live weight, was greater than that of the Devon and the Galloway, and equal to that of the Hereford. The quality of the beef was considered good. The value of Holstein cows for milk is unquestioned. The value of Holstein steers for beef, as indicated by this test, would stamp this breed of cattle as strong candidates for the position of "general-purpose" breed. Will Short-horn cows average as heavy milkers as Holstein cows?

The figures respecting the Jersey steer are also very interesting. The Jersey steer has always been regarded as a sort of "lazy brother." His sister, the butter cow, was expected to be so superior in her chosen field, that she could support herself and her brother too. Has this impression been a sound one? "Roscoe" ate more hay than any of the other steers except the Short-horn, and more grain than any except the Short-horn and the Holstein, and yet he made the poorest gain per day and his beef cost the most per pound. His heart, his lungs and his intestines, were as large as the corresponding parts in the big Short-horn, and he had but little less blood than the big fellow; yet his beef was considered best of all, so much better in fact that there was no comparison. We have no desire to begin the business of raising Jersey steers in the hope of securing an extra price for their beef. It may be that it would pay some of our enterprising Jersey breeders to try it, and develop a business for fine Jersey beef, in connection with their Jersey butter. It might be worth trying, at any rate.

BREVITIES.

THE R. N.-Y.'s dairy department will be good this year.

WE did a little plowing on March 12th in the "contest plot" of one of the R. N.-Y. women folks.

ONE lady in North Carolina says that her "contest" potato plot is already planted. Think of this, ye Northern contestants, whose patch is now under a foot or more of snow!

SOME of our best horsemen and farmers are going to tell us what they think of Mr. Terry's idea of keeping his horses on clover hay. Mr. T. will also tell us how he cures his hay to make it so good.

HERE is the way an Illinois friend puts it:

"*No algebra about this.*—Certain Agricultural Papers—50 cents a year—RURAL NEW-YORKER—$2.00 a year—*Therefore*, you will have to take the other papers four years to learn as much as you can learn in the RURAL in one year."

A MINNESOTA subscriber sends us the following note:

"A rod of barbed wire wound around a tree prevents a person from tying horses to it and also keeps boys from climbing it, and it looks far better than a box around the tree." This is one of the latest schemes for handling the much-feared "small boy."

A BILL prohibiting the sale of liquor "within half a mile of the State Fair Grounds" is before the Minnesota legislature, and is likely to pass. Minnesota is steadily tightening her grip on the liquor traffic, and in no place should that grip be more fatally throttling than about the fair grounds, to which simple country people flock for instruction and amusement, but often find instead demoralization and disgrace. If such a law is right and good as regards the State Fair Grounds, why shouldn't it be equally right and good as regards the county fair grounds?

Indust'l Societies.

THE TWENTY-SECOND SESSION OF THE AMERICAN POMOLOGICAL SOCIETY.

(R. N.-Y. SHORT-HAND REPORT.)

Cross-fertilization; different opinions as to the first year's effects of cross-fertilization—very slight or wholly unnoticeable, as a rule; cost and advantages of bagging grapes; the Japan persimmon; progress of fruit growing in the South; oranges and other Southern fruits; fertilizers for oranges; bird and insect enemies and diseases of the orange; a newly imported orange borer; varieties of oranges.

The essay of D. M. Neal on cross-fertilization was full of suggestions to the progressive fruit-grower. He was flooded with questions, many of which could not be answered. "As a rule," he said, "you get vigor of growth and flavor from the maternal parent." The great point in which all were most deeply interested, was as to the visible effect of crossing, the first year. Many did not believe in any such effect at all. Some knew for a fact that an effect could be noticed, others were on the fence, and open to conviction. Dr. Moore had seen the Navel orange affected at once. Mr. Van Deman had yet to see any effect the first year in any fruit or plant. Ex-Gov. Reed, of Florida, had seen oranges on his Navel trees without the mark and with seeds, and also on the same branch oranges with the mark, but no seeds. Since the advent of the Navel in Mr. Moore's grove, he has found it scattered all through the place. Mr. Van Deman alluded to its deficiency in pollen; in 100 good flowers only three or four stamens had been found. Rev. Dr. Phelps, the orange expert, was undecided as to the direct influence being visible the first year, but he felt sure that nearly all oranges would in a few years, show Navel marks. A Navel with numerous seeds and otherwise like the wild orange, was already among his seedlings. President Berckmans reported strange sports of the pear on a Vicar of Winkfield tree which had been planted among Seckels and Flemish Beauties. A single branch bore specimens of each—one being russet like the Seckel, another an apparent Flemish, a third a true Vicar. The same thing between the peach and nectarine had come under his eye, and he wanted to know the reason of it all; but he got very little light on the subject. Mr. Phelps had, years ago, learned to see how very much he didn't know. Dr. Neal said there was a striking analogy between plants and the human species, and he cited an instance of the marriage of a black man to a white woman, where both in time became mulatto in color.

One cent a pound Mr. Parry thought was the cost of bagging grapes. Mr. Newman got ten cents for bagged grapes, and four for unbagged fruit. He preferred this rot remedy and thought it would pay in a commercial vineyard. The Ives's quality is vastly enhanced by bagging. He sold all such this year for ten cents net, while every uncovered berry rotted.

The Japan persimmon was the subject of the next paper by B. F. Livingston, Florida. No other fruit grows so vigorously in the State, he said, and without fertilizer, at least if grown on native stock. No manure is needed. His grafts began to fruit when five months old. His 600 one-year-old trees were eight feet high. There is no trouble to grow them. Varieties are numerous, there being about 46 distinct sorts known in Japan. But marketing, packing and shipping are yet problems. He advised wrapping the fruits in tissue paper, and that they should be packed at once when fully ripe, in trays one layer in each.

On Thursday morning the reading of the report of the Sub-Tropical Committee was first in order. The document was a very complete and instructive review of the progress of fruit growing in the South, and included special reports from separate States in detail. Many of the fruits named were unknown to many of the Northern delegates, and they listened closely to the descriptions and characteristics of each. The strawberry is the only small fruit grown much in Florida. New plums of the oriental strain are promising. Lemon culture is rapidly increasing. The lime deserves more attention. The shaddock is grown only as a curiosity, being without value for the table. The guava is very popular, and is extensively grown. It cannot bear any frost and is very perishable. Figs are also raised with profit. Olives do well near Fernandina. Dates may be found in a few gardens, and the cocoanut is largely grown near Lake Worth and the Keys. The pineapple is the most important tropical fruit raised in Florida and some of the "pineries" are successful and very profitable. There are several varieties in cultivation.

The minor citrus fruits were then described and reported upon in an excellent essay by the Rev. Dr. Moore. He spoke of the antiquity of the citron. It was the first member of the family brought to Europe and preceded the orange there by a thousand years. Its blossom is superior to the rose in fragrance, and very salutary. It is easily grown and handled, and he thought there was no excuse for the present neglect to grow it. We should export it largely instead of importing it as we now do.

The lime, originating in the West Indies, has never been properly appreciated here. Quanquat—a small oblong yellow fruit—is most delicious and refreshing in flavor and excellent preserved in sugar. Pomologist VanDeman made an earnest protest against the use of the term "Grape-fruit" which was not only incorrect but unreasonable as a name for that friut. The true name being Pomelo, he urged the society to adapt the latter name and avoid further question and confusion.

Then followed one of the most interesting and valuable essays of the session, especially on the subject of sub-tropical fruits to which the extra day was practically devoted in deference to the Florida people. It was by Senator C. F. A. Beilby, of Florida, and was also a scholarly production. He gave a complete history of the great "Orange Industry in Florida," with much valuable data and careful details of culture and general management. The further east you go, he said, the further north you may venture to plant oranges. The possibilities of orange culture here are limitless. Nearly all soils will produce oranges; no one can decide which is best; fertilizers are not absolutely necessary until the trees begin to bear. The notion that oranges cannot be successfully grown on the flat lands is erroneous. The trees should be set high with the crown roots at the surface, without exception. The supply of moisture should determine the method of culture. Too much ammonia is now used as a rule. It makes the fruit coarse and impairs the vitality of the tree. Such an amount would answer only on dry pine lands. Pure raw bone is the thing to use. It is slow but sure, and perfectly safe in all cases. Cotton-seed meal, and potash in the form of sulphate should also be used. The "foot-rot" and "die-back" are the most troublesome diseases in the State. Three-fifths of the latter come from improper fertilizing. The "scale" and the "rust" are not serious as yet. In closing he paid a glowing and beautiful tribute to the orange, to Florida and her wonderful climate. He was roundly applauded by North and South, and was the target for an avalanche of queries for some time afterward. Dr. Neal considered "foot-rot" a fungoid disease. Growers were warned by him of the approach of a borer from Mexico *via* Texas, which, he said, was most dangerous. It bores into the orange much as the codling moth bores into the apple. The Rev. Dr. Phelps said it was already here and it was high time to talk about its extermination. The Woodpecker and Jaybird were also credited with an increasing appetite for oranges, and the wild cat bounty was advised to be transferred to these feathered "insects." The sap-sucker girdling the tree at the base with holes, is another enemy in the orange grove. E. H. Hart followed with a somewhat humorous and ingenious paper on "Varieties of the Orange." The late P. W. Reasoner, of Manatee, had compiled a list of 150 kinds. There is fashion in oranges as there is in ladies' bonnets, he said. Few growers know which is best to plant. For flavor the Maltese Blood and Navel strains were mainly preferred. California growers pride themselves on being able to supply our markets when our Florida crop is gone, but what will they do when with proper care and selection of varieties, we drug the markets all summer? H. H.

(To be Continued.)

Everywhere.

RURAL SPECIAL REPORTS.

New York.

FORESTVILLE, Chautauqua County, March 6.—The sugar season has at last arrived. The indications are right for a good long one, yet it is quite liable to be otherwise. The great want of the maple sugar producers in this part of the country is knowledge of the markets *i. e.*, where to send the sweet. There are plenty of good markets all over the land, but the average farmer has no time to spend in looking up these places. The only way to solve this question practically, would be for the producers in each county or locality to organize themselves into an association, electing one of their number as head officer, whose business it should be to obtain the best markets possible for the use of the association—said officer to be paid for his time and trouble by an assessment upon all of the members. The outlook for the coming season is comparatively good, there having been a little more activity in the money market for the past six months. This has had a tendency to brighten the hopes of all in regard to the near future. At least it will be safe to say that this will be no worse than the last season for the farmer in general. It is always best to look on the bright side when we can. C. H. F.

Pennsylvania.

SAEGERSTOWN, Crawford County, March 5.—We have had an unusally good season for crops in this section. Hardly in years have our crops been more generally good than they were last season. Hay was an average crop, and put up in good order. Winter wheat was good. Corn and potatoes were never better. I raised on six acres 954 bushels of ears of as good sound corn as I ever saw—level culture. Potatoes were a good crop; but there is no sale for them at any price. I raise the Rural Blush sent out by the RURAL. It is the best potato so far as yield is concerned I have ever had. Oats were a good crop—very heavy. Apples were a fair crop. We have had a very mild winter. Ice-men began to think that they would "get left;" but they have got some at last. Feed is plentiful and stock low. I have been a subscriber to the RURAL for 21 years. Success to it! D. A. K.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

"CLEANLINESS is next to godliness." But a woman who considers her surroundings clean, merely because she scrubs around and sweeps and dusts, may ignore some essential rules of health, in spite of her housewifery. We have gone into many houses, clean enough otherwise, where the entire place was haunted by the ghosts of dead and gone dinners. There were the aggressive odors of the cabbage they had yesterday, of the fried steak of that day's breakfast, of smoked bacon from a previous meal, and an under-current of vegetable odors remaining from weeks past. The air in the rooms seemed dead, and somehow the entire family gave the impression of sleeping in their clothes. Maybe they were clean. The children wore clean pinafores, and the mother a neat gown, but it was evident enough that ventilation was a thing unknown. Now, from experience of poorly-heated country houses, we know that it often seems quite an infliction to throw open the windows in the bitter winter weather: the ventilation seems enough to chill everything in the house. But it is a certain fact that you cannot warm foul air, and make it fit for breathing. Certainly, there is danger from drafts, but it is a good deal better to go about one's work wearing a shawl, while the rooms are well aired, than to continue absorbing into the sensitive lungs noxious gases charged with all sorts of impurities. There is always a stuffy odor about these unaired houses, and the dwellers therein always seem to carry this atmosphere with them. Pure air and clean water—plenty of both—then there is no trouble about stuffiness or staleness.

* * *

SAYS one of our correspondents: "I want to add a word of approval, or appreciation, of 'J. H. G.'s' sentiments expressed in the article Smoking in Public Places, on page 94. It is a very lamentable fact that so many men are lost to reason, right, and regard for others' feelings, that they allow this one ruinous habit to so blind them to justice that they will with their impudent impunity, force innocent people, aye, in many cases, hapless babes, to breathe air so loaded with filthy and disgusting tobacco smoke that it becomes almost unbearable. When will all men aspire to be GENTLEMEN? I hope 'J. H. G.' may—as Gail Hamilton once said—have frequent 'spasms of sense' on this same subject. It is so closely allied with that great question, or issue, which now interests every good Pennsylvanian—*Prohibition*."

* * *

WHILE we are, in popular phrase, "pitching into" the men for their tobacco, we want to add a few deep-felt remarks on the girl who chews gum. Everywhere we go now, on the street-cars, the ferry-boat, in the concert-hall, and even the church, we meet the girl who chews gum. We won't say anything about the hygienic side of the matter; but simply regard it as a matter of looks. Can you imagine anything uglier than the constant contortions of the face, caused by the mastication, especially when in a jolty car. The jaws seem tireless. And the worst of the matter is that gum chewers never seem to know how to masticate properly. They open and shut their mouths, twist their tongues, and make every ungainly face it seems possible. Perhaps if they only knew how ugly they look, they *might* give up the habit. The fact that it is vulgar, annoying to others, and plain evidence of ill-breeding, does not affect them in the least.

* * *

A VALUED correspondent offers a suggestion for another Women's Special, viz: "The Health of Children: How best Secured; Its relation to present modes of eating, drinking, studying, playing, working, resting, bathing, etc."—a very important subject, too. In spite of objections to the rigorous training of our grandmothers' days, the children of that age seemed to make more vigorous men and women than the present generation. Singularly enough, in spite of their disadvantages in dress and the like, the girls in small towns and villages are apt to be finer physically than the boys in corresponding circumstances. So many of the young men we know among people in easy circumstances are narrow-chested or are under-sized, while their sisters are comparatively robust. But then it is fashionable nowadays to be rosy and muscular.

* * *

THE French fashion of wearing artificial flowers on winter hats and bonnets seems on the increase; they certainly brighten up the headgear wonderfully. Violets are first favorite, especially on a black hat, and they make a charming finish for a velvet toque. A pretty hat was a turban of sage-green cloth, the covering being laid in folds along the sides, while it formed a high shirring in front. Down the center of the crown was a very natural spray of dog-roses and foliage, and a bunch of the same blossoms was in front. It was very pretty, though dog-roses do seem a little summery for February. A very dainty capote bonnet was completely covered with single violets put on flat; at the top were rosettes of black lace, with a bunch of violets in the middle. A bonnet having a puffed tulle crown, and a brim covered with violets, can be readily made by a handy girl; it will cost but little, and is very dressy.

ONE THING AT A TIME.

OLIVE E. DANA.

DON'T train yourself to do two or three things at once, my dear Mrs. Busy Hands, especially if one of them is unnecessary. Yes, I know that it is very enterprising of you; it seems so much time gained if you do the spring cleaning and alter the children's spring clothing within the same fortnight, and maybe tack a comforter or two beside Or, again, does it take away the sense of drudgery and satisfy your intellectual aspirations to read Tennyson or Macaulay while you darn the stockings? Or have you found that you can take the Chautauqua Course by having a book always at hand—propped above the kitchen-sink, open by your work-table, pinioned near the bread board, or, maybe, under your pillow?

But you would better not do these things in this way. If you cannot do them one at a time, it would be better to leave them undone, most likely.

"Whatsoever thy hand findeth to do, do it with thy might." The old rule of "the next thing" is the best, wisest, most Christian. One thing at a time, and toil is sweeter, sleep sounder, life nobler. Most of us cannot use two or three faculties at once without undue drafts upon our strength and vitality. Don't imagine you must plan out that article, if you are a writer, while you do the morning dishes; or arrange the details of the day's work even, dear, busy mother, while you eat your breakfast. Wait for the real opportunity and season for the article. Sit down a bit between tasks and take life easy, especially if you are tempted to hurry. You will find the day's work unfolding as you go on, and your strength will last better.

It is hurry and worry that wear and strain and kill. There will, very likely, come a time when you will be supremely thankful to be able just to go out to that kitchen-sink and wash those dishes, a work that now seems so distasteful a task, and when you would esteem it bliss to "be half a day doing the chores."

Just "bide a wee and dinna fret."

OUTINGS IN NEW ENGLAND.

II.

MARY WAGER-FISHER.

HOWEVER objectionable the east winds of Boston may be in winter, they are very fresh and agreeable in summer, and render the city a most tolerable place for the summer saunterer. Boston always seems to me to be just the right size for a city, and with a nucleus or center to which all Boston brains gravitate. In years gone by the book store of Fields, Osgood & Co , was a general resort for literary-minded folk, and now their successors in the business continue to maintain the old-time attractions. There is nothing new fangled or fine about the place; but it is home-like and hospitable to a famous degree. One finds there all the new things turned out by the printing press, and there is no charge for information, or for looking at things. Dr. Oliver Wendell Holmes, when in Boston, can be seen there almost every day, a spry little man nearly 80 years old, just five feet three inches tall, and his portraits look very like him. He is a wonderful man in physical and mental activity, and his four-score years have not aged his heart—the right way to live, *not* to grow old! The loss of his wife a few years ago was a heavy blow, for she had been of the greatest value to him, taking such complete charge of all household and sublunary affairs, that his mind was left entirely free for intellectual work Most of the literary men of this country have been fortunate in their matrimonial partnerships, and it would seem that men more than women, depend upon smooth surroundings for the development of their genius. There is probably not a man alive (or dead!) that would write anything of the value of "Uncle Tom's Cabin," under the conditions in which the author of that famous story wrote, and it is probably true, that when any soul is charged with a message for the world, he will manage to deliver it in spite of unfavorable environment. I think Boston people feel that there will never again, after the passing away of the coterie of poets of which Emerson and Longfellow were two, and of which Lowell, Whittier, and Holmes are still shining members, be so much of the heavenly fire burning at the same time in New England. From the newer life of the West and South will undoubtedly arise the men and women who in the next century will add most to our national glory in the way of science, literature and art.

Naturally, in a locality so abounding in historical interest, one turns to things of the past, to Faneuil Hall, with its sanded floor, its walls now hung round with portraits of the worthies who fanned into a flame the revolutionary sparks, and were at the time denounced as mischief-makers and brewers of trouble. But where and what indeed would we now be if the revolution had not been brought about and the country cut loose from England? One of the portraits is a large picture of Webster making the speech in the United States Senate in which he cried "Liberty and Union now and forever," etc. Just above this hangs the portrait of another worthy with a puckered face and hair at each side of his head like a bunch of sponge or coral. There's far more interest in the Old State House, because the Boston Society has lodged therein its own precious relics: a cannon fired by Lafayette, a drum beat at the Battle of Bunker Hill, a looking-glass brought over in the Mayflower and which belonged to John Alden, and cases of china, pitchers, punch bowls of colonial times, photographs, portraits, maps, etc., in great numbers. One of the attendants was kind enough to bring from a private room John Alden's looking-glass for us to see, and it was with a strange feeling that I looked in it, half expecting to see John's or Priscilla's face reflected, instead of my own—a good glass set in a gilt frame, with a strip of wood across it to cover the union of two pieces of glass as usually seen in old mirrors. Judging from some of the furniture brought over by the forefathers there must have been quite a number among them who were well-to-do, and could afford luxurious surroundings. But the thing that most impressed me in this collecton was the last photograph taken of Abraham Lincoln, March 6, 1865, a face fuller of trial and of burden-bearing than the pictured face of any other being, human or divine, that I have ever seen.

The little old cemeteries in the midst of the city are stuffed with graves marked by small headstones, mostly of gray slate—one stone often serving for several graves. In the Granary burying-ground which is just around the corner from the church where "Adirondack" Murray used to preach, are the graves of Paul Revere, Peter Fanueil and the parents of Benjamin Franklin. Anaximander took the "laddie" one day to see the window in the old Church where Paul Revere hung his lantern. There is no inscription on his headstone but "Here lyes the body of Paul Revere," with the date of his death and his age. The stone Benjamin Franklin put up to mark the graves of his parents, fell into decay, and so a number of Bostonians erected a monument of more lasting character and had cut in a bronze tablet, the inscription on the original stone, which runs thus:

"Josiah Franklin and Abiah his Wife.
Lie here interred.

They lived lovingly together in wedlock fifty years, and without estate or any gainful employment, by constant labor and honest industry, maintained a large family comfortably and brought up thirteen children and seven grandchildren respectably. From this instance, reader, be encouraged to diligence in thy calling and distrust not Providence. He was a pious and prudent man. She was a discreet and virtuous woman. Their youngest son in filial regard to their memory places this stone. J. F. born 1655 died 1744 Æ. 89. A. F. born 1677, died 1752 Æ. 85."

Most of the stones bear on the top a death's head, cross-bones, or the death's head blossomed into a suggestion of a winged angel. Many inscriptions are obliterated and some of the graves are sunk into oblivion. But the people who sank into them had their day and must have foreseen something of the splendor of the nation they were founding. It was all in all a very good time in which to live.

A GREAT CONVENIENCE.

E. S. LINCOLN.

A HINDERANCE greater even than tan, sunburn and freckles, to daily work in field and garden, is the inconvenience of our dress. White underclothing is so soiled as to be destroyed in cleansing; dress skirts are "draggled" in the dew of a sweet, cool summer morn; shoes soaked out of shape, grass stains and mud stains incurred, outweigh the actual benefit of fresh air and exercise. Many ladies avoid this difficulty by wearing a 'work suit," made of thin brown denims or heavy ginghams. No white underclothing at all is worn with this. The suit consists of waist and drawers conbined; the waist is made with yoke and loose belt, high in the neck, and long-sleeved. A short, full skirt, reaching from two to six inches below the knee, is buttoned to the waist at the belt, which should fit very loosely.

If you wish to experience the very "poetry of motion" while doing really hard work, go a step further, and cut your sleeves and the shoulders of your work-suit waist in "Raglan" or some such style as will give perfect freedom to the arms and shoulders. The peasant woman of Switzerland who sings at her task, is dressed for her work in short skirts and easy-fitting bodice waist that leaves the shoulders as free as a man's vest. The linen undervest worn with this is made with the old-fashioned "gusset" at the armhole, so there is no confinement of the arms.

Until last year I defied "tan" by wearing a deep sun-bonnet, and frequent bathing of the face in cold, soft water caused free perspiration in the heat of that cavernous bonnet, and kept me "blanched" to the proper degree—whiter than I could have been staying indoors. With such a work suit as above described, I always wear linen collars or lace ruches, and it is a wonderful lightener of work in house-cleaning times, or wash days, and is nice to wear if you go nutting, fishing, berrying, botanizing, or geologizing.

GOLDEN GRAINS.

JULIA WARD HOWE thinks that the greatest defects of American girls are the neglect, first, of religious instruction; second, of hygienic discipline; lastly, of what Socrates calls "the temper of a guardian," by which she understands a habit of combining forethought with presence of mind, strictness with sympathy, the power to assume responsibilities with the power to bear up under them.

THE CHRISTIAN UNION says that the world breaks the hearts of its best benefactors, and then, after many days, builds them sepulchers. If you would raise the age in which you live, you must live above it, and to live above it is to be misunderstood, perhaps persecuted....

DO RIGHT, says Robertson, and God's recompense to you will be the power of doing more right. Give, and God's reward to you will be the spirit of giving more. Love, and God will pay you with the capacity of more love, for love is heaven and the spirit of God within you.....

FISKE reminds us that every temptation that is resisted, every noble aspiration that is encouraged, every sinful thought that is repressed, every bitter word that is withheld, adds its little tem to the impetus of that great movement which is bearing humanity onward toward a richer life and higher character .....

THE most real hell and deepest hell is selfishness. This is the great gulf fixed between the evil and the good, which cannot be passed over.....

KINGSLEY'S advice is never to hurt any one's self-respect. Never trample on any soul, though it may be lying in the veriest mire; for that last spark of self-respect is its only chance, the last seed of a new and better life; the voice of God which still whispers to it, "You are not what you ought to be, and you are not what you can be; you are still God's child, still an immortal soul. You may be a man yet, after the likeness of Christ who died for you." Oh, why crush that voice in any heart? If you do, the poor creature is lost, and never tries to rise again .....

HOME MAKER advises us not to say a rough word when a smooth one will serve our purpose as well. Before indulging in retort, or sly thrust, or "crusher"—whatever the provocation let each of us ask him or herself: "Would I wish this unsaid if I were never to behold his living face again?" Common sense ought to have proved to us by this time that oil is a better lubricant of household machinery than vinegar or caustic.....

WHEN we are coldly discussing a man's career, says Geo Eliot, sneering in our self-righteous, self-opinionated way, at his mistakes, blaming his rashness, and libeling his opinions, words, and actions—yes, his thoughts, that man, in his solitude, is perhaps shedding hot tears because his sacrifice is a hard one, because strength and patience are failing him to speak the difficult word, and do the difficult deed.....

THE following stories are vouched for by a good blue-stocking Presbyterian minister of Pennsylvania:

SUNDAY SCHOOL TEACHER:—"Who was Esau?"

SMALL BOY:—"Esau was a man who wrote a book of fables, and sold his copyright for a bottle of potash." During the Christmas review exercises, at a mission school for track hands, in Pennsylvania, the question was asked, "Where was Christ born?" A boy, raising his hand, said "In Mauch Chunk." The horrified superintendent answered; "Oh, no, Christ was born in Bethlehem." "Well I knew it was somewheres on the Reading Railroad." He referred to the little town of Bethlehem, Pa., on that road.....

THE BEST COW in June gives milk of a rich orange tint. From this milk butter is made as nearly perfect in color as the buyer could wish. With Thatcher's Orange Butter Color this tint can be maintained the entire season. —*Adv.*

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

EXTRACTS FROM SUNDAY EVENING TALKS AT THE RURAL GROUNDS.

FOR the enlightenment of our new subscribers, we again state that the extracts under this heading are taken from essays or talks read or given extemporaneously at what we call our "Sunday Evening Devotional Exercises" by the different members of the RURAL circle, who, as our old readers know, live in a lonely country place and some distance from a church. These exercises consist of Bible reading, discussion of the matter read, reading and explanation of the International Sunday-school Lesson, reading of the paper prepared by one of the members, and singing, ending with repeating in concert the Lord's Prayer.

Our readers will kindly consider that our extracts are taken alike from young and old. While we intend to quote from time to time from these talks, many of them are of too personal a character to allow of so doing As a matter of course, the RURAL NEW-YORKER does not hold itself responsible for the principles advocated or denounced in these talks.

"And if a house be divided against itself that house cannot stand." St. Mark 3-25.

(*Spoken without notes by a woman of* 37.)

"Did you get the evening paper?"
"No, I forgot it" was the answer.

"Ah! you forgot it, I suppose, because you knew that I particularly wanted to see it," came the cutting retort. For some reason, probably the injustice of the words, this bit of dialogue with my father and mother as speakers is remembered with the vividness of yesterday, though nearly 20 years have passed since the words were spoken. It cannot be possible that parents can realize the everlasting effect that their own uncongenialities and inharmonies have upon their children, else for humanity's sake, they would agree to disagree peaceably without the daily encounters that render life a burden and home a charmless place.

With a girlhood the happiest times of which were passed away from home, was it a wonder that I hailed with delight the prospect of a home of my own, to be shared with a companion to whom I had given all the love my nature was capable of? Was it strange when I found the peace of an undivided house, that I should have been content and happy there, although that house stood in what our city friends were pleased to call a wilderness? Now, I fully appreciated my good fortune and made many silent vows that I would do my part and a little more; in fact, should the occasion demand it, I would cheerfully yield personal likes and dislikes, rather than strike the first inharmonious chord. Had I not had full confidence in my companion's honesty of purpose, and a firm belief that he studied my interests from an unselfish point, my personality would never have allowed me to think of accepting unchallenged his "say-so." So much for untried, non-tested intentions. But the atmospheric effects of the divided house followed me into the entire house, and owing partly to the faulty training of 20 years and partly to natural peculiarities, I haven't the slightest doubt that, but for the judicious and just treatment accorded me, my house would not only have divided, but gone all to pieces.

It amuses me to hear a married woman assert that she will meet a man half way every time, but further she will not go! No need to be told more; the story is short but pages could not have explained the situation better. No couple ever lived peaceably upon the meet-me-half-way platform. In every real and true union, either the husband or the wife yields to the other's opinions and prejudices, but love and devotion take from the yielding every sting, making it an almost spontaneous act, but it is yielding all the same. Of course, I have taken the premises that the husband and wife are just and right-minded persons.

It is not to be expected that persons having different blood in their veins and having been brought up under different conditions and traditions should feel and think alike in every little thing; it would be absurd and neither husband nor wife has any right to expect or require anything of the kind. But if their hearts be right they will not stray far apart, and love, confidence and respect are strong rivets that will withstand many a petty wrench.

"You go your way and I'll go mine." Dangerous paths for man and wife to take. "You have your interests, and I'll have mine." Breakers ahead! The house *will not stand.* Divided interests are dangerous—the house first shakes, then totters and falls. To be plain-spoken, if their house is to stand, man and wife must be united on all important matters. There must be unity of interests—no pulling in different directions, but good, steady drawing together, no matter how rough the road or how steep the hill.

When I hear a couple say that they have never quarreled or differed one with the other, I at once conclude one of two things is true, that either the statement is altogether false or that one of the parties is a wishy-washy person, void of decided characteristics. I have sometimes thought that the deeper the affection the fiercer the quarrel.

Whether married life proves a failure or not de ends altogether upon the goodness of character of both husband and wife. There must be a metal underneath that neither tarnishes nor wears away, something to which each can anchor, for the storms of every-day life so beat against the structure that if it be not founded upon the unalloyed rock of goodness, it cannot withstand the strain—it parts and the dearest, most sacred relations known stand exposed to the curious gaze of the world.

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria

A TALK TO THE GIRLS.

I WAS very much interested in what our little friend says in "Our Aim in Life" under Domestic Economy (in the issue of March 9) Yes, we must all have an *aim* in life if we would succeed The man or the woman who drifts along from day to day without caring for anything or anybody—who is willing to float with the crowd—who never takes the trouble to think or act for himself or herself, will never amount to anything. The use of our muscles strengthens them and gives them more power. So with our reason, our mind, our intellect. The more we *use* them, (not *abuse* them) the greater power and strength they gain.

Our little friend spoke of the desire to learn; to obtain knowledge, and from what I know of her I am sure she is on the right track. But don't imagine because Miss So-and-So is studying this or that "ology" and you are not, that, consequently, she knows ever so much more than you do. Perhaps she knows more of that *one* thing than you do, but if you study each thing as you come to it *earnestly* and as thoroughly as you can, conquering as you go, you will finally succeed. The number or kind of books one studies does not determine how much one knows. It is how much one can grasp and understand; how much one can assimilate, as it were, that determines this.

Studying by rote, committing long pages to memory is not, as many suppose, the best way to learn. Of course, it is better to learn that way rather than not at all, for perhaps the understanding may come later. But to take paragraph by paragraph and *understand* it, is the true way. Perhaps in a month you might not be able to repeat a single line *verbatim*; but, if you thoroughly understood what you studied, you could at once, in your own words, explain it. Don't try to do too many things at once, but do what you do, *thoroughly*. Study your grammar, the construction of sentences, and punctuation. These three things will be of great importance to you in all your after life. Read—broaden your knowledge in this way. Don't read all the trash you come to, but read every good thing you can find time to read. If a thing is worth reading at all it is worth giving your whole attention to it. The habit of "skimming" through dozens of trashy novels should not be indulged in by any one who cares to improve. Some say, "Oh! I only read them for pastime or recreation"—but do not do it for "pastime" even Go out of doors and take a brisk walk if you do not feel like reading anything that will require thought. Have a romp with your dog. Play with baby—or, if you cannot do any of these things, get your needle and thread and mend up some neglected garment, or write a letter to some neglected friend or relation. If you are not in a condition to read anything that will benefit you, you certainly are not in a condition to read at all. "We must either progress or retrograde" as our dear old Sunday School Superintendent used to say to us every Sunday of our lives, (and I remember wondering if I "retrograded" every week where I'd finally get to). It is so in all things. We do not stand still. If we do not improve with the days and weeks as they come and go, we go backwards. Time does not stand still, and even if we did not go backwards, it would soon have left us far behind, carrying others ahead in the march of improvement

Read the daily papers—not accounts of murders and crimes, but topics of general interest throughout the country or State. Know what is going on around you; keep yourself posted as to all important events relative to both National and State Government; for it is just as important for a girl to know who rules her as it is for a boy. If you do this you need never resort to the poor old weather for a topic of conversation (unless your acquaintances don't know anything about these things.) To keep up with the times is important for many reasons. Suppose you were the finest musician in the world, you couldn't be forever at an instrument, and it would be, as well as seem, very egotistical always to talk of the one thing you excelled in. Suppose you were the best botanist in your State, you could not talk "botany" to everybody, for everybody couldn't appreciate it. Suppose you were a fine Latin or French scholar, you could not talk Latin or French to every one you meet, for nine out of 10 could not understand you.

The greatest gift one can ask for is "*Adaptability*" To be able to put yourself in harmony with whatever condition you meet with as you journey through life, is the greatest blessing possible. To be able to sit on a rickety chair and talk to a dirty youngster with as much ease as to rest on the softest of velvet couches and converse with a cultured friend, or *vice-versa*, is a gift which some possess; and some, too, whom I know have had very little chance for education, outside of what they have gained by their own hard work and determination. Always come down to the level of the one to whom you are talking, or else try to get up.

Talk to a child so that he or she can understand you. If any one talks of something you do not understand, be brave enough to own the fact; ask for the information you crave, and remember it when received. That is, of course, supposing you are alone in conversation with one or two. If you hear things spoken of where you cannot ask for information, go as soon as you can do so and endeavor to find out. If you do this *always*, you will learn far more than you ever dreamed of, and your knowledge will be far more varied and extended than it could be by studying from a text book. Keep your eyes and ears open. "He that hath ears to hear, let him hear, etc." Many of us, with bright eyes, too, go along from day to day seeing nothing but what is called to our notice, while others take in everything that comes along. Perhaps they don't say anything about it at the time, but what they have seen (or heard either) is stored away for some time in the future.

Wake up! Use the faculties God gave you. Make the best of what you have. Nobody need be stupid in these days unless born an idiot, and even then, with a little trying, he needn't be as big an idiot as some "other feller." DORA HARVEY VROOMAN.

KITCHEN TALKS.

ANNIE L. JACK.

THE bread was white and sweet, but the last panful of biscuits were sour.

"The dough was too long standing before the fire," said one.

"The biscuits were too slow cooking in the oven," said another cook. Then we talked of the different degrees of heat of the oven for baking, and how to ascertain the proper temperature.

"I used to put my hand in and hold it till I counted 20," I said; but an easier and less troublesome plan is to sprinkle a little flour on the baking sheet. If it browns in two minutes the heat is about right. The temperature cannot be easily told by the thermometer; but one of 550 degrees is good to begin with.

Some of the family are fond of potato scones, which are very nice for breakfast or tea. They are made by rubbing one pound of cold boiled potatoes through a sieve. The "dough" is put on the baking board and eight ounces of flour are scattered over it. Next, it is worked with the rolling-pin till smooth, then rolled and cut into squares or corner-shaped cakes the thickness of half a dollar. These are placed on a clean, hot stove and, when a little brown, turned over. When done, serve hot in a napkin.

There are some who insist that the soup course at dinner takes away their appetite, and who do not believe that it is nourishing: but this is a mistaken idea, and a good soup should be taken every day, as it helps the food to assimilate. It should not be regarded as a luxury, or as used only by the poor; but it should be considered indispensable to a complete dinner. A soup, or rather, stock kettle should be on every kitchen range to hold all the bits of meat and bones. Some people are careful to remove the albumen or "scum" as it is called. A favorite soup which has a very distinctive flavor is made from a calf's or sheep's head. There is one thing certain—in a large family there is nothing more economical than soup, yet it is often found that several members of such families refuse it for one reason or another, and as one of the rules at table is that all must have a serving, the refusal of it by any sometimes leads to waste.

A good potato soup can be made in three-quarters of an hour with a little soup stock. Nothing is needed but six large potatoes, a little chopped parsley and celery and a tablespoonful of browned flour put in with the seasoning. It is a soup that some of the children prefer to any other.

What a steady care the three meals are. They crowd upon us during the short days of winter, and in country places, where no markets exist, happy is the household that has been forehanded enough to have sufficient stored away to last the season through.

What shall we have for dinner cannot be settled by any of the cook books. To decide, needs constant and intelligent thought when the means of the household are so limited as to make economy necessary. Meanwhile the kettle boils, and the sunshine streams into the windows There is a feeling in the air of mild brightness—and an old Scotch neighbor tells me that "the back o' winter is broke" I am sorry when spring comes for one thing, and that is, the loss of our long, quiet evenings. But every drawback has its compensations, and the lingering rays of sunshine, the long spring days, should be full recompense for the length and quiet of winter evenings.

BABIES.

"BABIES are natural travelers" said a friend, and I was quite inclined to believe it when I found with how little fatigue my own five-months-old baby endured a journey of 2,500 miles. Three days and three nights we were on the wing—of course, we took a sleeping car. A nursing baby is at home with its mother almost anywhere, and when baby was once behind the curtains, away from the glitter and light he was quiet, and asleep even sooner than in his own home, for after the first night the motion of the train had a lulling effect How I dreaded to expose the baby to the dangers of such a trip! Fears of colds and contagions rose up like a night-mare; but it was run the risk or never see a dear friend again in this life, so at a few hours' notice we were off. Older babies—those who can walk—are harder to take care of on a journey. One mother kept her babe of 17 months quiet with a

SCRAP-BOOK

In which the little one's favorite pictures were pasted. The leaves of the book were perhaps 12 inches square, and were made of differently-colored cambric, and pinked around the edges. These were fastened into strong cambric-covered covers, and the baby had a very serviceable picture book to occupy herself with. The best

TOILET-POWDER

ever used for a chafed child is sub-nitrate of bismuth. It will adhere to the flesh until it is healed unless washed off. S. E. H.

DOUGHNUTS.

ONE quart of flour, one cup of sugar, one teaspoonful of salt and one of soda, half a teaspoonful of cinnamon or the same quantity of grated nutmeg. Mix these ingredients thoroughly together, then stir in one pint of sour milk, partly cream, and roll out. Cut in shapes and fry in hot lard. MRS. B. C.

BAKED INDIAN PUDDING.

A SCANT half-pint of sifted Indian meal, a half-pint of molasses, two tablespoonfuls of butter, one quart of milk. Bring the milk to a boil in a double boiler, or pail, set within a dish of hot water, and then stir in the meal. Beat until smooth, add the molasses and butter and stir until the mixture thickens. Add a little salt and pour into a buttered earthen dish. Bake slowly two hours, then stir up from the bottom and bake a half hour longer.

CARAWAY SEED COOKIES.

ONE cup of butter, two cups of sugar, four eggs, whites and yelks beaten separately, one cup of creamy sour milk, one full tea-spoonful of soda and one of salt, two table-spoonfuls of caraway seed and about seven cupfuls of sifted flour. Mix salt, soda (made smooth) and butter and seed through the flour. Beat the yelks of the eggs with the sugar, then the whites and drop the mixture into the flour. Stir in the milk slowly, mixing all thoroughly together. Roll out, sprinkle sugar over the top and cut in rounds or strips.

News of the Week.

HOME NEWS.

SATURDAY, March 16, 1889.

AMONG the measures which died with the dead Congress was the bill creating the Territory of Oklahoma, and opening it to settlement. Some of its provisions were, however, incorporated with the Indian Appropriation bill. No Territorial government is to be established, but an area of about 4,000,000 acres in the Indian Territory is to be thrown open to settlement by proclamation of the President, when commissioners to be appointed shall have bought it from the Indians on terms mentioned. It is to be settled exclusively by actual settlers, under the Homestead Law, but no person is permitted to enter upon or occupy any part of the land before the President shall have proclaimed it open to settlement, and anybody violating this provision shall never be permitted to "enter" any part of the land or to acquire any right there. It was at first supposed that all the provisions of the Oklahoma bill had been embodied in the Indian Appropriation bill, and the "boomers" in the Southwest were vociferously jubilant; now they are justly despondent or desperate. A large number of them have already taken up claims in the land. Others have been waiting for months or years to do so. Lots of them have been waiting on the confines of the Territory, in Texas, Kansas and Arkansas, and nothing can hold them back. Within a week, over 2,500 of them will be in the country, and additions will be constant and multitudinous. The U.S. troops at Fort Reno are preparing a campaign to expel the intruders, but the latter say it can't be done. Much trouble is feared.....

Our Endorsement is Result.

It is the incessant drip and drop upon the surface of the stone that finally makes the impression.

So there need be no question, after this statement, why it is we so persistently present these little bulletins of Compound Oxygen for your consideration.

RICHMOND, VA., March 26, 1887.

"I am happy to tell you that my husband has greatly improved since taking this second treatment, and has been relieved of his *rheumatism*. He finds his *digestion* almost perfect now and no pains save from rheumatism. MRS W. L. WARING

RICHMOND, VA., May 18, 1887.

"Mr. W.'s improvement from your Compound Oxygen is so perceptible that my nieces decided that they must have it as a trial for their difficulties. Our friends see for themselves the marked improvement in him."

MRS. W. L. WARING.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery St., San Francisco, Cal.—*Adv.*

AGRICULTURAL NEWS.

SATURDAY, March 16, 1889.

WITH regard to crop outlooks, in the West all the frost in the ground is the result of recent freezing. There is very little snow except in Michigan, portions of Wisconsin and some parts of Minnesota and Dakota. The impression in the spring-wheat section is that farmers will seed every acre possible. The season is unusually early and in some places farmers have been seeding during the past week. Owing to scarcity of good seed, the bulk of the crop will be sown with frosted seed, and farmers are anxious as to the results on the yield and quality of the crop..... Professor Green, of the Minnesota State Agricultural College, has completed a series of experiments to ascertain the value of frosted grain for seed. His report shows that from 40 to 90 per cent. of the total amount planted will sprout and grow. He says that his experiments may be relied upon and that hereafter farmers may plant frosted grain with the assurance that it will grow, rather than run into debt for seed. Oliver Dalrymple, the bonanza farmer, of Dakota, and the largest wheat-grower in the Northwest, is inclined to believe that the experiment can be safely relied upon, and will make further experiments on his 40,000-acre farm..... The new Meat Inspection law, framed with a view of prohibiting a sale of "Big Four" products in New Mexico, went into effect Wednesday. The law provides for the inspection of live animals intended for human food, prohibits the sale or use of uncured meat of uninspected cattle and hogs, and forbids the sale of imported fresh meats.....The Iowa State Experiment Station has expended every cent of its $15,000—$3,000 for building, $4,958 for books and apparatus, $1,418 for equipments, $2,084 for salaries, $2,631 for supplies and expenses, $813 for labor, and $96 for printing ..... The Farmers' Alliance of Nebraska has adopted some doleful resolutions which have been referred to the State legislature, and by that body in turn to Congress, calling attention to the fact that while the production of wealth in the country is unprecedented, the condition of the producers of wealth is not improving, but on the contrary retrograding. The farmers, says the Alliance, are sinking deeper and deeper in debt; many who were once owners are now tenants; mortgages are increasing and now amount to over $150,000,000 on the farms of Nebraska; and, withal, country merchants, artisans of all classes and laborers as well are losing ground in the anti-poverty struggle. The Alliance says that money lenders and railroad officials and owners are about the only classes safely prosperous. They ask for legislation that shall save them from ruin, and among other things pray that Congress will make money more plentiful by issuing more greenbacks.....

THE BURLINGTON'S "ELI."

The formerly popular Vestibule Fast "Eli" Train of the Burlington Route has been resumed between Chicago and Kansas City, St. Joseph and Atchison, leaving Chicago daily at 5.30 P. M. The Burlington's Vestibule Trains to Omaha, Denver and St. Paul will continue as before. They are the best trains between Chicago and the points mentioned. FOR A DIME I will tell you of a **Remarkable Cure** for indigestion and constipation which the Bible mentions. It grows in your gardens and fields in abundance. MILTON COOK, New York City.

The Kodak.

PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be re-loaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker.

The Eastman Dry Plate and Film Co.

ROCHESTER, N. Y.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD.

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

"DON'T 'e go there, Parson," she said to him.

"I must, Mrs. McKelvey, it is my duty," he said gently.

The woman looked at him curiously for an instant. "Did 'e h'ever see 'er before Parson?" she asked quickly.

The minister looked her full in the face as he answered: "I have."

She understood him.

Mr. McKelvey, unseen by his wife, had stepped out at the back door, and was now on his way to the trouble. The minister saw him just ahead as he walked up the street.

It was a terrible scene they looked upon at last. The Drum Lakers seemed to have been suddenly seized with a fit of virtuous indignation. Such fits are common to our northern civilization. I do not know whether it was the minister's sermon that roused them or not, but they had determined to purify the place by removing all the objectionable characters. They had begun with "Sarcy Sal." Finding her just after her interview with the minister, she was in the condition to provide great port.

It was indeed a dreadful scene. A crowd of a dozen or more men were gathered in front of a dry-goods box on which stood the dying woman. Her eyes were ablaze with fever. The gaudy hat had fallen from the head, and the beautiful hair hung down over her face and neck. With bitter taunts, she held the crowd at bay, all but one man, a great, black-bearded fellow who stood directly in front and urged the rest to pull her down.

No wonder the Parson hesitated and half turned back at the sight. Could that be a woman, and the woman he had loved so well?

Mr McKelvey pushed his way into the crowd just as the black-bearded man caught sight of the minister.

"Look here," the ruffian cried tauntingly, "here's the parson come to see yer?"

The woman replied with a taunt so bitter that the man caught up a lump of ice and threw it in his anger directly at her. It struck her full in the face. She staggered, threw both hands to her head and fell from the box headlong into the snow.

Two men pushed through the crowd and bent over her. They looked at each other as she lay in the snow—Jack Gray and the Parson.

The black-bearded man tried to push his way to her side, but brave little Mr. McKelvey stepped in front of him.

"Stand back," roared the little Englishman; "s'and back or I'll whip 'r all."

"Git out the way Bill McKelvey, jist go an' air yer voice," and he pushed the little man back.

Jack Gray was on his feet. "Stand back, boys," he shouted. "You've had yer fun; now quit. She's bad enough, I know, but she's a *woman* boys arter all."

The majority of the men were ready to stop, but the black-bearded man still pressed forward.

"What's the matter with you, Jack Gray? How long sence you hev ben Sunday School Superintendent? Superintendent Gray, boys; crowd up!"

Jack's hand went like a flash into his pocket. An instant more, and the barrel of a revolver, flashed in the black-bearded man's face. There was a sharp click as Jack coolly said:

"You bet I'm Superintendent Gray, an' I'm a superintendin' *you*."

The black-bearded man held up both hands and stepped away. This manner of object teaching was not to his taste at all.

SHREWD ADVERTISERS.

READERS of the newpapers of the day cannot fail to be impressed with the fact that the modern advertiser is progressive.

He is compelled to be, else competitors more active in the invention of new advertising devices, will outstrip him in public favor.

The value of printer's ink judiciously and scientifically employed cannot be overestimated; it is the medium whereby a meritorious discovery is raised from local fame to a position in the public esteem. Hence the columns of the newspapers are daily used by hosts of advertisers and in the competition which is indulged in to attain the desired end, the reader is oftentimes amused.

The greatest of American advertisers, and it may as well be said in the world, is H. H. Warner of Rochester, N. Y., whose name has been made everywhere familiar in connection with Warner's Safe Cure, widely advertised because of its merit in the prevention and cure of kidney diseases.

By printer's ink, this great discovery has achieved world-wide popularity and thousands feel grateful for the knowledge thus acquired of this greatest of modern remedies.

Furthermore, the public has been taught that disorders of the lungs, brain, heart and liver which have hitherto been regarded and treated by the profession as distinctive diseases are not so in fact, but are the attending symptoms of disease of the kidneys; therefore, the consumptive, the apoplectic, paralytic, and the sufferer from nervous disorders can be restored to health by Warner's Safe Cure, which will remove the true cause of those disorders by restoring the kidneys to healthy action.

The advertising methods employed by this greatest of advertisers are invariably instructive and, although the reader may sometimes be "caught" in reading an advertisement, which was not at first supposed to be such, there is nevertheless no time lost since useful information is invariably gained concerning life's great problem.

CONSTIPATION, followed by fitful diarrhœa, shooting pains in the breasts, drawing down aching pains, burning sensation in the small of the back, scanty, dark-colored fluids which scald in passing, and many deposits—sand, mucus, tube casts, and fluids covered by a greasy scum; any one of the foregoing signifies advanced kidney trouble. Prof. Wm. H. Thompson, M. D., of the University of the City of New York, says: "More adults are carried off in this country by chronic kidney disease than by any other one malady except consumption." The late Dr. Dio Lewis, in speaking of Warner's Safe Cure, said over his own signature: "If I found myself the victim of serious kidney trouble I would use your preparation."

SPRAYING FRUIT TREES
to destroy injurious insects is recommended by all experienced Horticulturists and by this system only can perfect fruit be secured. For full directions and outfit for hand or horse power, address

CHOICE TEXAS LANDS
Rare Chance for Settlers.
The Railroad System of Texas having developed so as to bring within easy access of good interior and seaboard markets the lands granted to the
HOUSTON & TEXAS CENT'L RY. CO.
It has been determined to offer to settlers the
Renowned Agricult'l Lands
Located along the line of the Fort Worth & Denver City R. R., beginning with Wilbarger County, comprising
200,000 ACRES
In farms of 160 acres and upward. These lands were located by the Company among the earliest, with especial care as to soil, timber and water. They are adapted to the growth of cotton, corn, oats, wheat, barley, rye, vegetables, orchards and gardens and the various domestic grasses.
Situated in the elevated and healthy region known as the Southern Panhandle of Texas, they possess a *genial climate,* favorable to man and beast, where outdoor work can be carried on the year round, and are in marked contrast with regions of early and late frosts or of destructive "blizzards."
Population is fast pouring in, and local government is already established, with schools, churches, &c.
TERMS OF SALE: One-fifth cash, balance in four equal yearly payments, with interest on deferred payments.
For further information as to these and lands in adjacent counties, apply to
J. S. NAPIER, Vernon, Texas,
(who is prepared to show to purchasers); or to
C. C. GIBBS, Land Ag't, Houston, Tex.

$20 Picket Fence Machine for $10.00. *Guaranteed.* Hundreds in use. Freight paid. Circulars free. S. H. Garrett, Mansfield, O.

WHO laughs last laughs best. Before you lost your hair you laughed at your friend's bald head. Now your friend laughs at you. Use **Warner's Log Cabin HAIR TONIC** and renew your hair, then you can laugh again. $1.00—of all druggists.

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

ARREARS OF TAXES.

L. T., Albany, N. Y.—A short time ago, I came by collateral inheritance into possession of a small but valuable farm which I supposed was free of all "incumbrances." Not long afterwards, however, just in time to prevent its sale at public auction, I discovered that there were against it claims for arrears of taxes which had been standing on the Tax Commissioner's books for 25 years. Wasn't such a debt outlawed by the statute of limitations the same as any other debt? Isn't it the duty of the Tax Commissioner to serve a notice, or cause any arrears to be noted on the first tax bill rendered after any assessment has been levied or any deficiency of payment or charge against the property has occurred? If this is not the case, the present condition of the law exposes the owners of taxable property to a liability to much annoyance and heavy loss.

ANS.—The statute of limitations does not run against debts due under the statutes for the collection of taxes. There are two provisions of the laws of this State, however, which, if properly enforced, afford some protection to tax-payers. It is the duty of the Clerk of Arrears of Taxes, upon requisition of any person, to furnish a bill of all arrears of taxes due prior to the first of June last past. Moreover, "whenever any tax and interest thereon shall remain unpaid for two years from the first day of May following the year in which the same was assessed, the Controller shall, as soon thereafter as he shall deem it for the best interests of the State, proceed to advertise and sell such lands". Notice of the sale must be given to the owner. Probably the courts would not hold that such a clause as the above would give the Controller a right to delay the sale for 25 years, especially as it is the duty of the tax collectors to make diligent search for property on which to levy for the payment of a tax as soon as it is over-due. All tax bills rendered in this city must contain a record of the arrears of taxes on the property covered by the bills, and this practice should be of general application.

INHERITANCE OF A POSTHUMOUS CHILD.

T. S. M., Medina, N. Y.—A gave by will half of his large farm and other property to his second wife and half to his child by the first marriage, no child having been born by the second marriage at A's death. About six months after his death, however, his widow bore a child. The will was contested on behalf of the second child against the other child by the second child's mother, and, in default of an answer or appearance, the second child received his share of the property bequeathed to the first child. Shortly afterwards the child by the second marriage died Who is now entitled to the second child's property—the mother alone or the first child, or is the dead child's share of the property to be divided between them? If the mother is entitled to the whole; could the child of the first marriage re-open the contest, which was lost by default?

ANS.—The child of the first wife and the mother of the second inherit the property share and share alike. There could be no valid defense to the claim in behalf of the posthumous child. It legally inherited that portion of its deceased father's estate it would have received if there had been no will, as every child born under such circumstances in this State must do if no provision is made for it in the will.

DRAINAGE FROM UPPER TO LOWER LAND.

J O., Henry Clay P.O., Del.—I have a piece of land that needs drainage. The water from the drains would run on my neighbor's land, as the inclination of the field is in that direction. Have I a right to let the water flow on his land in case he is unwilling to grant permission? Can I legally discharge the drains at one point on my own land, near my neighbor's line fence?

ANS.—The drainage laws of the different States vary considerably. The statutes of most of the States provide for the construction of county and township ditches, but in only a few is any provision made for private ditches, like that here referred to. The principle governing such cases is that when two fields are adjacent, and one is lower than the other, the owner of the upper field has a legal right to have the surface water—the water that falls upon his land—flow off upon the land below it; but he has no right to collect the water by drains or other artificial means, and discharge it upon the land of his neighbor to his injury. By so doing he renders himself liable to an action for damages.

DEEDS AND MORTGAGES MUST BE RECORDED

"*M*," *Gilbertsville, N. Y.*—A gives B a mortgage on his real estate. Thirty days afterwards he gives C a mortgage on the same property. B neglects to record his mortgage until after C has recorded his. Which has the first claim?

ANS.—B must suffer for his negligence. Washburn on Real Property, page 536--537, and 4 Kent 173, agree that the records of a town or county in which lands lie are supposed to give full information of grants or liens affecting a title, and any one who has a deed or mortgage which he fails to put on record, is liable to have his rights cut off by a subsequent deed or mortgage from the grantor. This record constitutes public notice to all future mortgagees or purchasers of the land. Had B recorded his mortgage, the record would have given C notice of the previous mortgage, and if he was not in any way notified of the existence of such mortgage, his own mortgage having been duly recorded must take precedence of B's. B's remedy is now against A.

TAXATION FOR RAILROAD-BUILDING BONDS.

L. S, Hastings, Neb.—Ten years ago a town in which I own a farm, under the general railroad law issued bonds to aid in the construction of a railroad through the town, the bonds to be payable in 30 years and the interest thereon annually. Are the bonds a lien on the real estate within the boundaries of the town at the time of bonding?

ANS.—Bonds issued by a town for the construction of a railroad or any similar purpose, are not a lien on the real estate of individuals. The town, however, must pay the interest and the principal when due, and the proper officers can be legally compelled to levy a tax sufficient for the purpose, and in case they refuse to do so, they can be punished for contempt of court, by the judge who ordered the assessment. Such taxes when laid, are a lien on the real estate upon which they are assessed, and must be paid before a good title therefor can be given, and of course the property may be sold for unpaid taxes.

S. T. L., Bath, N. Y.—A short time ago I bought a farm in another part of this State, for which I have paid in full and received a release or satisfaction piece. Is the seller legally obliged to give up to me any former deeds, releases or other kinds of receipted bills affecting the property?

ANS.—No; the seller of the property is legally obliged to give only his own deed; and the mortgagee, when a mortgage is canceled is compelled to give a satisfaction piece to cancel the mortgage. Neither party is obliged to give up any former deeds or releases that may be in his possession.

C. H. M., Bristol Springs, N. Y.—There are no public landings on the shores of Canandaigua Lake. Those who ship grapes and other freight without owning land on the lake must ship from private docks. Should this privilege be denied, would the aggrieved party or any one else have a right to build a dock on the lake where a public highway comes to the edge of the water, without the consent of the owner of the adjacent land?

ANS.—No. Unless there is a law already relating to the matter, the only relief is through the legislature by getting the Assemblyman for the District to introduce either a special bill for this case or a general bill applicable to all cases of the kind in all the waters of the State.

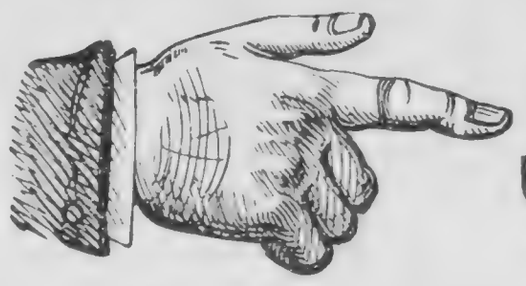
Send for "How to Cure Skin Diseases."

Pimples, blackheads, chapped and oily skin prevented by CUTICURA SOAP.

Rheumatism, Kidney Pains and Weakness speedily cured by CUTICURA ANTI-PAIN PLASTER, the only pain-killing plaster.



JULY 1st

The subscription price to the LADIES' HOME JOURNAL will be doubled. It will be better and larger. We shall double its value and give you more of it for your money. You may have the APRIL, MAY and JUNE numbers for the merely nominal sum of TEN CENTS, and if you like them, a yearly subscription can be had for half what it will cost after July 1st.

This is the last opportunity to try the *Journal* at so small a cost. This advertisement appears but once.

Special Features are,—AN ILLUSTRATED ARTICLE ON NEWPORT,

—BY—

Florence Howe Hall,

Showing life there in the gay season — the beach, dinners, balls, musical parties, polo, life on the yachts, beautiful villas, &c.

Another feature will be STATE BANQUETS,—Presidential porcelain of a century, illustrations showing pieces of every state dinner set from *Washington to Harrison*, also the conservatory,—a state dinner, &c.

AMATEUR PHOTOGRAPHY—Profusely illustrated, is another practical subject to be found in May and June numbers.

HOW TO GO ABROAD with the least trouble and expense. Explains just what is necessary to take with you for use on ship board, and on the Continent, and what *not* to take. Money matters in detail. Valuable advice on custom inspection, care of baggage, fees. Tells how to avoid a thousand and one mistakes and inconveniences suffered by inexperienced travellers.

These special numbers contain KATE UPSON CLARK'S story, "TOO MUCH ENTERTAINED." "JOSIAH'S OBITUARY," by JOSIAH ALLEN'S WIFE. Concluding chapters of "MILDRED'S AMBITION," a story of social ambition by Mrs. MARY J. HOLMES. "WEDDING BREAKFASTS," by ELIZA R. PARKER. "HOME DRESS MAKING," a complete fashion department. "ARTISTIC NEEDLEWORK." "FLOWERS AND HOUSE PLANTS," by EBEN E. REXFORD. "TALKS WITH MOTHERS," by Eminent Physicians.

CURTIS PUBLISHING CO., Philadelphia, Pa.

Mass.	MAPES CORN MANURE.	4.40	4 50	13.45	10.00	6 36	6.00
N. J.	MAPES PEACH TREE MANURE.	3 29	2.00	10 28	8.00	9.11	8 00

No salts of Potash combined with Chlorine are used in any of the above Manures for Tobacco, Potatoes, or Fruits (excepting the Peach Tree Manure).

It will be noted that in the above Manures there is a range of composition that enables the grower to select a grade suitable to almost any want; Ammonia from 3.00 to 8.52 per cent. Phosphoric Acid from 5.42 to 13.69 per cent. (nearly all soluble and available), Potash from 3.00 to 11.92 per cent. and free from Chlorine for use on Tobacco, Potatoes and Fruits.

For comparison in strength between the Mapes Manures and other brands, see pages 39 and 40 **in the Mapes Pamphlet, 1889.**

All of the Mapes Manures are in DRY, fine mechanical condition, and at the same time contain **more soluble and available plant food in a ton** than any other special crop, complete manures, or any superphosphates made, and pound for pound will go over more ground and prove more effective than if **moist, coarse or sticky.**

FULL DIRECTIONS FOR USE PLAINLY PRINTED ON TAG ATTACHED TO EACH BAG (200 lbs each).

The Mapes Manures do not deteriorate with age The Ammonia is all "fixed."

The Phosphoric Acid and Potash contained will last in the soil until used up by the crops, for thirty years and over.

The basis of all of the above manures is **Bone—no Rock** used. All the materials used are of the very **best kinds known to science and practice.**

THE MAPES MANURES ARE TRUE MANURES, NOT STIMULANTS.

By the continued use of the Mapes Complete Manures, in some cases for 10, 12 and 15 years, Farmers, Truck and Fruit Growers report their land as having steadily improved in condition, and their crops double and more than double those formerly grown; also quality of crops greatly improved and profits largely increased.

Send for DESCRIPTIVE PAMPHLET with price list containing detailed accounts of how the unprecedentedly large crops of potatoes, corn, tobacco, fruits, trucks, etc., etc., were grown. NEW BUCKEYE Sunbeam COMBINED RIDING and WALKING CultivatoR

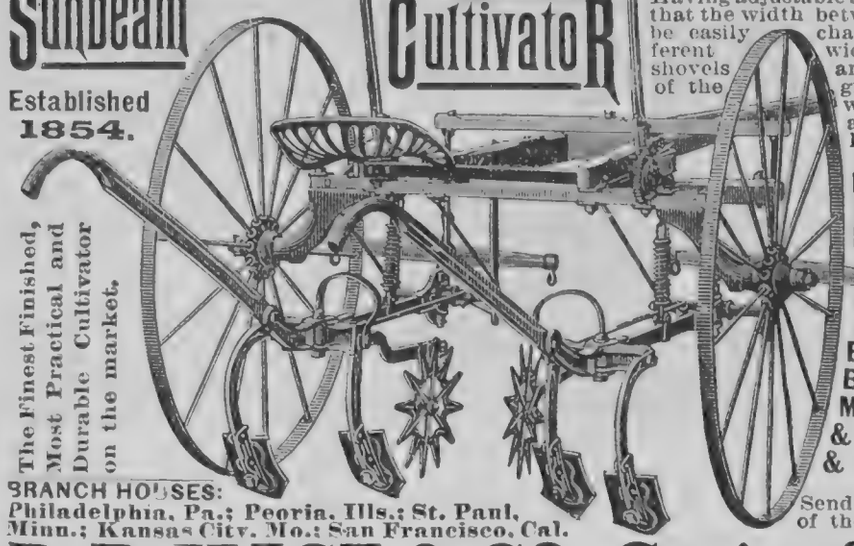
Established 1854.

The Finest Finished, Most Practical and Durable Cultivator on the market.



This CULTIVATOR has four Shovels, rotary or drag shields, levers and adjustable axles. Is easily adapted to be used either as a **Riding or Walking Cultivator,** and is conveniently operated either way. Having adjustable axles, it is so arranged that the width between the wheels can be easily changed to suit the different width of corn rows. The shovels are easily raised out of the ground by the lever when turning around at end of row, or upon leaving the field.

Also furnished with **Metal Wheels and Pivoted Parallel Beams.**

Also manufacturers of the **Buckeye Drill, Buckeye Seeder, Buckeye Cider Mills & Hay Rakes, & Lubin Pulverizer & Clod Crusher.**

Send for Circular to either of the above firms or to

EVERY drop of blood in the system passes through both the kidneys and lungs many thousand times in each twenty-four hours. This explains why 52 per cent. of the patients of Brompton Hospital for consumptives, London, England, have unsuspected kidney disorder. If the kidneys were in a healthy condition they would expel the waste matter or poisonous acid and prevent the irritation of the lungs. But if diseased they are unable to perform their functions. This explains why Warner's Safe Cure has proved so valuable in cases of lung trouble. It removes the cause.

Biographical.

THE NEW SECRETARY OF AGRICULTURE.

JEREMIAH McLAIN RUSK, the new Secretary of Agriculture, was born in Morgan County, Ohio, on June 17, 1830, and is therefore in the 59th year of his age. He is six feet two inches in hight, and massive in proportion, active, bright, and—the ladies say—handsome. On a horse, or heading a procession, or in a promiscuous gathering, he certainly is, with his white, flowing hair and beard and ruddy complexion, a man of marked and attractive personal appearance. An excellent picture of him, engraved directly from a photograph, is shown at Fig. 77. His public career, from the incisive and courageous manner in which all duties, especially in sudden emergencies and trying times, have always been performed, is pretty generally known. That we shall therefore touch lightly.

In 1853, at the age of 23 he settled on a farm in Vernon County, Wis., which is still his home, where his shrewdness, good sense and natural aptitude for leadership at once placed him at the head of pioneer improvements and public affairs. He was successively elected to several county offices; sent to the legislature in November, 1861; elected State Bank Controller in 1866, holding the office four years during the trying time of bank reorganization; served in the 42d, 43d and 44th Congresses, promoting during that time some of the most practical and important pension legislation on the statute books; was appointed by Pres. Garfield and confirmed by the Senate Minister to Paraguay, which office he declined, as he did also the Mission to Denmark; was elected Governor of Wisconsin in 1881; re-elected in 1883 and again in 1886, holding the office seven years.

Of course, he went into the war, having enlisted early in 1862 as major of the 25th Wisconsin regiment. He was soon promoted to the colonelcy. After suppressing an Indian revolt in Minnesota, his regiment was sent South, and he served with Sherman from Vicksburg to the close of the war. During the last campaign he had charge of the advance of the 17th corps, and was breveted Brigadier General for bravery at the battle of Salkehatchee. He was a dashing and intrepid soldier having the full confidence of his men as well as of his superiors. He never ordered the boys to "go," but always led the way and bade them "Come on!"

After his father died, in Ohio, Rusk while still a boy, was compelled to put forth extra exertions to help support his mother and two sisters, and for that purpose, as the nearest and best thing at hand, learned the coopers' trade. It is a fact not generally known that he became a first-class cooper, and to this day can put up a "tight" or "loose" barrel as well and quickly as the best journeyman. He always made money from his farm, and during his long and busy public career never relaxed his active interest in agriculture. Though especially fond of fine horses and cattle, he also directed attention to other branches of farming, and it was common fame that there was no man in the country who could match him with the scythe or cradle, or at raking and binding grain. In fact, his quick, sure eye and superior physical strength and activity gave him easy and graceful mastery of almost everything his hand found to do. In short, he was equal to every emergency.

When he first proposed to be a candidate for Congress the late Wm. T. Price, the most tenacious and crafty fighter of his time, was his opponent for the nomination. Buffalo county seemed solid for Price; but Rusk must know for himself whether that county was invulnerable. Therefore, in company with a political friend named Bryant, he journeyed over into the fastnesses of Buffalo to "see about things." Finding the local leaders had gone to a particular neighborhood to test and observe the workings of a new thrasher, the General and his friend sought them out. The crowd, as had been reported, was perverse, obdurate. "We're all for Bill Price—don't want no Rusk in ourn."

Pulling off his coat, the General stepped up to the man who was feeding and observed: "You go down and talk with Bryant awhile and just let me show you fellows how to feed a thrashing machine." The crowd laughed derisively, for the candidate had on his "store clothes" and hardly had the appearance of a thoroughbred "thrasher." But the feeder descended to the ground and brightened up the steam, thinking he would "have a little fun with the fine politician," while the latter mounted the platform and began to toss in the grain in a style the boys had never before seen equaled. While he was putting in the bundles Bryant was putting in his persuasive language and the crowd was captured. They hurrahed for Rusk, saying a man who could stuff a thrasher like that was good enough for them. He had a solid delegation from Buffalo, and was nominated.

Many years later Governor Rusk—for he was Governor then—went with Henry Villard and his party to drive the golden (last) spike in the Northern Pacific railway. The settlers were holding a large thrashing "bee" near the scene of the golden spike ceremonies, to which the visitors were ultimately drawn. The Governor stripped off his broadcloth and began to put through the "No. 1 Hard" more rapidly and scientifically than the best professional feeder in the crowd, as much to the amusement of the distinguished party as the astonishment of the natives. Besides being able to milk cows, break, and drive oxen, and teach a pig-headed calf to drink, he is a magnificent horse-back rider and an enthusiastic expert with a coach and four. He loves his children and his horses and never goes back on his friends.

While he was Governor of Wisconsin he accomplished more of practical value to the agricultural interests than all of his predecessors combined. Amid the general ridicule and carping of that time, he stood manfully by Magnus Swenson's earliest experiments with amber cane sirup, out of which grew more specific knowledge and valuable machinery han the country had theretofore possessed. Indeed, so anxious was he to see Professor Swenson succeed, that when the experimental boilers and machinery reached Madison he mounted one of the loaded wagons and rode to the State Farm and there helped to locate the plant and begin active operations.

Governor Rusk was one of the earliest friends of the Wisconsin Farmers' Institutes. He always recommended and helped to secure liberal appropriations for them, watched and helped to guide their management and actively participated in many of their sessions. In fact, not only were these institutes, now so popular and effective in Wisconsin as educators, conceived and brought to fruition during his incumbency of the gubernatorial chair, and by his help, but the valuable improvements at the State Farm and Agricultural Experiment Station, the enlarged appropriations to the Dairymen's, Sheep-breeders', Horticultural and other Associations of that kind were recommended by him as well as the office of State Veterinarian, with power to control and condemn diseased horses and cattle and to preserve the general health of domestic animals.

The new Secretary is essentially a man of ideas, of action, of insight, and of executive ability. While performing his duties and carrying out his plans with promptness, he never falls into serious mistakes. His judgment of men and his power to anticipate results are as remarkable as his independence of thought and general breadth of policy. He is always practical, always patriotic and public-spirited, always generous and humane, always looking into and building for the future, always studying and ministering to the needs of the people. And in his new position, if he shall not be too much hampered by musty old statutes and red-tape regulations, he will be as popular with and as useful to the people of the nation as he has for years been to those of his own State, Wisconsin, who think there is nobody in the world like "Uncle Jerry Rusk."

JEREMIAH McLAIN RUSK,
Secretary of Agriculture. From a Photograph. Fig. 77.

The Poultry Yard.

POULTRY NOTES.

PROFIT IN FARM POULTRY.—I think Mr. Bucephalus Brown is away off in regard to the price of eggs this winter. Here (Dayton, O.) the price of eggs was highest at Thanksgiving. Two weeks later they began to drop from 25 cents until in the fore part of February they were retailing at 12 cents per dozen. I got 15 cents all last summer. I credit the high prices of last summer to the packers (cold storage and otherwise) who gathered large stocks and had to unload them in an open, warm winter's market; hence the low prices. They are selling at 14 cents. I predict that they will go still higher.

NEW BLACK JAVAS.—I have five Rose-Combed Black Java hens that now are laying an average of four eggs per day, and this too in the coldest weather this winter; four degrees above zero. I have never heard of any Black Javas with rose-combs but mine. I have had hens to weigh in laying condition nine pounds and six ounces. The largest Plymouth Rock hen I ever saw weighed eight pounds five ounces. "W."

The Red-Caps for their size lay a large egg. It is nearly white and eight eggs weigh one and one-sixteenth pound. The only objection to them is their heavy combs.

SILOS AND ENSILAGE.

CORN AS A STOCK FOOD.

HENRY STEWART.

It is the misuse rather than the use of corn which is objectionable in feeding stock. When fed in reasonable quantities it is a healthful and nutritious food. Its composition is such that it is of itself a healthful food when fed in moderation, and a food well adapted for a working animal or one that is fed for fat. It contains of

Digestible albuminoids	8.4 per cent.
Carbohydrates	60.6 "
Fats	4 8 "

giving a nutritive ratio of 1 to 8.6 and affording an excess of about 50 per cent. of carbonaceous matters above the normal maintenance ratio. Thus for fattening animals it is just about what is required, and for working animals it affords a large supply of sustenance for respiration and the production of heat.

These figures are taken from the German tables, which somehow reduce the actual nitrogenous matter (albuminoids) about one-fifth, or from 10 to 8.4 of digestible matters. In practice I don't think this is consistent with facts, for a large number of animals are fed wholly upon corn for the grain food, with very poor hay or blade fodder, which is as poor as the poor hay of the South, and yet the horses, mules and cattle are extremely healthy and do an enormous quantity of hard work. Falling into the custom of the people since I have been in the South, I have fed a large quantity of corn to working oxen, horses and beeves, and have found it in every way a desirable grain food. I think the past season my colts have made more growth upon wheat bran than they had previously done upon corn; but corn is very much cheaper and more easily procured in many places than bran.

It has been claimed, and I think with justice that excessive feeding of corn to hogs is productive of disease. But then excessive fatness is a disease, and I have been sometimes obliged to kill pigs to prevent them from dying of excessive fatness, especially those belonging to the small white breed which become fat at a very early age, so that it is the case that corn is really too effective a food for fattening, and this has been very clearly shown by the experiments made by Professors Henry and Sanborn. The animals fed upon corn were largely defective in the development of the most important vital organs, and consequently were fated to die early from disease if not quickly slaughtered. Poorly developed heart, liver, kidneys, and spleen, are incompatible with robust health, and cannot fail to provoke fatal disease or encourage its development on the first attack by contagion, which might be resisted by a better developed vital system. Thus I think it is a well established fact that too long-continued corn-feeding must result in disease, and this applies to all animals except those that are hard worked or exposed to cold, by which a large consumption of carbon in the system is made necessary.

No doubt there is a great temptation to use corn when four pounds of it will make a pound of live weight of pork, and no harm will happen if the feeding is practiced with young animals and only up to a safe point, but this very character of this grain makes it necessary to exercise caution and keep within bounds, or to feed with it more nitrogenous foods. The best of these theoretically are skimmed milk and cotton-seed meal (decorticated). These have the following composition:

Digestible.	Skimmed milk.	Cotton meal.
Albuminoids	3 5	33 20
Carbohydrates	5.0	17.6
Fat	0.5	16.2
Ratio	.9	1 to 1.8

The nutritive ratios of these foods are practically the same; but their effect upon the digestive organs may be very different, and hence in practice some allowance must be made. As regards cotton-seed meal this objection prevails to so large an extent as to wholly prohibit its use for feeding any stock except cows and fattening cattle; but for these a mixture of this meal with corn-meal is a most excellent food, and to make a desirable ration four pounds of corn-meal and one pound of cotton-seed meal might be mixed; the ration would have the following nutritive ratio:

4 Equivalents.	Albuminoids.	Carbohydrates.	Fat.
of corn-meal	33.6	242.4	19.2
1 of cotton-seed meal,	33.2	17 6	16.2
	66.8	260.	35.4
average	13 3	52	7.1

Giving a ratio of 1 to 5.

But the large quantity of digestible fat and the quiet in which fattening animals are kept, assuming that some of the albuminoids are disposed of in the production of fat, would make this mixture an excellent one both for dairy cows and fattening cattle.

Another popular mixture both in the dairy and for fattening beeves is corn-meal and bran. These substances are not far apart in nutritive character; as bran contains of digestible

Albuminoids	.10	per cent.
Carbohydrates,	48.5	" "
Fat	3 1	" "
with a nutritive ratio of	1 to 5.6	

Then equal parts of bran and corn-meal would have a ratio of one of albuminoids to seven of carbohydrates, but while the latter are in excess, not so large a proportion of them is in the form of actual fat, and the favorable action of bran on the digestive organs renders this mixture rather better than that with cotton-seed meal (which has a costive effect upon the bowels) and altogether better for horses.

Lastly, for feeding swine or calves the mixture of corn-meal and skimmed milk in the proportion of 10 of milk to two of corn, will be found very appropriate and useful. The nutritive ratio of this food is one to five, an excellent one for young growing animals, and one that makes the very best pork for domestic use. I have fed pigs for many years on this kind of mixed food and had them fit for market at any day from an age of four months up to 10 or 12, and without carrying them over the winter, excepting those that are farrowed late in the fall or early in the winter and which are kept over the first winter at very little cost.

On the whole, corn is the most valuable feeding grain we have. If used with intelligent discretion, it is a safe food alone; but when mixed with other foods it may be made more profitable under a wide range of possibilities.

"PATENT SILAGE" AGAIN.

Our readers know that we have several times referred to the "patent silage" prepared by means of the silo governor—an invention of Mr. S. M. Colcord, of Massachusetts. We have long believed that this process of preparing silage will, some day, revolutionize the ensilage business, enable siloists to prepare a more generally uniform article, and make baled silage almost as important a product as baled hay.

The early frosts of last fall cut many a corn-field that would have been almost a total loss but for the silo. On page 832 of last year's volume of the Rural, Prof. Storer gave an excellent account of the action of frost upon corn fodder. He suggested that frosted corn fodder might be saved from harm by putting it into the silo while still frozen. There were many who objected to this, and some have reported partial failures with silage from the frozen stalks. The following letter from Mr. Colcord will be read with interest by those who mean to farm with such skill and judgment that they may not be beaten by the frost

"The best preserved samples of corn forage that I have yet seen were made from the poorest corn fodder I ever raised, which was very badly frost-bitten early in September. I send you herewith a sample of silage together with a bottle of juice drawn from the bottom of the silo at the center, after I had drained off two gallons to wash out the pipes. This juice is free from acid, and has been so all the time it has been in the silo, and I presume it will remain so when you get it. The real odor and taste of it you may get by leaving the cork out of the bottle 24 hours or longer. There is not a particle of waste in the silo or at the feeding trough. The cattle are each eating 60 pounds daily and would eat 75 if they could get it, and are gaining very fast upon it, and yet the corn looked so bad in the field that a neighbor told me that if I would give it to him he would not harvest it, though it was a great deal better than his, and better than an average of all raised around here.

Now the point is, if the silo will save a crop like this, corn is the surest crop to raise for cattle, as well as the best and most economical. My silo is now arranged so that I get any pressure I want at any time, the juice can be made to run from the bottom like cider from a cider-mill. This gives me uniform pressure, consistence and moisture throughout, and I am able to get the conditions for capillary attraction to work perfectly, so that I can wring out the juice from the silage with one hand from any part of the silo. There is no heat or fermentation in the silo and no silage odor in the barn, the silo, or on the hands or clothing. I take the temperature, measure the juice, and weigh every ration given to the cattle daily, and I weigh all the cattle every 30 days. All things are arranged to do it with less loss of time and less trouble and labor than by any other method, with better results, greater economy and greater assurance of success."

The R. N.-Y. can only say that the sample of silage was in perfect condition—sweet and fragrant. The Experiment Stations should test this patent system of silage-making side by side with the ordinary silo. The R. N.-Y. is of the opinion that the difference in the quality of the product will surprise the experimenters.

IMPROVING SEED CORN.

A. C. GLIDDEN.

This has always been a favorite project with farmers and seedsmen. The facility with which changes in its character can be made, has fostered the plausible theory that an ideal corn could be produced, that would become universally popular, and suited to the wants of all sections. Some have honestly, no doubt, thought this ideal corn had been found and have disseminated what they believed to be it through advertising agencies, in the expectation that it would sustain its local popularity wherever planted; but the history of every such enterprise is that, except in similar climate and latitude, the variety has proved a failure, and been condemned as a fraud. The Leaming corn is a case in point. That came to the front with a brass-band accompaniment. Michigan farmers invested largely in it, but it was never planted a second time. The long ear and kernel of the original samples, became here a short ear with a big butt, something of the form of a pine-apple, having much shorter kernels than the seed planted. It is quite possible to improve the local varieties into the ideal corn for each locality, but length of season, degrees of humidity and of temperature, work greater changes than is possible by manipulation by the hand of man. Corn brought from the south and carried only a degree of latitude toward the north, is about 10 days later, grows taller, and has a greater spread of leaf; but grow this corn continuously, planting every year from the last year's crop, and it will in a few years approximate to the native kinds. It is quite as likely to be less valuable on account of some peculiarity of ear or stalk than the old tried sorts that have become native, or suited, by long cultivation, to the environment.

The Hathaway dent, for instance, seems best suited for the four counties of Michigan bordering on the Indiana line; but as we go east to the three bordering on Ohio it loses its popularity, and regains it further south in Ohio, following isothermal lines. This variety was sent by Mr. Hathaway to the Michigan Agricultural College, several years ago, for trial there. Lansing is 70 miles north, and the same distance east from the home of Mr. Hathaway in Cass county. The corn was planted continuously for several years, and became at last quite desirable for that locality. The seed was lost a year ago, and they sent to Mr. Hathaway for a fresh supply, and this proved another failure at the college last year, when compared with the home-grown kinds. It was several days later, and not like the corn bred by them from the first sample seed. This had become indigenous, as it were, or adapted to the soil and climate.

I attended the Grayling institute this winter, 80 miles north from Lansing. To illustrate his subject, one local essayist had samples of corn which had proved best adapted to that locality. It was an eight-rowed flint variety, with short ears, but was early enough to ripen before frost. He had tried the Dutton, but while that was his ideal corn, the season was not quite long enough for its perfect maturity. The tendency there, he said, was toward a shorter ear and kernel, and he conceived the idea that if the native variety and the Dutton were taken to the college farm, and mixed together and planted about three years, there would come a resultant variety especially adapted to the Grayling climate. He thought the Dutton would gain in earliness by the hybridization, and the native corn becomes patterned after the Dutton in length of ear and kernel, and that these traits would become fixed in its growth and that they could be transferred to another locality where they would become permanent. Here is just where the breeding of plants and animals differs. When the former are transferred from native to alien soil and climate, a constant evolution is going on suiting them to the changed conditions. Seeds of Lucerne coming direct from Germany and planted here furnish plants that will not stand our winters, but the evolution going on in the plant from Germany to Chili, and thence up the Pacific coast, and across the mountains to the table-lands of Colorado, has transformed the tender Lucerne to the hardy Alfalfa.

I believe corn has no characteristic of value, that will bear transportation across one degree of latitude and remain. I think it more vacillating and changeable than any other of our grain crops. There is a vast deal in selection from each individual crop for seed for the next crop on the same farm. I have the same variety I have planted for 20 years on the same farm. It was originally what was then called the large yellow dent and came from further south. At first the stalks grew 14 feet tall and the ears were breast-high on the stalks. It gradually moderated its extreme height and set ears nearer the ground. By selection I have secured ears of more uniform diameter from end to end, and the corn is more plentiful and less indented. It formerly had red and white cobs mixed; now, the cobs are all red. I have tried new sorts occasionally alongside of it; but have never seen any quality in the new that induced me to change. A well grown ear—one that has had a chance to grow to its normal size—will assume the type of the ideal seed ear, while a starved plant coming from a kernel off the same ear as the first, will generate a nubbin, "no good" for seed.

The efforts of seedsmen to breed a type of field corn that shall prove valuable when widely distributed is futile. There is a more universal opportunity for effective enterprise. Every farm should be an experiment station to improve the native sort. This duty cannot be delegated to some person over the line in another county even, but must be an individual enterprise for individual use. To grow good seed corn, plant fewer kernels to the hill, and do everything on your part which nature seems to demand, and leave the breeding to the forces of nature, that always act consistently with the surroundings.

Van Buren Co., Michigan.

PROF. G. E. MORROW.

There are many excellent varieties of corn. I have not thought the production of new varieties especially important—especially for farmers generally. Neither have I thought change of seed necessarily desirable. I have steadily advised farmers to keep tested and well-liked varieties as pure as possible, trying new claimants to favor on a small scale. The plan of having a small plot especially for seed corn is a good one. If not convenient to have it separate from the regular fields, specially selected seed may be planted at one side or in one corner. Cutting the tassels from, or entirely removing undesirable stalks would tend to improvement—reducing the percentage of barren stalks, for instance.

Unless replanting is necessary, I would not favor planting at different times or planting different varieties in order to keep up the supply of pollen. Sometimes good results would doubtless be secured, but, I doubt if much gain will usually result. This opinion is not based on personal experience.

Purposed or accidental cross-fertilization of varieties sometimes gives very satisfactory results; but I have some prejudice in favor of keeping varieties pure in all ordinary cases. Selecting a good variety—good in its adapta-

tion to the locality—and then careful and persistent selection of seed with reference to its having all the qualities desired—hence selection from the stalk rather than from the crib—and giving the crop the best possible "conditions of life" in the way of soil and cultivation, I believe the most practicable means by which to improve corn by most farmers.

Ordinarily, on any but an experimental farm, I think I should cultivate but two varieties of field corn, and those alike in color and general type; one being an early-ripening variety; the other a medium-late variety, but usually larger in stalk and ear and yielding a few bushels more per acre than the early variety, to which about one-fourth of the total acreage in corn would be planted, for early autumn feeding. Such a variety we also find valuable when unusually late planting is necessary from any cause.

University of Illinois, Champaign.

ENSILAGE NOTES.

TWO QUESTIONS ANSWERED.

G. S. N., Middleburgh, Pa.—I wish to try an acre of ensilage or maybe two, and do not wish to go to a great expense. How can I construct a cheap silo? I have plenty of room at one end of my barn and I have a stable for which there is no particular use—bank barn. Could I construct a silo in there by running it up into the mow—say 15 or 18 feet—and lining it with heavy paper. On two sides there is a stone wall eight feet high. I suppose the silo must be air-tight; above it (the mow) joins the barn floor and I could cut the corn-stalks right into the pit without any trouble. I would prefer to grow roots, but my land is not adapted for this crop, while corn or clover can grow. Must the silage be packed very tight, and must the silo be filled right along without stopping? How large should the silo be for 12 to 20 tons from an acre? At what stage of growth should the corn be cut? Dry corn fodder is a poor feed for milk, and on one or two acres I could grow as much as I need.

ANSWERED BY JOHN GOULD, OHIO.

YES, you can construct a silo admirably in the stable of the bank barn. Put on false girts so as to bring them out flush with the inside edge of the silo. Set up 16-feet-long studding, letting them go down *inside* of the wall, but resting against it. Set them 16 inches apart: 2x4 inch stuff will be heavy enough Line this up with cheap inch pine or hemlock lumber. Paper this with ordinary tarred paper, then put on another layer of cheap lumber over this paper, and nail the two boards and paper strongly to the studding. This arrangement avoids all bother and failure in making an air-tight joint between the wood and stone and makes an air space, not only between the wall but the barn, and is all the protection that a silo needs from cold weather. When the silo is complete, paint it thoroughly on the inside with gas-tar and resin, using about three or four pounds to the gallon. Melt it over a slow fire, and apply boiling-hot. This makes an air-and-moisture-proof wall. It would be well to paint the lower end of the studding with the same "drop" before setting up.

This is the cheapest silo yet built that is both durable, and superior to a stone wall for keeping silage. Ensilage has now become so established that for cows or sheep one cannot afford to raise roots. Prof. Sanborn's figures on my silage crop make silage cost about half as much to raise and pit as roots; and he makes it worth over three times as much to feed stock.

The silo can be filled fast or slow, as the farmer may be situated. The corn for the silo should be allowed to become mature—commencing to pass out of the milk stage—before silo filling should commence. If you plant the Virginia corn (and I doubt if you can afford to plant any other), plant early and do not use over eight quarts per acre, and do not root-prune it—cultivate as shallow as possible. You can easily put an acre—20 tons of silage—in a box 10 feet square; but don't build a silo so small! Build one 12x12 and 16 feet deep at least, and keep stock enough to eat what it will hold—say 50 tons, which 10 cows will eat in 20 weeks, or longer, if some dry feed should be given along with the silage corn.

Packing silage very closely in the pits when filling is not as popular now as it once was. Tramp as little as possible when filling, but when it gets *hot*, then tramp along the walls and sides. When the silo is filled, do not cover it at once. Let it remain uncovered four or five days to allow the silage to settle, heat, and throw out the air. Then you can cover it, or not, as you choose. In any event, do not put on more than a foot of straw tramped down, and a few old boards to hold it in place. If no cover at all is put on, little damage will be done—not more than three inches will mold, and the molded layer of itself makes an air-proof cover; so, taking time, labor and material into account, I doubt if so cheap a cover can be used as no cover at all.

F. M., Springford, Ontario, Canada.—I wish to build a silo; would it be advisable to build it of brick and stone, as I have these and wood is scarce? If I have not enough brick and stone to build it, could I finish the walls with wood? If so, how could the wood be joined on the brick and stone so that the silo will be air-tight? Would it be advisable to build it partially underground, the soil being sandy? What kind of a floor would it need? Would it be necessary to plaster inside of the brick, and how? Which is the better for ensilage corn—Mammoth Southern sweet or our common northern field corn, letting the field corn stand till in the glazing state?

ANSWERED BY JOHN GOULD.

Judging from what I saw and heard during my recent trip to Canada, I doubt if you can profitably build either a stone or brick silo. Lumber is not so scarce that you cannot get good fair pine or hemlock for about $12 per 1,000 feet and the silo if built in the barn, need not cost more than $75, all told. You can, however, make the walls of brick or stone, but I would line them with wood inside: even then, in your cold climate, the frost would go through stone or brick again and again, and more or less damage would be done to the silage by repeated freezings and thawings along the walls, and this is almost wholly avoided by the use of wooden walls and an air-space. I think that a silo built of wood, the studding set 16 inches apart, lined upon the inside with two thicknesses of inch lumber, with tarred paper between, and covered on the outside with ordinary matched, or "drop" siding, will make the best and cheapest silo. Gas-tar and resin melted together and applied to the inside, boiling hot, will make the silo wholly durable. It is hard work to so join brick and stone with wood that, in the end, your silo will not practically amount to a wooden one; for from the wooden superstructure you will need to run "spurs" down the inside of the wall to the ground, and start the "lining" from the bottom; else the lateral pressure will start the wooden addition off from the wall, and under it more or less air will enter, that will be fatal to more or less silage. Make all the silo either of wood or stone. The uniting of the two usually ends in a sort of a "new-wine-in-old-bottles" affair,

There is no advantage in building a silo partially underground. It only involves extra labor and expense, for which no one gets pay. The silage doesn't keep any better by using a cellar silo. The man who has a silo below ground, and has to elevate the silage to the cattle, will soon find that it is far better to let the carrier of the cutter put the silage high enough at the start, by having the bottom of the silo as high as the feeding floor. The silos built on the surface of the ground, or built in the barn, starting from the basement or ground floor, are now most popular.

A silo does not need any floor beyond the natural soil, well pounded down. It may be dug out from the center a few inches, and the surplus dirt may be thrown up around the inside walls so as to make the bottom somewhat concave. This is superior to stone, grout, or a cement bottom. A half inch of straw may be thrown over the bottom, but this is wholly unnecessary. If the silo is built of brick or stone, you will need to plaster it, and make a very smooth face, or else the silage will bind against the rough walls and "drag," and not settle properly. This cement plaster should be the best. The walls may be laid up with a rough face to which the plaster will cling and harden.

Possibly in Canada you might find that your own best, most rank-growing kinds of field corn might be best. I think if you will plant "B & W" Southern corn thin—about eight quarts per acre—early, if you can "chance it" until September 20, you will have little difficulty in getting a large yield of good silage from it; but you will not go wrong with your own kinds, only you may fail in getting so large a crop. Let the crop, whatever the kind of corn it may be, get mature, passing out of the milk stage; then fill the silo.

A good many lath and plaster a silo using what is known as bevel lath put on a little bias so as to have the lath cross the cracks of the sheeting or inside lining boards. The cement plaster is made very strong, and given a smooth finish. In the event of the cement proving poor, it makes a bad job, and I doubt if the plastered silo will, in the end, prove superior to one double-boarded and painted with hot asphalt, or gas-tar and resin.

POTATO GROWING IN WISCONSIN.

PROFESSOR E. S. GOFF.

Profits from a poor soil; culture; varieties; insecticides; digging; storage; marketing.

WAUSHARA and Marquette Counties in Central Wisconsin offer a striking illustration of what may sometimes be accomplished upon a poor soil by growing a special crop that is adapted to it. The soil of these counties consists largely of a poor, yellow sand, of little value for ordinary mixed farming. By the help of the fertility furnished by clover, however, it yields good crops of potatoes of superior quality, and these two counties are becoming famous in the Northwest as the home of this most important article of food. It is not very uncommon to find a grower who raises 100 acres of potatoes in a single season, though it must be confessed that the largest net profits have not generally come from these extravagantly large plantations. During a recent visit to this region, I had an opportunity of learning something of the methods of culture practiced there, and thinking the information may have some interest to RURAL readers, I send an abstract of it.

The potatoes are generally grown upon clover sod. After having been well plowed, the ground is marked one way with an ordinary corn-marker, and the other way with the riding cultivator having its shares arranged to form a furrow four to six inches deep. The hills are spaced three to three-and-a-half feet apart both ways. A single two-eye cutting from a tuber of medium size is dropped in each hill, when the row is covered with the cultivator. It is thought necessary to plant at least four inches deep A few growers prefer to use whole potatoes of small to medium size, but the majority appeared to favor the two-eye cuttings. After the planting, the smoothing harrow is started, and its use is continued at intervals until the tops are two to three inches high. The Colorado beetle is destroyed with Paris-green either mixed with land plaster, or suspended in water. Many growers think that the fertilizing value of the plaster is sufficient to repay its cost. Machines for applying the Paris-green mixtures are being tested, but have not as yet come much into use.

The crop is dug exclusively by hand, the potato digger not having yet been tried to any considerable extent. In the light, sandy soil, the cost of digging by hand is not great, and some growers regard the picking up as a more serious matter than the digging. The varieties most grown appeared to be White Star and Early and Late Beauty of Hebron. The Empire State is being tested, and seems to be generally satisfactory. But few sorts are grown, as the market calls for but three or four standard varieties. The crop is quite largely purchased by local buyers who store the potatoes in elevators at the railway stations. I visited one of these elevators which was said to contain 20,000 bushels. It was a long, rather narrow building, only one story high, but with a cellar extending under the whole. The potatoes were stored in huge bins reaching nearly to the ceiling and occupying the entire floors, with the exception of a narrow walk next to the outside.

The building was built with double walls, and the potatoes were kept from freezing by stoves. Potatoes are shipped from these elevators to Milwaukee and Chicago, the principal markets for this region, during moderate weather throughout the winter. The production of potatoes in these counties appears to be rapidly increasing. It would probably increase faster than it does, but for the fact that potatoes being a very bulky crop, can be profitably grown only within a few miles of a railway station. The price at present rules low—from 18 to 20 cents per bushel—but it is claimed that at these figures the crop is fairly profitable. The price occasionally rises to 50 and even 75 cents per bushel, and then the crop proves highly remunerative. About 200 bushels to the acre are considered a good yield, and the net profit from such a crop when sold at a fair price is often sufficient to pay for the land that produced it.

Rural Topics.

LIST OF HORTICULTURISTS AT THE EXPERIMENT STATIONS.

THE Committee appointed by the recent convention of Agricultural Colleges and Experiment Stations, held at Knoxville, Tenn., to further co-operative work in horticulture, have as yet been unable to get the list of the Horticulturists of the stations completed, and have, also, not been able to learn the line of work which the different Stations intend to pursue; but as there is a strong desire on the part of many originators and growers of specialties in horticulture to enter into correspondence with the Stations concerning the testing of new fruits and vegetables, the committee have decided to publish this incomplete list of those having the horticultural work in charge at the several Stations mentioned below:

Alabama, Auburn, P. H. Well, M. E., Ph. D, Horticulturist and Meteorologist.

Arkansas, Fayetteville, E. S. Richman, B. S., Horticulturist.

Colorado, Fort Collins, James Cassidy, P.S., Botanist and Horticulturist.

Delaware, Newark, M. H Beckwith, Horticulturist and Entomologist.

Illinois, Champaign, T. J. Burrill, Ph.D., Horticulturist and Botanist.

Indiana, Lafayette, James Troop, M. S., Horticulturist.

Iowa, Ames, J. L. Budd, M.H., Horticulturist.

Kansas, Manhattan, Edward A. Popenoe, A.M., Horticulturist.

Kentucky, Lexington, A. R. Crandall, Ph. D., Botanist.

Maine, Irons, F. L Harvey, M.S., Botanist and Entomologist.

Maryland, Agricultural College P. O., William H. Bishop, B. S., Horticulturist.

Massachusetts, Amherst, Samuel T. Maynard, B. Sc., Horticulturist.

Michigan. Agricultural College, L. R Taft, M. S, Horticulturist.

Minnesota, St. Anthony Park, Samuel B. Green, B. S., Horticulturist.

Mississippi, Agricultural College, A. B. McKay, B S., Horticulturist

Missouri, Columbia, J. W. Clark, B. S., Horticulturist and Entomologist.

Nebraska, Lincoln, Charles E. Bessey, Ph. D., Director and Botanist.

Nevada, Reno, Walter McNab Miller, B. S., Botanist.

New York, Ithaca, Liberty H. Baily, M. S., Horticulturist.

New York, Geneva, Emmett S. Goff, Horticulturist.

New Jersey, New Brunswick, Byron D. Halsted, Sc. D., Horticulturist.

North Carolina, Raleigh, Gerald McCarthy, B. Sc., Botanist.

Oregon, Corvallis, E. R. Lake, M. S., Botanist and Horticulturist.

Ohio, Columbus, William Green, Horticulturist.

Pennsylvania, State College, Centre County, George C. Butz, M. S., Horticulturist.

South Carolina, Columbia, G T. Atkinson, Ph. D., Botanist and Entomologist.

Tennessee, Knoxville, T. Lamson Scribner, B. S., Botanist and Horticulturist.

Texas, College Station, T. L. Brunk, B. Sc., Horticulturist.

Vermont, Burlington, C W. Minott, B. Agr., Horticulturist.

Virginia, Blacksburg, Wm. B. Alwood, Botanist and Entomologist.

MYSTERY OF THE SEED TRADE.

NO. II.

Multiplication of varieties:—by giving new names to old or undeserving new kinds; by introduction of the same sorts by different seedsmen under different names; by tacking on special names to European varieties; by reviving by-gone kinds under new names; catalogues to be cut down one-half with profit to seedsman and customer; choice kinds of peas, tomatoes; fraudulent deception; a matter worthy of grave consideration.

To the criticisms of seedsmen in a former article, may be added one on their multiplication of varieties. This is done in two ways—by giving a new name to a variety already named, or by naming one that by reason of its slight variation from a well known kind is undeserving of it. Take peas, for example. The R. N.-Y. has often remarked that many so-called varieties were one and the same. This applies particularly to the extra early white peas that have almost as many names as there are prominent seedsmen. The difference, in the whole, is no greater than must be under a close or careless selection of seed stock. Numerous tests by the writer have convinced him of this. The moment one seedsman puts out a new sort, others follow suit; that is, they put out a pea just like the newcomer under another name. This is illustrated in the Alaska. The year after its introduction numerous other extra-early blue peas appeared, all equal if not superior to it! It was said by them to be nothing but the

Kentish Invicta; still they had names for their introductions besides Kentish Invicta.

Sometimes the same thing is introduced simultaneously by two seedsmen, as the Mikado and Turner's Hybrid tomato, and the Chartier and Mammoth Long Rose radish. If these are not identical, they are so nearly alike that it is to be regretted that they came out under different names.

In introducing new vegetables from Europe it is very common for the dealer to tack on a name of his own, the consequence of which is that there will be two or three names to the same thing.

Then a slight variation even if an improvement, does not justify a new name. There are cases where a sort has been dropped for some years and then appeared under another name. I think the Green-and-Gold watermelon is a case of this kind. Thirty years ago the writer grew a melon that answers the description of this sort, even to its granular flesh, and this melon was the leading market melon of the vicinity. It was superseded by red-fleshed melons and it is doubtful whether a seed of it can be found there now. It went then under the name of Yellow Mountain Sprout. This is not meant to antagonize the Green-and-Gold which is a very good melon, large and early.

It seems to me that a seedsman who would cut down his catalogue one-half, putting in his list only the best sorts of each vegetable, and never adding a new sort until it has been thoroughly proved that it is a real improvement, could establish a business. It would perhaps tax him at first for a year or two; but this course would bring unusual confidence, and he would retain his old customers and add new ones. See what a cutting down could be made with profit. Many catalogues have from 40 to 50 varieties of peas. Take for extra-early one white and one blue sort, the Advancer for an early wrinkled sort, the American Wonder and Little Gem for dwarfs, and for later, Stratagem and Champion of England; in all, seven varieties. How many more need be added to this list? Say three more of your choice and make an even ten—that would be better for the seller and the buyer too, for the latter would not fail to have the best of the lot. Take the tomato, of which 30 or 40 sorts are catalogued. A half dozen of the best should fill all wants. For a purple sort, Acme or Essex Hybrid, about the same thing; for a scarlet, Perfection; the Mikado for size and productiveness; the Optimus as a combination of good qualities, and that new bush variety, the Dwarf Champion. These would be my choice. The remainder are not so good or at least no better. Why cumber the books and drawers with them?

There are cases without doubt where actual deception has been practiced by palming off an old variety for a new one. Not long since a case was told me of an Eastern dealer who advertised a new sort of potato. I can name it, but perhaps it would be better not to do so. It was described as much earlier and better than the Early Rose. His scheme was successful; many orders came in and his profits went up into the thousands. Many of his customers reported splendid crops, finer and earlier than Early Rose. All the same, he had filled his order from Early Rose potatoes bought from the commission merchant around the corner. How about the indorsement of his customers? That is easily explained—they had given them better soil and culture than usual. This, as the fable writer says, teaches two lessons—that there are tricks in all trades, and that a common sort by good culture may appear so good as to be thought new.

This is really an important matter concerning both buyer and seller, as already intimated. Of course, these lists must vary somewhat from one section to another, and some sorts that should be obsolete would still be called for; but in time the relative values of varieties could be established by honest representations, and then our catalogues would be reduced to at least half their present size.

ANON.

CORN FAILURE.—On land seemingly well prepared for corn, and on which it comes up well, looking green and even rank, it not infrequently fails to ear well; or if many ears are set, they are short, or the tips, even for several inches, are bare of grain. This has been my own experience once or twice; and subsequent experience has shown me the probability of what seemed to be taught by Prof. Atwater's Connecticut experiments, that corn requires (at least on our light soils) potash and phosphoric acid much more than nitrogen. If there is any crop that is better grown with chemicals than with dung, corn is the one. It "looks good" to see the corn have a very dark green shade, such as rich dung or nitrogen salts will give it; but when harvest comes, a field that is almost yellow by contrast will often show a much better earing. VARIETIES, TOOLS, MANURES, CULTURE.

QUESTIONS.

1. *What variety of field corn do you prefer? Why?*
2. *How much shelled corn will it give per acre?*
3. *How far apart do you plant?*
4. *What manures give you the best results for corn? Give a list of the tools you use in its cultivation.*

ANSWERS FROM FARMERS.

RURAL SPECIAL REPORTS.

Canada.

WILSONVILLE, Ont.—1. Having tried the three varieties commonly grown around here—namely the common yellow, King Philip and Red Glaze—I have fallen back on the last variety because it matures a week or ten days earlier than the others. It is also a heavier cropper, the ears being longer on an average. 2. As far as the crop of 1888 is concerned, I am not able to tell the amount of shelled corn per acre; of corn in the ear, from 4½ acres I harvested 550 bushels of sound, hard corn and about 75 bushels of inferior. The crop of '87 averaged 50 bushels of shelled corn to the acre. 3. I plant in hills three feet 10 inches apart each way. 4. No manure is better for corn than well rotted barn-yard manure plowed under. After the corn is up I top-dress in the hill with plaster, hen manure and unleached wood ashes. After the corn is up I use no tool but the Champion one-horse cultivator and hoe. I usually fall-plow my corn ground, cultivate frequently in the spring about the middle of May. I draw on manure at the rate of 15 loads to the acre and plow about six inches deep. I plant from May 20 to 24. After the corn is up I cultivate twice before hoeing. When hoeing I thin the corn to four plants in a hill. After this I cultivate once a week until the corn is too large. H. F.

BOX GROVE, Ontario.—In this part of Canada we don't depend much on corn. I live about 20 miles north of Toronto. Some farmers don't grow any and others only one or two acres. I have for a few years past been growing Compton's Yellow and have found it as early as any we have had in this locality. I have not been particular to learn the quantity raised per acre. One of the neighbors had a field put in on shares, on which the measured yield was 120 bushels per acre. We plant about three feet apart. We use no fertilizer but barn-yard manure. The Planet Jr. cultivator and other tools of similar construction are mostly used for cultivating the soil.

G. F.

BRAMPTON, Ont.—1. White flint, because it ripens evenly and is a good yielder. 2. I can't answer. We don't grow much of it. 3. Three feet each way in the rows. 4. Hog manure well worked into the soil. The plow scuffler and hoe, working the scuffler both ways in the row. Red-cob corn is used for ensilage.

J. K.

RENFREW, Ont.—We are too far north to make the growing of corn a success as a field crop. Only the early varieties, such as Compton's Early, can be grown successfully.

A. A. W.

CHIPAWA, Ont.—1. On my soil (a clay loam), I prefer eight-rowed yellow corn or Red Glazed, because they are hardy, early, and productive. 2. Yield per acre, 35, 40 or 50 bushels. 3. We plant three feet six inches each way. 4. Cow manure of a good quality we find best. We use about 15 good square loads per acre, and a liberal sprinkling of wood ashes on top of the hill after planting. Before planting, we put the land in a complete state of fallow, and if the weeds come in abundance with the corn, we give it a dressing with a light harrow. If the land becomes packed with heavy rains, we break the center of the rows with a two-horse cultivator, removing such blades as are unnecessary, to avoid injuring the young corn. We use the Cock Shull Cultivator. We cultivate at least six times—the oftener the better. The last dressing is with a shovel plow. Some parts of the township are excellent for corn and two or three of the farmers tried Western corn, but the location must be favorable, or it will not ripen perfectly. The crop of 1888 was excellent, and the average yield per acre was about 100 bushels of ears. G. G.

Colorado.

STEAMBOAT SPRINGS, Routt County.—Corn is not a product of this country. We are west of the Rocky Mountain range—altitude 6,500 feet. The nights are too cool and the seasons too short. For such small grains as wheat and oats, our climate is good. I am about 14 miles from the summit of the range.

L. D. C.

PARKER, Douglass County.—1. I plant a yellow dent, as it suckers abundantly, making a large amount of nice fodder. Moreover, it matures early and shells with much ease. 2. In this dry country without irrigation I raised, last season, a little over 30 bushels to the acre on a piece of 11 acres which had been planted to corn 22 years without any manure until last year, when I spread on a little over 200 loads of barn-yard manure and plowed it in. The season being very dry, I think the result not as good as it would have been if it had been more moist. I used only barnyard manure. 3. I planted my corn three feet 10 inches apart both ways. 4. I used a one-horse cultivator and gave perfectly flat culture. I would not use anything else in corn or potatoes. J. W.

Connecticut.

CORNWALL, Litchfield County.—1. Golden Dew Drop for earliness and small-cob for meal; Tuscarora for feeding without grinding, as it is not flinty, and poultry, horses and cattle prefer it to any other. 2. Sixty to 75 bushels. The crop has been blown down badly for two years, which lessened the yield one-third or more. 3. Three and one-half feet. 4. Barn-yard supplemented with commercial fertilizers. Acme harrow and cultivator. C. P. S.

NORTHFIELD, Litchfield County.—1. I prefer a kind that my father before me used. It is almost exactly like the Pond corn in all respects. I prefer it because it ripens early and the stalks are small with small cobs and large kernels. I have tried many kinds; but none appears to equal this in combined results. 2. I cannot say how much shelled corn it will yield per acre, but I know it yields well. 3. I plant 3½ feet apart each way with four or five kernels to the hill. 4. Barn-yard manure gives me better results than anything else I have tried. I use a Hillsdale swivel plow to plow the land, turning the latter all over one way, then I harrow it down with a square harrow of my own make, and bush it as smooth as possible. Next I mark it with a pole and chains four rows at a time. I plant it with a northwestern corn planter, and cultivate it with a cultivator made at Ithaca, N. Y. I cultivate it both ways, leaving but little to hoe by hand. E. M. C.

CLARK'S FALLS, New London County.—1. I am growing a variety of my own production having the old Rhode Island White Cap corn as a basis, crossed with the yellow Longfellow and a short variety of White Cap corn. This gives an ear about 10 inches long, eight to 10-rowed with a medium cob, well capped over. I prefer it for this soil, as it gives better results. 2. Under good culture it averages 50 bushels of shelled corn per acre. 3. 3½x3½ feet; four stalks to the hill. 4. In a series of experiments begun last season, but not completed on account of bad weather, superphospate gave a little the best results. I formerly used Bowker's Hill and Drill phosphate and obtained better results than with any other complete manure. The land is plowed and harrowed thoroughly and allowed to remain for a few days, then marked both ways and planted. The crop is cultivated until waist-high, being in the meantime hoed twice. For tools I have used plow, harrow, cultivator and hoes. J. B. P.

Idaho.

ALBION, Cassia County.—This is not a corn country. Sweet corn alone is raised here. It grows very nicely and is entirely clear of any insects that are in the habit of eating inside of the husk. The only tool we use is the common garden hoe. W. H.

Illinois.

CHATSWORTH, Livingston County.—Corn is one of the principal crops raised here. Soil a vegetable mold dark colored on stiff yellow clay subsoil. There has been a good deal of tile-draining on the low grounds during the last five years. All raise dent corn, mostly early varieties, growing from eight to 10 feet high. Large varieties such as Shoe-peg and Chester County Mammoth, make large stalks, but fail to mature when we have a cool, wet summer. Season, manner of culture, variety and brains have so much to do with the yield that it is hard to estimate the average; but it will not vary much from 35 bushels of shelled corn per acre. I have seen large fields that would make 75 bushels and others that would not make 15. It is all planted with two-horse planters and check-rowers, and we plant two rows at once three feet six inches to three feet 10 inches apart. No commercial fertilizer has ever been used in this neighborhood on corn. Stable manure is mostly spread when hauled, and when a good coat has been plowed under, its effects can be seen in a stronger growth of corn for a number of years. Most farmers have not learned the value of manure. The best crops are raised by fall plowing, stirring the surface in the spring with cultivator, and harrow, or with an Acme or disk harrow. All use two-horse cultivators cultivating both sides of the row at once. Most of them use shovels which work too deep for a large corn. Some use the gopher which ridges up too much. Some have knives which work much like the Acme harrow. J. R. B.

JERSEYVILLE, Jersey County.—We have no special name for our corn except Gold Drop yellow, or large 16-rowed, white. These are the only kinds largely planted. The yellow made 65 bushels on plowed land; the white three years from sod, 60 bushels per acre. Our corn is planted with a common planter three feet six inches apart, and checked the same distance apart. All manures we make are put on grass or wheat land. When we think the land is tired out for wheat, we use it for clover. We have been using a two-horse cultivator to a very large extent, as we are satisfied that it gives better results than a double-corn plow. M. C. S.

BEVERLY, Adams County.—1. I use the common yellow corn, because it turns out as well as any, and is better for stock. 2. I do not shell my corn; but I get 60 bushels to the acre of corn in the ear. 3. I plant three feet 10 inches apart. 4. I always use stable manure. Tools: the three-horse plow, and I harrow as much as possible, and cultivate. W. B.

BELLEVILLE, St. Clair County.—1. I plant yellow dent, because it matures early and yields more than any other large variety I can get. 2. From 40 to 60 bushels per acre. 3. The rows are 3½ feet apart. I plant with a drill, and leave the plants standing 12 to 15 inches in the row. 4. We apply all the barn-yard and stable manure we can get and turn under a clover sod to get the best crop, and give a rotation of crops. We use the two-horse harrow with straight teeth, either before or after the corn has come up. Next we use the two-horse cultivator, giving three plowings, following the second plowing with the hoe, cutting every weed missed by the cultivator, and all supernumerary stalks of corn. E. J. M.

Indiana.

BURLINGTON, Carroll County.—We prefer the largest-eared corn that we can get, which will ripen by the middle of September. Such corn will produce more per acre with us than small varieties. Our corn will average 60 bushels per acre. We plant 3½ feet apart each way, with three stalks to the hill. We use only stable manure. We stable most of our stock in winter, using plenty of straw for bedding, making all the manure we can. The best fertilizer that we have for our soil is clover. We plow up a clover sod for corn; seed the corn to wheat in the fall; sow the wheat ground with clover in the spring; let it lie one summer in clover and plow again for corn. I was taught in my younger days to cultivate corn by plowing deep with the double-shovel plow or the two-horse cultivator; but from reading the RURAL'S experience I have learned better. Now I use the spring-tooth cultivator; if I think the ground needs stirring deeper I plow the second tending, then use the cultivator again. J. M.

WATERLOO, De Kalb County.—1. I have grown for several years a large yellow variety of field corn streaked with red, with a small red cob and deep, wide grains—evidently a mixed sort. I prefer this to any other I have tried, because it yields well, is a sure grower, and will mature here if grown on rich, warm soil, and on any ground in a favorable year

The stalks are medium and don't sucker, and, barring its slow maturity, it pleases me as well as any I could get. 2. About 60 bushels on an average. 3. 3½ feet each way. 4. So long as I feed all crops raised on the farm to sheep and other stock, I have all the stable manure I can use, and, of course, have no need of commercial fertilizers. My soil—a sandy loam—is in a high state of cultivation, and hence the more simple tools do me, such as a cultivator, common harrow and plank drag. The latter is seldom used except as a leveler.

C. C. B.

Indian Territory.

OO-WA-LA, Cherokee Nation.—I prefer large white dent corn, because it supplies all demands for corn on the farm, being liked by horses and hogs as well as any, and it is much the best for corn-meal which is a staple article of diet in this country. I cannot give the average yield. My yield the past season was fully 50 bushels per acre. I plant 3 feet 10 inches to four feet each way. I have never used any manure for corn. The tools used in raising a crop differ somewhat, according to the ability of the farmer, and also according to the number of acres to be cultivated. The really necessary tools for 40 acres would be a turning plow, harrow, two-horse cultivator, and, possibly, a hoe, yes, and a corn planter, a two-horse check-rower preferred.

J. A. F.

Iowa.

LIME SPRING, Howard County.—1. Yellow dent, because it is early and will ripen here. 2. From 30 to 35 bushels. 3. Three feet eight inches apart each way. 4. Barn-yard manure. Drag, Monitor sulky cultivator or four-shovel plow. A. M.

BELLE PLAINE, Benton County.—1. I prefer a yellow red-cob, dent variety, which I have raised for 15 years and improved by selection, because the cob is small, and it yields well, and I have never had any trouble with the seed. 2. On ordinary soil with good cultivation the yield will be 40 bushels of shelled corn per acre. 3. Three feet nine inches apart both ways. 4. Coarse barn-yard manure drawn in spring and plowed under as soon afterwards as possible, gives the very best results. We use a harrow first, then the double-shovel walking or riding plow, which cultivates one row at a time. H. B.

SIBLEY, Osceola County.—1. Any of the medium early dents. The flints are too hard and do not do well here. 2. Forty to 50 bushels well cared for. 3. Three feet eight inches each way. 4. Nothing but stable manure is used here. For tools we use a plow, smoothing harrow, four-row marker, two horse corn-planter and a two-horse cultivator. I prefer the walking. G. S. D.

Kansas.

HOWARD, Elk County.—1. For rich bottom land I prefer large yellow dent, and for thin high land the large white dent, because they yield more per acre than the small, early varieties. 2. From 30 bushels to 75 bushels or more per acre, according to the nature of land and the season. 3. Three feet eight inches apart each way. 4. I use nothing but barn-yard or stable manure for any crop, commercial fertilizers being almost unknown in this country. In cultivating I use a common harrow and two-horse cultivator.

J. C. T.

Maine.

SKOWHEGAN, Somerset County.—The eight-rowed flint is the kind of yellow corn planted here on account of its earliness. Sweet corn is taking its place, as it will purchase more yellow corn than can be grown on the same ground, and be earlier disposed of. The usual practice is to break the ground just before planting, seven inches deep; from 20 to 25 two-horse loads of barn manure are put on per acre. Some put it on the sod and plow it in, and others on the furrow and harrow it in. About 400 pounds of superphosphate are applied in the hills at the time of planting. If no barn manure is used, 200 or 300 pounds more of phosphate are used, half broadcast. The rows are 3½ feet apart; the hills 2½ to three feet apart in the rows. The crop is worked twice thoroughly with a cultivator, and hand hoe, and once or twice more with a common one-horse walking cultivator. From 30 to 40 bushels of yellow corn is the usual crop, and from 1,000 to 2,000 cans of sweet corn per acre. Price to farmers three cents per can of 26 ounces. The wheel-harrow has been and still is a great favorite; but the spring-tooth is being purchased more of late. Barn manure and phosphate used together give better results than either used alone.

J. H. L.

WEST FARMINGTON, Franklin County.—1. The 10-rowed field corn and Dutton corn are used. I prefer the 10-rowed because it is earlier. 2. Average yield 40 to 50 bushels of shelled corn per acre. 3. We plant in hills three feet apart. 4. I use the finest rotted barn-yard manure—sheep manure mostly. We plant mostly by hand, and use a horse cultivator in cultivating. G. J. P.

CARIBOU, Aroostook County.—We are in the far Northeast of Maine and don't raise any field corn. F. P. K.

Maryland.

SWANTON, Garrett County.—1. The King Philip and several varieties of the white flint, because my altitude is about 2,500 feet. 2. From 50 to 80 bushels. 3. 3½ x 3½ feet. 4. Barn-yard manure plowed under and ground bone and hard-wood ashes sown broadcast and harrowed in, with a little ammonia to each hill as a starter. We use the Thomas Smoothing harrow till the corn is five or six inches high and then a five-shoveled cultivator. My part of the State is not a corn section. C. T. S.

BALTIMORE, Baltimore County.—1. White, because it yields better than yellow in this soil, a sandy loam. 2. Two feet eight inches by three feet. 3. From 40 to 50 bushels; one lot of 10 acres this year, yielded 57 bushels per acre. 4. Barn yard manure. For tools we use the Oliver chilled plow, two horses, a spring-tooth harrow, an ordinary harrow and roller; then cover with a small plow. Cultivators, Iron Age one way, and double-furrow plow the other. S. H.

Massachusetts.

FARNUMSVILLE, Worcester Co.—1. The corn I raise and prefer is a mixture of Longfellow and a twelve-rowed variety, the name of which I don't know. I prefer it because I get the best results from it. I get from 65 to 75 bushels per acre. 2 Forty-two inches each way. 3. Stable manure. The land is plowed fine; then I spread the manure, harrow both ways with a spring-tooth harrow; next, run a stone-boat over it to smooth it; after which I use a four-toothed marker both ways. I plant with a hand machine. When the corn is about two inches high, I cultivate with a spring-tooth cultivator; then again when it is about three feet high. It would be better to say that one should cultivate any time when the weeds start. I keep the ground just as level as possible—no hilling up for me. I plant about one inch deep, as near May 26 as possible. D. S.

BYFIELD, Essex County.—1. The variety I prefer is a cross, or mixture of Longfellow with a low-growing, large-eared variety, the name of which is unknown to me. I like this because it gives more grain in proportion to fodder than any variety I have ever tried. 2. From 50 to 60 bushels per acre, on light land. 3. About 3½ feet each way. 4. High-grade complete fertilizers for profit. I use barn-yard manure when I have it, because I have it. I use a common five-tooth cultivator and hand hoe. A. P.

PEPPERELL, Middlesex County.—1. Northern flint 90 days, is the only corn to grow here. 2. 75 bushels. 3. Three feet each way. 4 Mixed barn manure is all the kind I use. All kinds of tools are used for cultivation. There is very little difference between them so long as they accomplish the end—to work the soil well. A. K. S.

Michigan.

WEST CAMPBELL, Ionia County.—1. The variety of corn generally cultivated here is known as oil dent, or yellow dent. This seems better adapted to our soil—a greater portion of which is sandy loam—and climate than any other kind. It is seldom caught unripened by early frosts. 2. The yield in shelled corn ranges from 40 to 60 bushels per acre—making perhaps an average of 45 bushels. 3. We plant in rows four feet apart. A spring-tooth cultivator made for this purpose is commonly used in the first and second cultivations; next a double-shovel cultivator and then a single-shovel plow. Some farmers are using Reed's double corn cultivator. 4. I do not know of any one using artificial or manufactured fertilizers. The only manure used is barn-yard manure accumulated from the horse, cattle and sheep stables. A clover sod is selected for corn as a general rule, and it is plowed in the fall and spring according to the convenience of the farmer. Opinions vary as to the results of plowing at these seasons.

C. F. H.

BIRMINGHAM, Oakland County.—1. Tucker dent, a yellow corn, is used here. It matures early, has a small stalk, is medium to good hight, has no suckers, and has small cobs which weigh but 10 pounds to the bushel of 70 pounds of ears, which break easily in husking. It excels all other varieties for quantity of shelled corn to a bushel of ears. viz; 60 pounds. 2. From 45 to 50 bushels per acre on an average. 3. Three feet nine inches, with from three to five stalks per hill. 4. We don't use any manure or fertilizer. I always turn over yearly an old meadow of 30 to 40 acres, plowing it about five inches deep, and cultivating it well before planting. Then I follow this with a rotation of crops and use barn-yard manure with all succeeding crops. For tools I use the Oliver chilled and subsoil plow, and a 40-tooth drag, followed by a stiff two-horse frame cultivator. Then I smooth with a drag, mark and plant with a hand planter. When the corn is well out of the ground and we can follow the rows, we use the Deere two-horse wheel cultivators, and keep at it until the corn is too large. Then we follow twice or more—as needed—with a one-horse cultivator, keeping the ground well cultivated and free from weeds at all times. O. P.

Minnesota.

HERMAN, Grant County.—1. In this part of Minnesota we plant mostly Compton's Early flint corn. Angel of Midnight, King Philip, Canada Early and Minnesota White Flint are also used as well as Pride of the North dent, North Star dent and Dakota yellow dent. Compton's, however, is preferred because it is the surest to ripen in this Northern corn belt. It takes about 90 to 95 days from planting to ripen. 2. From 35 to 75 bushels per acre. 3. Generally 4x4 feet apart each way. 4. Barn-yard manure, no other is used here. A few use two-horse hoe cultivators, and many use one-horse cultivators of different makes. The Planet Jr. new pattern horse-hoe cultivator is the best here for corn and potatoes. E. S.

MINNEAPOLIS, Hennepin County.—1. The common eight-rowed yellow dent is raised here because it is the best for feeding and selling in market for milling purposes. 2. About 35 bushels per acre on an average when manured. 3. From 3½ feet to four feet apart each way. 4. Common barn-yard manure is the only fertilizer used here Where it is liberally used it gives results. The tools used are the common harrow and for after culture the sulky cultivator. W. S. MCL.

Missouri.

OZARK, Christian Co., February 25.—The winter in Southwestern Missouri was very mild until the middle of February. Only about two inches of snow had fallen, and the ground had frozen but an inch in depth An unusual amount of rain had fallen and the creeks had been impassable for fording six times during three months. Out-door work, such as clearing, logging and fencing, was pursued with much comfort, with scarcely the loss of a day. It was feared that feed would be scarce, and grain, hay and fodder were held at high prices in the fall; but the long-continued mild weather has caused a drop instead of an advance in prices. Plowing could have been done every week except that part of the time it was too wet. Fruit buds were kept swollen and fears were felt of the effects of possible severe cold weather. Wheat was bare all the time, but in spite of sudden changes, it has kept quite green, though not looking quite as well as in previous years.

It has been a splendid time for getting a supply of summer fuel, as the only expense for it here is the work of preparing it. Freighting over the road from Arkansas and the counties contiguous to Springfield, which is the metropolis of this section, continued all the time. Large amounts of cotton pass almost every day. Hogs, poultry, hides, dried fruit and cedar posts seem to form the bulk of freighting. Very few cattle pass over the road. Camp houses at convenient distances are to be found where for 25 cents bunks for sleeping are provided, with fire and water for warming and cooking purposes. Each freighter carries his own provisions, coffee-pot and frying-pan. There are sheds for the teams, but feed is generally carried along; although corn, sheaf oats, or corn blades, Timothy and clover are raised on many farms, but not as a general feed as yet. While there are quite a number of railroad lines, some counties having three or four, yet there are other counties and sections that are 50 to 100 miles from a good market. Springfield with its better market facilities, packing-houses and manufactories draws trade from a large section and there are cheap accommodations for the poorest freighter and wool and timber haulers, and in the various feed and wagon yards are gathered every night hundreds of men and teams, and the Missourian or "Arkansaw traveler" that cannot around the camp-house stove prepare the to him luscious meal of meat, eggs, bread and coffee, is the exception. Among the outfit the men have often found a deer or its hide and on rare occasions a bear to sell, while "coon and possum" and wild turkey are quite common. Since Feb. 15th we have had freezing weather every day, the thermometer having dropped for a few hours below zero. Six inches of snow fell on February 17 and it was not entirely gone when more began to come to-day. Quite a large immigration is tending this way, some stopping here where timber land can be bought at from $4 to $8 an acre, from which good farms can be made or improved, and partially improved farms can be bought for from $10 per acre upwards. There are fair schools in the country for six months in the year, with high schools, academies and colleges in the towns and cities. There is preaching by some denomination in almost every school-house, and in the towns and some places in the country, good church buildings are found. There are some pieces of very rough land that can yet be homesteaded, and many of the immigrants are going still further south, where land is still cheaper, though rougher, and vacant lands are more frequent. Living expenses are quite low here as compared with further west, but the probability of one's doing well depends much on other things. When market facilities are better developed, canning factories and evaporators more common, this will undoubtedly be a great fruit country. At present while almost all kinds of fruits do well, yet fruit raising is in a very crude state, and I have yet to see a well-cared for orchard or fruit garden, though I have seen green and dried fruits that compared favorably with the best. J. M. R.

DE SOTO, Jefferson County.—1. I am a "new" farmer, having made only one crop. I used Leaming corn for hills, and a variety called Gourd-Seed (white) for bottom land. 2. From 40 to 50 bushels. 3. Three feet. 4. I have had experience with barn-yard manure only. For tools I use a double-shovel and five-tooth cultivator. E. F. W.

KING CITY, Gentry County.—The yellow dent is the most used here, as it is the best for cattle and hogs, as it is not so rough and hard as some of the flinty varieties, and hence it is used almost exclusively for fattening stock, giving better satisfaction than flint kinds. It makes from 30 to 65 bushels per acre according to the season. In checking corn we generally plant three feet 10 inches, and where we "list" we put in the seed from 12 to 16 inches apart in the drills. No manure is used here except stable manure, as the country is mostly "new" and it does not pay to use costly fertilizers, at least, the farmers think so. The listers are used to plant about half of our corn and a corn planter and check-rower most of the remainder. A harrow is used considerably after planting, and a two-horse cultivator to finish. A. S. M.

Nebraska.

BROKEN BOW, Custer County.—1. The Bloody Butcher variety is chiefly used because it matures early and stands drought well. 2. About 40 bushels. 3. Three feet 10 inches each way. 4. I have used no fertilizers but stable manure. The harrow and walking cultivator are our tools. We have such dry weather here that corn never fills out well. "SUBSCRIBER."

WESTON, Saunders County.—1. Yellow dent field corn gives the best result. 2. From 50 to 75 bushels per acre. 3. Three feet eight inches each way. 4. Barn-yard manure alone is used if any fertilizers are applied. We plant with a two-horse Brown planter and check-rower, use a square-tooth harrow and a heavy roller and a two-horse tongueless cultivator. P. T. N.

New York.

SANDY HILL, Washington County.—1. An early yellow dent. 2. It will generally bear two ears on a stalk and has small cobs and large kernels. It will yield 75 to 100 bushels on rich soil with good cultivation. 3. Three and one-third feet each way; but I intend to plant 3½ feet by 18 inches. 4. Twenty loads per acre of farm manure plowed in, and 400 pounds or more of phosphate broadcast. I use the smoothing harrow, and Planet Jr. cultivator. M. T. W.

GOLDEN'S BRIDGE, Westchester County.—1. White and yellow flint corn is planted in this vicinity. 2. From 30 to 50 bushels per acre of shelled corn are raised on good ground. 3. Corn is planted usually 3½ feet in check rows. 4. Barnyard manure alone is used on sod and plowed in. I don't think 10 tons of fertilizers have been used in 10 years—ninety-nine-hundredths of the work is done with a common corn plow. H. A. C.

OTSELIC CENTER, Chenango County.—1. Canada eight-rowed we consider the earliest variety. 2. Fifty to 75 bushels per acre. 3. Three and one-half feet each way. 4. I have used nothing but poultry manure; most farmers use fertilizers for the crop (Bowker's Hill and Drill;) others use stable manure, hog manure being preferred. I am now using a cultivator made at Ithaca, an old-style tool. Not much corn is grown here, as the season is rather short for it. W. A. S.

FORT ANN, Washington County.—1. Compton's Early; it is early and yields the best with me. 2. From 40 to 60 bushels per acre. 3. Three and one-half feet each way. 4. Stable

manure. The Acme for fitting the ground and a Michigan hoe and five-tooth cultivator for the cultivation. Soil clay. T. H. J.

JAMESTOWN, Chautauqua County.—1. I raise a flint corn thinking there are more of the fat-forming elements in it. 2. About 50 bushels per acre. Three feet eight inches apart in order to sow Early Munich turnips between the rows. 4. I have never used any fertilizer but barn manure. My tools are an Albany drill for drilling in, and a Whipple two-horse harrow with two teeth out. I sow turnips in August. J. E. L.

MINAVILLE, Montgomery County.—1. Longfellow eight-rowed yellow flint. The ears are better than in other sorts and there are more bushels of shelled corn in proportion to the ears. 2. Ordinarily from 50 to 60 bushels of shelled corn per acre without manure on sod land. 3. Three feet and a-half apart. 4. Manure from cows. I use Wright's patent one-horse cultivator, and give level cultivation. H. W.

JAMAICA, Queens County.—We use Blount's Prolific and Mountain Giant, because they have large ears and large stalks. Yield, on an average, 70 bushels to the acre. Distance 4½ feet between the drills and from 12 to 15 inches between the grains. We use mixed barn-yard manure. Tools used in working, plow, cultivator and hoe. J. T. M.

STOCKTON, Chautauqua County.—1. I prefer King Philip, for its adaptability to my soil and situation. 2. From 50 to 100 bushels, the yield depending on the season a good deal. 3. Three and a half feet each way. 4. Hog, horse and hen manure if used with care are good enough. I furrow out with a shovel-plow and put a forkful in each hill. I use level culture. Phosphates do not answer with me nearly so well as manure. I use a shovel-plow for marking out the furrows and the Planet Jr. cultivator, with hilling teeth, to hill up a little the last time and I brush around the hill sometimes with the hoe.

F. M. V.

SPRINGWATER, Livingston County.—1. Red-Glazed white flint or Smut-nose, because it has small cobs, suckers little and is early. 2. Forty to 60 bushels per acre. 3. Forty inches each way. Hen manure and plaster in the hill. I use the Ithaca or Planet Jr. cultivator with five straight teeth, and give level culture. R. J. R.

Ohio.

GUYSVILLE, Athens County.—1. Leaming, because its cob is small and it is early and its deep, yellow kernels with large germs make a very rich feed. 2. On our upland, 40 to 50 bushels to the acre is a fair crop; on river and creek bottoms the yield reaches 80 bushels. 3. We plant Leaming 3½ feet each way. We had a fine crop last year planted 2x4 with two stalks to the hill. 4. Barn-yard manure. I have never tried any commercial fertilizer, but it has not given satisfaction when used here. I use nothing in cultivation but a spring-tooth cultivator made by myself from the teeth from a spring-tooth harrow, five of which are used. This gives level culture during the entire growth. A. B. S.

MARSHALLVILLE, Wayne Co.—1. I have not yet found my ideal field corn. I am growing a cross between the Golden Beauty, Leaming, and an early, short and thick-eared yellow variety; all things considered, it suits me as well as any I have tried. 2. I use a two-horse planter and make the rows three feet eight inches apart with the hills about three feet apart in the row. 3. I get from 45 to 70 bushels of shelled corn per acre. 4. I obtain the best results from a liberal application of well-rotted stable manure. I aim to plow the ground early in the spring; then fit it ready for planting with the Acme harrow. About the time the corn commences to show, I go over it once or twice with a fine-toothed smoothing harrow. I then use the one-horse Planet cultivator and work in the level system of cultivation. E. B. Q.

GALLIPOLIS, Gallia County.—1. I use a large white corn, without name, because it gives more shelled than any other. 2. I think the yield is as high as 100 bushels per acre on good ground. 3. Three feet nine inches. 4. Only manure from the hog-pen and from the horse stable. I cultivate with treble-shovel plow with narrow shovels, as nearly level as possible. W. H.

Pennsylvania.

JOHNSTOWN, Cambria County.—I cannot afford to raise field corn. What I use comes from the West. My main products are cream, for ice-cream and town consumption, fruits and maple sirup. G. M. W.

BAINBRIDGE, Lancaster County.—1. I prefer the Leaming corn, because it is early and productive. 2. It gives from 60 to 70 bushels of shelled corn per acre. 3. I plant 18 inches apart in the row, and the rows 39 inches apart. 4. I have not used anything but a light dressing of stable manure plowed under. In cultivating, a Thomas harrow is used, and next a one-horse shovel-harrow; then a two-horse scraper plow. I would prefer to drill in some fertilizer before I plant the corn. J. C. E.

NORTH EAST, Erie County.—I have two small farms—one on gravelly land near Lake Erie, and the other two miles further south on a hill-side. Here the soil is clay or clay-loam. On the first dent corn of medium size, with deep kernels and small cobs, yields from 80 to 110 bushels of ears per acre. The land for it is manured with barn-yard manure with some home-made compost composed mostly of hen manure, wood ashes and gypsum, in proportion of two-fourths of the former and one-fourth of each of the latter. On the clay land a yellow eight to 10-rowed variety of flint corn thrives best. The treatment of the land is the same as in the other case except that some complete fertilizer, in addition to the ordinary manure, is drilled in at the rate of 200 pounds per acre after the ground has been well fitted for planting. The yield here is about the same as on the other farm. The corn kernels are planted three feet eight inches apart. The tools employed are the Syracuse steel beam plow, the Acme pulverizer, a square harrow and a Buckeye two-horse spring-tooth cultivator. G. W. G.

BRANDYWINE SUMMIT, Delaware County.—1. The corn that I have been growing for several years is a mixture of Gourd-seed and shallow-grain varieties, my aim being to get a large, long cob and deep grain. By planting a mixed corn I think the blossoming period is lengthened, giving the pollen a better chance to fertilize the ears and making them fill better. 2. My yield, on an average, is about 75 bushels per acre without manure. I have grown 106 bushels on a measured acre with stable manure. 3. Four feet each way. 4. Stable manure and good bone superphosphate. H. T.

Tennessee.

WARTRACE, Bedford County.—1. White Southern, Shoe-peg and Durham varieties of corn are raised here. I prefer the first as it sells most readily and makes the best meal. 2. In field culture the yield is from 50 to 80 bushels of shelled corn per acre. 3. Three and a half feet each way, with two kernels in a hill. 4. I use no manure except on places inclined to "wash" and there barn-yard manure is applied. I rotate with clover, wheat and corn, once in about six years on the same land. I use the Oliver chilled turner, the Thomas harrow, a gopher, a one-horse harrow and a double shovel. T. A. S.

SCOTT, Henderson County.—1. I prefer the Centaur corn—a dent red cob variety—because it yields more shelled corn to the bushel of ears than any other—62 pounds to 70 pounds of ears. 2. I think that with proper manuring a yield of 100 bushels per acre could be obtained. 3. We plant about three feet ten inches by four feet and a half apart. 4. Very little fertilizer has been used, and not much stable or yard manure. J. Y. M.

Vermont.

WILLIAMSVILLE, Windham County—1. I use the small Holden Improved, because then I am sure of a good growth of sound corn. 2. Fifty bushels of shelled corn per acre. 3. Generally three feet four inches both ways. 4. Barn-yard and stable manure from cattle, horses and hogs. I also use the Bradley or Pacific Guano in the hill. Belcher & Taylor's cultivator and horse-hoe are run both ways, and I use hand hoes when necessary. S. M.

HANCOCK, Addison County—1. An old variety of yellow flint corn which I have raised a good many years. No dent variety is grown here because the seasons are too short. 2. The last corn we raised on the hill yielded about 40 bushels of shelled corn per acre. Corn is raised mostly on river land. 3. About three by three feet apart, and we cultivate both ways. The small Canada corn we raise on the hill is planted three by two feet and cultivated one way. 4. Bradley's and Stockbridge's, mostly Bradley's. I use hog and hen manure and ashes. Wheat, oats, buckwheat and potatoes are the crops mostly raised on our hill land. Improved tools are sadly scarce on most of our hill farms. E. A. F.

Virginia.

PEAKSVILLE, Bedford County.—1. I use a cross between the Poor-house, Mammoth and White Surprise corn. It is better adapted to our soil and climate than any I have been able to find, because it gives one very large ear to each stalk which we think better than two small ones, besides saving labor in husking, etc. This corn has a large cob and deep grains. 2. From 20 to 40 bushels of shelled corn under general cultivation. 3. In drills 3½ to four feet apart, and 18 to 24 inches in the step distance, varying in accordance with the quality of the land. 4. Clover and stable manure. I cultivate very deep until the corn is six or eight inches high; after that time I cultivate as shallow as I can to keep it clean. I use double Malta plows with the attachments. R. K.

RINER, Montgomery County.—1. I prefer the Fleming yellow corn for soundness and early maturity. It yields on our lands, without fertilizer, from 40 to 60 bushels per acre and sometimes more, according to the quality of the land. I have never used any fertilizer on corn. I plant the grains 18 inches apart. In cultivation I use Hench's double-row planter and cultivator and the Cutaway harrow. I prepare my land in early winter with the Oliver chilled plow and plant on April 25th. W. S. S.

CROCKETT'S DEPOT, Wythe County.—1. Leaming, because it yields as well as any. Yellow corn always does best with me. 2. From 20 to 50 bushels per acre according to the land. 3. 2½ x 3½ feet; two stalks to a hill. 4. I have had no experience with any fertilizer except barn-yard manure which always gives good results, especially on clover sod. I use a double-shovel plow on rough land and the Planet Jr. horse-hoe on smooth land in cultivating, and always the hand-hoe more or less. E. A. A.

Wisconsin.

RIPON, Fond du Lac County.—1. I plant yellow dent and Canada Smut. The yellow dent yields more corn to the acre and better fodder than any other dent I have tried. The Smut yields as much corn and better fodder than the dent. 2. Yield from fifty to sixty bushels per acre. 3. I plant in hills forty inches apart each way, with from three to four kernels in a hill. 4. I use manures made on the farm—20 large loads to an acre. It is hauled out in the fall, spread and plowed under. I cultivate in spring, using a two-horse Monitor cultivator. J. B.

CLINTON, Rock County.—1. Medium yellow dent, because it is the surest to get ripe. 2. The yield varies in different seasons. 3. Three feet ten inches apart each way. 4. We use all the stable manure we have, promiscuously, as we can draw it in winter. I have had as good success on good heavy sod—either Timothy or clover—as with manure. I use a slanting-tooth harrow and a six-shovel two-horse riding cultivator. J. C. B.

What Others Say.

THE R. N.-Y.'S LARGE YIELDS OF CORN IN 1880.

REPORT OF THE JUDGES.

Copied from the R. N.-Y. of November 13, 1880, page 750.

"REPORT on a field of corn at Hewlett's, Long Island, belonging to the R. N.-Y., made October 12, 1880. Size of plot, 310 feet by 122 4 or .87 of an acre of corn—Blount's Prolific—sown by machine in rows four feet three inches apart and each single kernel intended to be 5 inches from its neighbor. Flat culture, with, as we understand, 300 pounds of Mapes's special corn manure harrowed in broadcast upon planting, 100 pounds of the same when the corn was six inches high, and 100 pounds of potato fertilizer when about 18 inches high. From a judicious selection of stooks and careful measurement and weighing, we find the total yield was 227 bushel baskets of ear corn, or 261 bushels upon an acre.

We also shelled and weighed a quantity and ascertained the gross weight of 3⅞ baskets to be 136 pounds or 35.1 pounds to one bushel, and further that 35 pounds of corn in the ear gave 28.95 pounds of grain and 6.05 of cob and measured 17.1 quarts. This calculation showed that the equivalent of 261 bushels of corn on the cob was 139 4 bushels of grain and about three bushels or a little more which Mr. Carman had selected from the most prolific stalks, and had already placed in the barn, or a grand total of about 142 bushels of shelled corn per acre.

ROBERT J. DODGE, C. E.,
Pres. Farmers' Club, American Institute.

W. N. HABIRSHAW, F. C. S.,
Chemist N. Y. State Agricultural Society.

L. C. BENEDICT,
Editor New York Weekly World."

"Upon the same day we also examined a field adjacent containing four and a quarter acres of Chester County Mammoth, and found from a measurement of one acre the yield to be 236 bushel baskets of ear corn per acre. Time pressing, we were unable to shell and weigh the net proceeds."

SIGNED AS ABOVE.

THE R. N.-Y.'S SYSTEM.

The R. N.-Y.'s system of raising large yields of corn in the most economical way, was announced in 1877, viz.:

1. *Thorough preparation of the land.*
2. *Drilling in the seed.*
3. *Flat cultivation—no hilling up whatever.*
4. *The preservation of a mellow surface.*
5. Shallow cultivation, *i. e.*, as little interference with the roots as practicable while preserving a mellow surface.

THE VALUE OF CORN AS FOOD. Why should not corn be made a staple article of domestic food? The grain when well ground and bolted makes excellent meal and flour for cakes and bread, and if the French cook could invent a hundred ways of cooking eggs, a thousand might be found for cooking this valuable grain. And yet it does not become popular, in spite of every effort to make it so. Mr. Henry Stewart says, in the N. Y. Times, that in the South, where corn bread is the staple food of the poorer people, it is discarded for wheat flour as soon as an unlooked-for and exceedingly rare dollar comes to hand with which this more popular "breadstuff" can be purchased. It is proposed by the New York Produce Exchange to get up a grand exhibit of corn for the coming Paris Exhibition this year and to add a kitchen for preparing corn foods in every known way, for the purpose of making them popular among Europeans. But why not begin at home? If Americans do not use corn as their daily food, how can it be expected that foreigners can be induced to do it? It would certainly be most desirable that our exports of corn should be increased "fifty-told," as is thought possible by some persons if this scheme shall be carried out. But it should not be forgotten that an enormous area of land in Southern Europe is suitable for growing corn, and if Europeans can be induced to make it a common food every bushel required by them can be produced on their own lands. So that, after all, we may not be able to get any tangible benefit from this laudable enterprise.....

MULTUM IN PARVO.

Keep the surface of the corn field mellow, let the season be wet or dry.....

IF one proposes to use only two or three hundred pounds of fertilizer on corn, it is best to mix it with the soil in the hill to "give the plants a start." It is perhaps better to do this than to sow so small a quantity broadcast, in which case the older plants will receive scarcely any perceptible benefit.....

WE doubt if *fresh* farm manure is to any great extent serviceable to the corn plant, when applied in the spring.....

IN 1879 the R. N.-Y. offered a large amount in prizes for the best yields of Blount's White Prolific. The first prize was awarded to Dr. W. H. Chamberlain, of Medina, N. Y. He planted 100 kernels (the number planted by each contestant) and raised therefrom 295 pounds as sworn to.....

SHOULD we strive for one large ear to a stalk, or two? The R. N.-Y.'s experience is that generally the one large ear will give as much grain as the two which, as a rule, are not over half the size. Let us say that Blount's Prolific (so-called) will yield two ears to a stalk. These two ears will not give so much grain as one average ear of the Chester County Mammoth or similar late Southern dents.....

THE average weight of corn is about five ounces to the ear. It should be at least eight ounces.....

How far apart the corn plants should stand must be answered by each farmer for himself. The richness of the soil and the kind to be planted must, in the main, be the determining factors.....

REPLANTED corn does not, as a rule, bear large ears. The reason is that the plants are too much shaded by the earlier plants. It is like raising corn under the shade of a tree....

THE valuable elements of corn are starch, sugar, gluten and oil. Southern corn contains most starch. White corn contains about 70 per cent. of starch. Sugar corn has but little starch and this is the cause of its

shriveling. Yellow corn has the most oil and a large per cent. of gluten. The hard or flint kinds contain the most gluten and the soft the most starch. Small kinds contain the most oil.....

How many corn plants in your field do not bear ears?.....

WITH the wheat crop there is no alternative but to haul it to market, and take what it will bring: while with corn the farmer is more nearly master of the situation, for if the market price does not suit, the thrifty farmer will find a way to feed it at home, and market the proceeds in a concentrated form..

MANURING in the hill is a trifle like heaping manure about the stem of a fruit tree. Better spread it out as far as the roots extend .....

THE R. N.-Y. once raised 90 bushels of Longfellow (flint) corn on a measured acre. It was not planted until June 8th.....

IN drill planting, there are some of the roots —those running lengthwise of the rows—that are never broken by cultivation.....

DON'T allow the corn field to become hidebound.....

Is it sensible to cut and slash the roots, depriving the plants of their mouths by which they feed, or to confine them to a narrow strip of soil two feet wide? If so, cultivate deep.....

THOSE readers who may refer to files of the R. N. Y. of 1879, 1880 and 1881, will see that the impetus given to corn culture and the revolution of methods since are largely due to its efforts. In like manner, it may be said, that owing to the R. N.-Y.'s potato investigations of late years, and the great yields it has shown to be practicable, this great industry is receiving an amount of attention and intelligent investigation which might, otherwise, have been delayed for years.....

IF you propose to use chemical fertilizers on corn, apply not over 500 pounds to the acre at first. It is not well to stimulate the young plant to a too luxuriant growth. Later give it another dose, and a third and last just before the sets appear .....

MR. HENRY TALCOTT, Assistant State Dairy Commissioner of Ohio, finds his silage an excellent feed for his horses, which eat it in preference to hay and thrive thereon, the only precaution necessary being to begin feeding gradually. As mentioned in the Farmers' Review, corn silage is proving a most satisfactory food for horses in the stables of Mr. M. W. Dunham, Wayne, Ill., and it seems very probable that it will soon be widely used in wintering horses in the West. Silage being succulent, seems to successfully take the place of roots, which are so beneficial, to growing colts in particular, and can be supplied at much less cost.....

CORN plants have been known to grow 28 inches in a week.....

THE average shrinkage of corn in a year is about 25 per cent. It would, then, be as profitable to sell corn at 75 cents per bushel after harvest as at one dollar the next summer.....

FIRST fertility, then seed, then cultivation.

DOES over-manuring diminish the crop?...

How much more valuable is one kind of seed than another?.....

DR. E. L. STURTEVANT says that so far as his personal knowledge goes, silage adds no nutritive of material value to ensilage.....

THOSE who have relied upon silage as the main food, and who have fed little else, have often found failure; those who have fed silage in moderate quantity in conjunction with other food, have almost to a man reported favorably of its effects. To get the best effects from feeding silage, therefore, from a theoretical as well as practical point of view, one must feed it in such a quantity that the animal shall be able to consume sufficient weight of dry food and albuminoid to supply the demand for maintenance and product....

IF acid be fed under trial, give the pickle, but because one pickle is good, says Dr. Sturtevant, do not assume that a bushel of pickles at a feed would be better, and two bushels better still. It requires brains to feed properly as in every other act in life, and brains have to be fed on experience in order to be at their best .....

MR. J. J. H. GREGORY favors the Stockbridge theory: Feed the plants what they need, just as you feed animals according to their needs. Young, growing animals require different food from mature animals kept in idleness. So squashes require different food from beans. He uses fertilizer for squashes, that contains from nine to 12 per cent. of ammonia, while bean manure is better with but two per cent. Beans manured like squashes would grow leaves and vines but not many pods, while squash ground manured for beans would grow little worth harvesting. If one knows not the condition of his soil he should apply a complete fertilizer suited to the crop to be grown.....

FERTILIZERS can not be used in place of manure for indefinite periods, as soils need humus to keep them in good condition. Mr. J. J. H. Gregory has grown onions on the same ground on fertilizers till the humus was all consumed, leaving the soil hard and difficult to cultivate. Rye or some other leafy crop should be grown occasionally and plowed in to keep the ground light.....

KAINIT IS UNSAFE TO USE for its potash, because it contains so much common salt that seeds are destroyed. It is also a dear form of potash, as the freight is the same as on the more concentrated forms. All fertilizers applied liberally in the hill or drill should be well mixed with the soil or the crop may be lost. This is especially true of nitrogenous fertilizers. South Carolina rock must be dissolved before application or it will do the crops little good the first year. Undissolved fine bone may be used for laying down grass land and it may be used liberally with perfect safety. Small doses of fertilizers where large ones are needed do but little good. Applications of 200 or 300 pounds on his land would be lost. The prices of commercial fertilizers are as low as they can be under the present system of long credits. Competition is keeping the prices down and two large firms have come to grief recently. If farmers would club together and pay cash it would be better for all parties. Take no stock in cheap fertilizers offered, as they will disapppoint every time All of which, Mr. Gregory, is, in the R. N.-Y.'s humble estimation, good, true advice.

PLANT in drills and cultivate close up to the young plants. The increase from drill planting of fodder alone, even if nothing is gained in ears, is enough to commend it. But the increase in grain ought to be at least 20 per cent.....

EVERY farmer should experiment for himself. Because farmer Brown raises 125 bushels of shelled corn per acre, it is not wise for farmer Green to assume that he can do the same by the same methods. Different soils, seed, climate, and manure are to be considered.....

TEST the vitality of seed-corn. The R. N.-Y. finds that a considerable part of its Chester County Mammoth is worthless for seed. It has been kept in a crib. An unusually warm, damp fall and winter is supposed to be the cause.....

How to test it. Pry out kernels from the ear with a small knife-blade. Place these between folds of heavy porous or blotting paper. Keep the paper constantly moist and warm. All the sound kernels will sprout in a few days.....

PRIDE of the North or Queen of the Prairie (they are the same) is probably the earliest variety of yellow dent corn. The R. N.-Y. was instrumental in introducing this variety some nine years ago.....

THE R N.-Y. again reminds those of its readers who are looking for the best ensilage corn to try the Rural Thoroughbred Flint. Several leading seedsmen offer it for sale. As already stated, it will not mature with any certainty north of Southern New York.....

THE ears often grow to the length of 13 or 14 inches—eight rows. The plants in rich soil grow to the hight of about eight feet. The joints are rather close together; the leaves very broad. Each kernel sends up from three to five stalks all of which grow to about the same hight. The R. N.-Y., beyond having introduced it a few years ago, has no interest in it.....

SUBSOILING for corn has never been shown to pay by trusty experimentation.....

WE repeat a question which the R. N.-Y. asked in 1879: "What good does it do to hill up corn on a well-drained soil?".....

SHOULD the rows of corn when drilled in, run north and south or east and west? Most farmers will answer north and south. The R. N.-Y.'s rows of Blount and Chester Co. Mammoth, which gave one of the heaviest yields on record, were east and west.....

ALL the manure in the world will not produce good corn if the plant cannot draw breath while feeding.....

No, chemical fertilizers alone will not bring a heavy crop. The same year that the R. N.-Y. raised its heavy yield of Blount and Chester Co. Mammoth, a near neighbor (a first rate farmer, too) applied 1,200 pounds of Lister's fertilizer per acre besides "a handful in the hill." His yield was about 75 bushels of shelled corn to the acre.....

ABSTRACTS.

——E. W. STEWART, in the Albany Cultivator: "The reason why corn-and-cob meal will produce as good a result in milk as pure corn-meal, is simply that the ground cob separates the particles of meal and gives bulk to it in the stomach, making it porous so that the corn-meal is more perfectly acted upon by the gastric juice. But the same weight of the cob in short-cut oat-straw mixed with the fine corn-meal, will produce even a better result, because it has a greater bulk according to weight than the cob, and carries the meal into the stomach in a still more porous condition, and will cause the meal to be raised and remasticated by the cow."

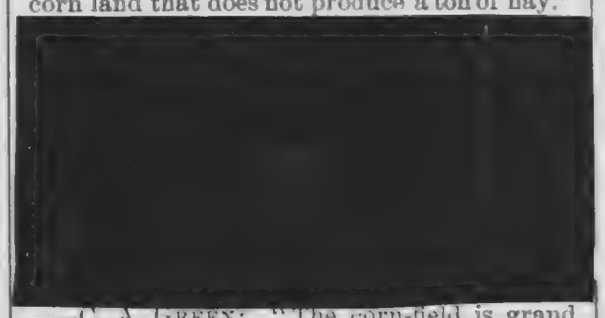
——"FEEDERS have been very slow to recognize the fact that nature feeds grain and stalk together. Animals in a state of nature eat whatever there is of grain or stalk together. When the animal is placed under artificial conditions and the concentrated grain is fed separately, there follows a large waste of the nutriment in the grain. Western cattle fed upon corn in the ear require three times as much grain to produce the same result as when the grain ground is mixed and fed with coarse fodder, and is raised with the cud and remasticated."

——N. E. FARMER: "Some of the papers speak of the Secretaryship of Agriculture as the least important place in the Cabinet. They may find themselves mistaken."

——HUSBANDMAN: "Mr. Rogers, of Binghamton, feeds his cows the year round. His silage is just as good in summer as in winter and is much preferred to green fodder by his cattle."

——"THERE is a great saving in feeding cows in summer. They will eat silage before they will taste green corn fodder, and do not drink more than one-fourth as much water. Last year I had one acre of hay and one of Stowell's Evergreen sugar corn in one field. The corn yielded six times as much in value as the hay."

——N. E. HOMESTEAD: "Corn may prove the salvation of Vermont agriculture. It should be raised for the silo on every acre of corn land that does not produce a ton of hay."



——C. A. GREEN: "The corn-field is grand to look upon in its August glory. It resembles an army of tasseled knights, decorated gracefully with ribbons, each member of which sports a silk handkerchief."

Horsford's Acid Phosphate,

The Best Tonic

known, furnishing sustenance to both brain and body.—*Adv.*

Miscellaneous Advertising.

Hood's Sarsaparilla

This successful medicine is a carefully-prepared extract of the best remedies of the vegetable kingdom known to medical science as Alteratives, Blood Purifiers, Diuretics, and Tonics, such as Sarsaparilla, Yellow Dock, Stillingia, Dandelion, Juniper Berries, Mandrake, Wild Cherry Bark and other selected roots, barks and herbs. A medicine, like anything else, can be fairly judged only by its results. We point with satisfaction to the glorious record Hood's Sarsaparilla has entered for itself upon the hearts of thousands of people who have personally or indirectly been relieved of terrible suffering which all other remedies failed to reach. Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Apothecaries, Lowell, Mass.

100 Doses One Dollar

$20 FENCE MACHINE FOR $10
Freight paid. *Guaranteed.* Hundreds in use. Circulars free. S. H. Garrett, Mansfield, O.

POOR PEOPLE'S CHANCES.

SOME years ago a city missionary was crossing one of the parks in New York on the Sabbath day and said to a lad; "What are you doing here, breaking the Lord's day? You ought to be at Church and worshiping God instead of breaking the Sabbath in this way." The poor lad in his rags looked up at the city missionary and said: "Oh, sir, it's very easy for you to talk that way, but God knows that we poor chaps ain't got no chance."

The sentiment seems to be growing that in the United States the time has arrived when "the poor chaps don't have no chance."

There is some truth in it. The poor are not shut out from making a livelihood, but the gulf between riches and poverty continually grows more difficult to cross. As the country becomes densely populated keen business competition decreases the chances for accumulating wealth by ordinary business methods.

But the same conditions vastly improve the chances for great success to those who can strike out in new paths, can furnish something to the world that others cannot.

True merit, in commodity or ability, will win easily and with grand results in this country, if the masses can be induced to recognize it. This recognition can only be accomplished by what are sometimes sneeringly alluded to as advertising methods.

What a marvelous success has attended the thorough introduction to the world of the merits of that wonderful remedy for kidney disease—Warner's Safe Cure. Hon. H. H. Warner first came to know of its curative power by being restored to health from what the doctors pronounced a fatal kidney trouble. He concluded the world ought to know of it and in the ten years since he began its manufacture he has spent millions of dollars in advertising the Safe Cure.

His methods have been ingenious—sometimes, perhaps, open to criticism, but they had a purpose, which has been accomplished.

But, mark! he never would have secured a four-fold return of the vast sums thus expended if the real merit of the remedy had not been fully proven to the millions of people reached by his advertisements.

Ten years of increasing success of Warner's Safe Cure is due, first, to intelligent and pleasing advertising, by which the people were made acquainted with the remedy. Second, to the true worth of the remedy, proved by actual experience, showing it to be *the only specific* for kidney disease, and all diseases growing out of kidney derangements.

Mr. Warner has something the people want, tells them so, then proves it to their satisfaction—success follows as a matter course.

A Good Thing for Somebody.

MR. EDITOR:—Please inform your readers that we have steady work on salary for honest, temperate, energetic men, soliciting orders for our nursery stock. Our stock is first-class. Satisfaction guaranteed. For particulars, address

Wasting the flavoring Oils of Butter, by overworking, injures its keeping quality and market value. Use Higgins' Eureka High Grade English Salt. It dissolves quickly and does its work completely.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, MARCH 30, 1889.

$25!

TWENTY-FIVE dollars are offered by the R. N.-Y. as follows: Fifteen for the largest and best shaped R. N.-Y. No. 2; $10 for the second best. Reports should be sent in before November next. Those entitled to the prizes will be asked to forward the prize potatoes to the R. N.-Y.

CATALOGUE NOTICES this week will be found on page 225.

INCOMES AND OUTGOES: The one is as necessary as the other. Whether we be successful or not in our farm life depends upon which side of the scales we place the heavier weight.

THE sprouts of *all* potatoes, so far as the writer knows, are light-colored if they grow in a dark place. To find out the true color of sprouts, *sound* potatoes must be placed in a light (sunny) warm room.

PROF. E. GALE: "I cannot repress an expression of the belief that those who have been so eagerly moving out upon the wheat lands of the Far West, beyond the corn belt, have made a financial blunder that many, when too late, will sorely regret." So wrote Professor E. Gale in the R. N.-Y. of March 8, 1879. How is it friends? Was he right?

WE are all prone to give too much thought, and to attach too much importance to a favorite theory. One man pays great attention to plant food and too little to other considerations. Another attaches undue importance to tillage. A third attaches too much importance to the variety or to "pedigree." A single factor of great crops is made to stand for all factors. The wise farmer will divide his thoughts duly between *all* the essential conditions that belong to maximum crops.

The R. N.-Y. has ever held that an agricultural journal cannot sell the seeds or plants or farm implements it announces or praises in its editorial or advertising columns and still inspire a high degree of confidence in the minds of its readers respecting the disinterestedness of its opinions touching the articles thus offered for sale.

AN instructive case, which shows how easy it is for farmers to arrive at erroneous conclusions in regard to the effects of fertilizers, occurred to a poor German farmer living within a short distance of the Rural Grounds. He began with "one-sided" cheap fertilizers. They were not worth a cent so far as he could discover. He would not touch fertilizers of any kind for a year or so; but was at length induced to try a small quantity of a "high-grade complete." Last spring he bought $200 worth of this same fertilizer and proposes to increase the quantity this spring.

SOME 10 years ago the R. N.-Y. began its advocacy of level and shallow culture for corn, drilling in the seed instead of planting in hills and cultivating both ways, and surface manuring or fertilizing. Was the system new? Many had practiced the one or the other of the several sub methods. We had never heard of any one who claimed to have practiced the *entire* method. The R. N.-Y. raised 142 bushels of shelled corn to the acre in that way. Hence its persistent advocacy of the method since. Many farmers practice it now.

AN Indiana subscriber writes as follows:

"I am a new subscriber to the RURAL, and I must say I am well pleased with my new investment. I had never taken a farm paper before, and now I don't intend to do without one, as I get very many valuable ideas of farming and gardening both from the RURAL'S experience and that of its many correspondents."

There are thousands of farmers in the country just like this one. Let them really become acquainted with a good paper and it will seem too much of a friend for them to leave it.

A RATHER queer freak developed in one of the plants of our plot of corn last season. The variety is the one that the R. N.-Y. has been endeavoring to improve for 12 years. The plant grew about 10 feet high and bore two ears about four feet above the soil. A third ear was borne within six inches of the tassel or nine and one-half feet high. As soon as the set was discovered it was supported by tying the top of the plant to a stake; the set developed into an ear of the average size. Imperfect ears or a few kernels are not uncommon in the tassel, but this is the first instance we have seen of a perfect ear from the topmost node of the corn plant. It helps to show that, under certain conditions, any node may develop and mature an ear.

WHERE CORN IS NOT "KING."

WHILE "corn is king" in this country, there are places and countries where the proud monarch is called upon to take a back seat. It may be said that America has a monopoly of the corn crop. Here all recognize its great value as a food for man and beast. In England, opinion as to its value is by no means settled. The English have never become eaters of corn-meal to any great extent. Corn has never been able to supplant the wheat of England, the potato of Ireland or the oat-meal of Scotland. The higher price of wheat has increased the amount of corn brought into England to some extent, but not by any means in the proportion that one might reasonably expect from the increase in the price of wheat As a feeding-stuff corn was first sent to England in 1833, when something like two tons was imported. As the result of careful experimenting with the grain the demand increased until, in 1847, over 75,000 tons were demanded. The largest shipments were made in 1878 when 225,000 tons were sent. Then the demand fell off until in 1888 but 140,000 [redacted] ing country and corn from that country is sold in England at one shilling per quarter (eight bushels) less than the price of our own product.

A. C. GLIDDEN believes that *corn has no characteristic of value that will bear transportation across one degree of latitude and remain.*—page 212.

BETTER HOLSTEIN BULLS.

AT the meeting of the Holstein-Friesian breeders held in this city last Wednesday, a hot debate took place over a proposed change in the registry fee for bulls. After considerable talk the following was agreed upon:

"For the registry of males dropped after March 20, 1889, $5.00; for the registry of females $1. For persons not members of the Association such registry fees shall be $6.00 for males Payment must accompany the application. And the sum of $5 shall be paid by the association for each American-bred male eligible for registration born after March 20, 1889, that is killed or castrated while in good health after it is over five days old and before it is 50 days old, on application and affidavit of the owner of the dam, on forms furnished by the Secretary and approved by the board of officers, stating date of service and birth, name of sire and dam, and date of slaughter or castration and by whom performed.

The stated object of this change is to raise the standard of Holstein bulls offered for sale. It is proposed to encourage the slaughtering or castration of inferior bull calves in the belief that, by so doing, the general standard of the breed will be raised. The discussion brought out the fact that the cheaper bulls had done good service in educating the public to the merits of the breeds. Many farmers had used them who never would have touched high-priced animals. By the use of these animals farmers had been taught the true value of better ones. The measure is rather a bold experiment and its results will be carefully examined.

RESULTS THAT DON'T HARMONIZE WITH THEORY.

SOME 12 years ago the R. N.-Y. planted, in a five-acre field, every kind of field corn it could secure. There were, according to *names*, over 60 different varieties—early, medium, late; yellow, white and red flint; yellow, white and red dent; long ears, short ears; ears with many rows; ears with few. It was a motley crop to be sure—about 75 bushels of shelled corn to the acre. It was found at that time that many varieties matured the pollen and the silk simultaneously; others did not. In some the silk matured before the pollen, in others the pollen matured and shed, before the silk was receptive. The fact, however, of simultaneous development of silk and pollen (pistils and stamens), does not insure that such plants are self-fertilized. A gentle wind is sufficient to blow the pollen from the tassel of one plant to the silk of another. This may, or may not be a provision of nature in favor of cross-impregnation. Later trials with many different kinds of sweet corn showed that the difference between the dates of the male and female maturity was more marked than in the field varieties, though in some, the maturity occurred the same day. In some, there was a difference of two days. It was found, however, that this difference was not constant in the same variety in subsequent seasons. Probably soil or thermal changes peculiar to different seasons, are the cause. It will appear, then, that the kernels on a cob are not generally brothers and sisters. They are all borne by the same mother, certainly, but it may be among the possibilities that every kernel owes its existence to a different father. Unquestionably, there are few ears of corn every kernel of which can claim the same father. It will appear to our readers, therefore, that in improving corn, it is just as necessary to regard the male as the female parentage. In every field there are many barren stalks, that is, those which produce male flowers, but which do *not* produce female flowers. Such a union could scarcely be expected to improve the prolificacy of the progeny. *Theoretically*, if we would produce a more prolific strain; if we would increase the number of ears to the stalk, or the size of the kernel or ear, we must also select the males. This can be done only by destroying the tassels of unacceptable plants as soon as they appear and before their pollen is shed. Plausible and forcible as this theory seems, the R. N.-Y. has persistently and scrupulously followed it in practice for a dozen years without results at all commensurate with its expectations.

We are led to infer that the fact that a corn plant does not in a given season develop so-called "sets" (female flowers), is not very good evidence that its pollen will exert a sterilizing influence on other plants. The experience of others, as we find it recorded, is very different. Prof. Blount claimed to have produced his so-called Blount's Prolific by this destruction of tassels on sterile plants more than by selection, crossing or cultivation. The subsequent discovery that his "Blount's Prolific" was in reality the old Tennessee Prolific, pure and simple, invalidated this claim a trifle.

Dr. E. L. Sturtevant records in the R. N.-Y. of March 8, 1879 as follows:

"In 1877, we cut out from our seed field about one-half the stalks; in 1878 we found it necessary to cut out only about one-fifth. Think of this gain: 50 per cent. of barren stalks one year and only 20 per cent. from the field planted with this seed the next year!"

Yes, farmers may, indeed, well think of it, if this mighty change were brought about as Dr. Sturtevant assumes it to have been.

I was taught in my younger days to cultivate corn by plowing deep with the double-shovel plow or the two-horse cultivator; but from reading the Rural's experience I have learned better.—page 214.

BREVITIES.

WHEN "farmin' don't pay": when a poor soil is worked by a lazy farmer.

FERTILITY, good seed, thorough cultivation. That is the way to produce a fine yield of corn.

WE have yet to meet the industrious, level-headed farmer that has made a failure of farming.

DO you know whether you are using the variety of seed-corn which will bring you the most crop?

BURPEE'S Gold-flesh potato reminds one of a sweet potato, in color, when baked, and the quality is excellent.

THE leaves on the privets are still clinging and, for the most part, green. In all previous seasons they have fallen before January 1st.

THE series of articles on "What are you farming for?" will prove one of the brightest and most thoughtful symposiums we have yet printed.

FERTILIZE THRICE. If you propose to use 1,200 pounds of fertilizer to the acre, sow 400 before planting; 400 when the plants are knee-high; 400 just before the tassels appear.

THE R. N.-Y. people, more and more every year, pity the lives which city people lead—as if by choice. The worst of prison life is the sense of imprisonment. City people are in prison without knowing it.

WE recall four experiments (one our own), in which corn from which all suckers were removed yielded less grain than other plots of the same corn cultivated in the same way, upon which the suckers were allowed to remain.

IF the land is rich and the season wet, "root-pruning" or deep cultivation may be helpful in inducing more grain and less plant. In a dry season, no matter how rich the land, the practice has, in the R. N.-Y's experience, proven notably harmful.

THE proceedings of the Engilage Congress lately held at Cleveland, Ohio, are both interesting and instructive, giving full information on the whole question of ensilage. Fortunately they have been published in pamphlet form and can be obtained for ten cents from the Secretary, W. H. Lawrence, 85 Wood street, Cleveland, Ohio.

HILLS three feet by three feet apart give nine square feet for each. Drills four feet apart and seed two and a quarter feet apart give also nine square feet. By planting 18 inches apart in drills four feet apart, there are 50 per cent. more plants on the same land. Will the yield be proportionately increased? Each farmer should be able to answer for himself.

FOR over 12 years the R. N.-Y. has (each season), saved several ears of corn from plants that seemed perfect or as nearly so as could be found. These have been planted on a little plot as far away from other corn as practicable. Care has every season been observed to cut off the tassels as soon as they appeared from all the plants of this little plot, which were too far away from the ideal sought. This is old news to our old readers, but it may be new to new readers.

To every ovule of corn is attached a long thread-like stile. This is the silk. There are, therefore, as many silks as there are ovules. Later there will be just the same number of kernels of corn. These silken threads appear to be very smooth. A better examination through a glass will show that they are not. They are provided near the top with minute hairs so arranged as to help to secure the pollen dust as it falls upon them. This pollen no sooner rests upon the end of the silk than it sets out to reach the ovary through the tubular silk. If it succeeds in its course (growth), it joins its mate, so to say, the ovule, which is at once fecundated and a kernel of corn begins its growth. If the pollen grain be arrested in its course, the ovule perishes and the result is that a "miss" will be formed on the cob.

Indust'l Societies.

THE TWENTY-SECOND SESSION OF THE AMERICAN POMOLOGICAL SOCIETY.

(R. N.-Y. SHORT-HAND REFORT.)

Latin botanical nomenclature ridiculed, reviled and defended; names long and difficult, but universal; foreign markets for oranges; fig culture and marketing.

THE second morning session of the society closed with the reading of a most ingenious and amusing paper on "Botanical Names," by Dudley W. Adams, of Florida. A radical nomenclature reform was strongly urged and the innovation proposed caused a lively sensation in the convention. In part he said: "The experiment of using dead languages in the description of plants is a disastrous failure: 999 out of 1,000 know nothing of these languages; not five in a thousand can understand these botanical names. These things have accomplished nothing for the fruit and plant grower. Every plant has five long botanical names. (Several illustrations were given, with the common name for each.) This jargon stands in the way of our nurserymen in this country to-day. Must the science of Botany ever be monopolized by a select circle or scientific clique, or shall a society of this nature take hold and apply the remedy? I ask for a Botany in English text. I stand here to demand the whole thing spread in our mother tongue. I plead for the toiling mechanics, the wild cowboys of the plains, for the millions of farmers, the child that plays amid the flowers, in behalf of the judge, the genuine scientist, the student, the youth, the middle-aged and the poor. I plead for an English Botany for an English-speaking people." He continued thus at length, being loudly applauded at the end. But much disapproval was also manifested. Mr. F. L. Temple, of Cambridge, Mass, arose before the applause subsided with protest in his eye and voice. "I don't think this paper ought to go out in this way without protest. How shall we nurserymen order stock from France and other countries? In a local community where the common names are well-known the plan might work. You can't handle the plants of the world unless you use what is called 'Scientific Botany.' Cut down names, but leave something that will distinguish each plant. The statement that five names are required for each plant is untrue. It is known to be the fact that very few have more than two names. We must have a name that can be used all over the world. We must work hard and learn Botany. You can't have anything without hard work; you can't grow oranges without work." (applause). Rev. Mr. White thought the essay ingenious enough to patent. "The same objection lies against every science you can name. Shall we, then, throw away geology, chemistry, physiology and all these sciences?" Dr. Moore thought some good points were made in the essay, but he believed in clear-cut scientific terms, with simple names for common plants. Botanical names should, however, be anglicized and simplified, so that every farmer and every farmer's child can understand. Mr. Steele said Prof. Gray had made such an attempt in his School Botany; but so far as nomenclature is concerned, we cannot do without it. Dr. Neal said, "Until Volapuk comes in use universally we can't do away with the present botanical names. Until all the nations of the world speak a common language this reform cannot be established." President Berckmans agreed that our nomenclature should be simplified, but opposed the radical change.

"American Fruits in Foreign Markets" was the subject of an essay by Henry Foster of Lake Charm, Florida, read by Mr. Lee. The orange was the only fruit alluded to. He had found a ready market for Florida oranges over the water. Some fruit was lost by decay on the way. Direct shipment from Florida to Europe was necessary. Rev. Dr. Moore thought the subject important. He said too often the fruit was not picked at the proper time, but often in bad weather. If picked when dry, and fumigated with sulphur, oranges could be shipped anywhere in the world, he thought, with safety.

Ex-Gov. Reed, of Florida, read an instructive and interesting paper on "Fig Culture." He began to grow figs in 1872 on a farm near Jacksonville. He found there some trees bearing poor fruit without any care. He said:

"The fig will grow and produce fruit in the South on any thoroughly cultivated land. The amount and character of the fruit will depend on the food furnished the trees. The roots grow near the surface, and the soil cannot be much disturbed near the tree. The fig is easily grown from cuttings. By fertilization I have improved the size and quality of all the poor varieties with which I started. I have removed trees and planted cuttings at all seasons of the year. I have one tree which has received the slops of the house, from which I have gathered annually for the last 10 years an average crop of 10 bushels of marketable fruit besides the ordinary waste. The fig industry labors under one difficulty here; frequent rains during the fruiting seasons often preclude picking at the proper time. I market from 40 to 50 bushels annually in Jacksonville and get three to four dollars per bushel. Cuttings planted in January, February or March will in 10 months produce fruit." Discussion followed. Mr. Steele said he had planted cuttings in March and gathered ripe fruit from them in the following September. Mr Mead had been growing figs for 15 years, using considerable fertilizer, but he had yet to get his first ripe fig. Mr. Williams had failed with figs on the Indian river. Various other conflicting reports came from different parts of the State. One gentleman thought an acre of figs in Louisiana would be as productive as 20 acres in Florida. He thought it too cold, and that the land was not rich enough for the fig in Florida.

(To be continued.)

Veterinary.

A FIGHT WITH THE MICROBES OF LUNG PLAGUE.

Microbes of lung plague; prevention of liver-rot in sheep; lung plague in cattle strictly contagious; its long prevalence in Europe, and recent introduction into America; slaughter of affected and exposed animals and thorough disinfection of contaminated objects indispensable for its eradication; victory over it in Cook County, Illinois; treatment of it in New York State.

AT the Albany Institute Dr. James Law read a paper on the above topic. In dealing with an animal plague the first consideration is to ascertain and determine its nature and cause. If we had to deal with a plague of "liver-rot" in sheep, the knowledge that the trematodes on which it depends must pass their early existence in certain fresh-water snails, would lead us to drain the ponds and marshes where such snails are bred, to place the sheep upon salt meadows, or to furnish a very liberal supply of salt with their food. So in dealing with the lung plague of cattle, the first consideration relates to its nature and cause. Certain leading facts in its history, clearly demonstrate that this affection is the product of a continuous and unbroken generation as truly as the race of cattle on which it preys. The disease can be traced in Europe for a period of over 2,000 years; but in all this period it can only be traced along the lines of cattle transit, and never can it be shown to have occurred where there has been no communication with a previous center of infection. A comprehensive view of the subject like this demonstrates that this is a disease which is propagated only by a continuous succession of cases, or, in other words, by a seed which is transferred more or less directly from animal to animal, and without which the malady has never been known to arise If further proof of this were wanted, it is furnished in our American experience of 40 years with this disease, during which it confined itself strictly to the Atlantic sea-board where it was first planted and toward which all cattle traffic tends, until in an evil day a shipment of Jersey cattle from the infected center of Baltimore, Md., carried the disease into Ohio, whence it was transferred to Kentucky, Missouri and Illinois. For four years the plague maintained its foothold in the Mississippi Valley, and at each infected center it was only crushed out by the most radical measures of destruction and disinfection. If we would deal with lung plague therefore, all measures for its restriction and extinction must be conceived and executed in view of this fundamental fact, that the disease is but the harvest of a specific seed sown and that all effective measures for its control must secure the destruction of this seed and of its developed product.

1st. Diseased animals are the field in which this seed is multiplying into an inconceivably abundant harvest. The growth must be stopped even if this should demand the destruction of the field as well as the harvest.

2nd. Chronic cases of the plague usually continue to carry dead masses of lung charged with the germ which lives therefore an indefinite length of time. These are therefore store-houses or granaries of the seed and must be thoroughly purged of their baneful contents even if the granary too must be destroyed.

3d. Every bovine animal that has had contact direct or indirect with the plague or with a place where the plague has been, must be held as open to suspicion for a long series of months, as also must cattle that have come in contact with her. She may bear the germ on her surface though she may personally escape the disease. She may carry it four months and then fall a victim to its infection. She may pass through a mild and unnoticed attack of this affection, and though apparently recovering may continue for many months to carry an infecting mass in the chest, which constitutes her a veritable store-house of infecting material.

4th. Every building, yard, and article of whatever kind, and every man or other animal that has been in contact with the diseased or suspected animals or their products, must be looked on as liable to transmit the infection and must accordingly be subjected to a thorough disinfection. When called to undertake such a work in Illinois in 1887, I looked over the ground and found much to deter and only a little to encourage. The General Government which held the purse-strings, and the State Cattle Commission which held the power of operating within the State, had not been able to work in harmony, and only by great trouble could I secure the adoption of laws that would allow me such power as would enable me to handle the plague with hope of success.

(To be Continued.)

LARGE YIELD OF POTATOES.

Thos. O'Hanlon, of Chinook (Dawes) in the Mile river valley of Montana, raised 108,000 pounds of potatoes on three acres of land, in 1888. Yield, 600 bushels per acre. This land is all open for free settlement to home-seekers. Get a free farm from the government land. For further information call on F. I. Whitney, G. P. & T. A., St. P. M. & M. Ry., St. Paul, Minn.—*Adv.*

Miscellaneous.

NEW LEGISLATION NEEDED CONCERNING MONOPOLIES.

No. 2.

PRES. W. I. CHAMBERLAIN.

ALL property invested in monopolies has, as hinted in a former article, need of special limitations. A monopoly is the right or power, natural, taken or conferred, to have exclusive use or sale of certain commodities or to render certain services for pay in certain localities. Monopolies are of various sorts, and may be absolute or partial; as, for example, copyrights, patent rights, ra way and street car service, gas and water service, express, telegraph and telephone service, pools, trusts, etc. Now in the case of a monopoly of any necessity or urgent convenience of life, the good of society seems to require that it be regulated by law as to cost and quality of service or commodity, or else individual greed will lead to extortion from society. Greedy human nature cannot be trusted with power unlimited to levy tribute.

COPYRIGHT.—Here Government simply protects the author in his natural right to the labor of his brain and to its exclusive sale in printed form. Copyright, however, needs few limitations. Books are not necessary to physical existence, and the supply seems equal to the demand. Indeed proper reward to authorship would seem to require that this monopoly be not further restricted but rather extended and made international.

PATENT-RIGHT.—This gives the inventor exclusive ownership and sale of his invention for a certain time. His invention is the product of his toil of brain and hand combined. Patent right is a full monopoly, and requires far closer limitations than copyright to guard the public welfare, for two reasons; first, because patented articles usually supply physical wants, which, though lower than the intellectual and spiritual, are more imperative, indeed essential to our very existence, and, second, because an inventor makes use of laws, forces and materials of nature already existing; not created by the inventor but free gifts of God to the race. To the inventor belongs the discovery of some law, force or material hitherto unknown, or of some new means or instrument for utilizing those already known. But he may not justly charge so high a price as practically to exclude society from the advantages of his invention or to work extortion. To him belongs simply the invention, the discovery; but the laws, forces or materials he discovers or helps the better to utilize belong to the race, to society; and had not he discovered them some other man would, no doubt, nave done so soon. He may not play "dog in the manger" as against society. Our patent laws should amply protect and reward the inventor and thus encourage invention. This they now do. They should also protect society from deprivation, extortion and black-mail. This they certainly do not at present do. Sharper limitations, I think, should be placed upon this kind of monopoly in three directions. 1, The inventor and his assignees should be compelled to put the invention on the market in manufactured form within a reasonable time definitely fixed, or forfeit the patent; 2, they should be forced to sell the articles at a reasonable price compared with the cost of manufacture; 3, the patent should expire in a shorter time than now, with no chance of renewal.

The first point above would prevent the patenting of a mere simple, obvious idea in mechanism, with the sale of the farm or personal right to make and use the patented device at will, and with no intimation on it that it is patented. Property inheres really only in tangible substance worked by brain and hand. The maker and seller, and not the buyer and user, of a patented article should be held responsible for infringement. Still further, as hinted, every patented article should bear in plain sight upon it the word "patented," with the date of the issuance of the patent, or the copying and use of the article should not be punishable as an infringement. Patenting a simple idea, as, for example, the "drive-well" "slip-gate," etc., has been a fruitful source of the worst forms of extortion and black-mail under the cloak of law.

The limitation noted in the second point above, would prevent extortions like those of the telephone monopoly, that vastly enrich those who "get in on the ground floor," and cruelly tax the general business interests; while the limitations on number three would prevent corrupt renewals purchased by companies already grown immensely rich on a patent, as, for example, by the "gimlet screw" monopoly, a renewal that for 17 years more "taxed without representation" consumers in every corner of our wide domain, and vastly enriched a close monopoly-corporation in one of our small Eastern States.

Our patent laws were perhaps wise and just for the slow times when they were enacted; but they are in some respects now a sad anachronism and a curse for these changed times of steam and lightning. They need thorough and wise revision. This will not come, however, until it is imperatively demanded by a public sentiment that is clear-headed, just and strong. Free discussion through our public press, and clear instruction in our schools and colleges alone can teach the great body of our citizen rulers to scan with intelligent care the philosophic basis of just law, and to demand such laws—wherever they do not now exist.

The next article will discuss Railroad property.

State Agricultural College, Ames, Iowa.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

HOUSE-CLEANING—that is the next affliction. How did it leave you last time, Mrs. Busy — with a heavy cold, or a lame back, or a sprained wrist, or an attack of nervous prostration? It usually leaves some affliction. We believe that too many women hurry and rush to get their cleaning over, without due thought of the evils that may follow it. First, there is the risk of taking the stoves down too early; we usually have a period of wet, cold weather in May, and damp, fireless rooms cause many an ailment that may be clearly laid to early cleaning. Then, there is the risk of over-work. We know by personal experience how hard it is to get any help in the country, even when one is willing to pay well for it; yet it is better to drag out the cleaning for two months rather than to half kill oneself in the effort to be done as soon as the neighbors. Let it be one room at a time—closets and drawers first. See that everything needful is in the house—tacks, kalsomine, varnish to touch up the furniture, etc., and, *please*, don't try to move heavy pieces of furniture all by yourself. We have seen too many women permanently weakened by such over-ambition. In putting down the carpets, sprinkle a little salt over the lining, especially around the edges; this will prevent Buffalo moths. One of the best things for laying

away winter clothing in is a wrapping of prepared tar-paper. It is really better than camphor, and without the disagreeable odor. Of course, all the garments thus laid away must be both cleaned and mended.

* * *

DID you read what Dora H. Vrooman said in a recent RURAL about fretting? We believe in her doctrine. As somebody—we think it was Dr. Johnson—once said, the ability always to see the bright side is worth £5,000 a year. If there is no bright side, we can always shine up the dark one. Nothing is so bad that it might not be worse—in any case fretting will not mend it. Fretting not only makes us all miserable, it injures the digestion, spoils the complexion, and drags our faces into wrinkles. So, since it does no good and much harm, let us abjure worry, and sing like Autolycus:

"Jog on, jog on. the foot-path way,
And merrily hent the stile—a!
A merry heart goes all the day,
Your sad one tires in a mile—a."

* * *

AMONG cotton fabrics the loveliest styles are among the challies. They are as beautiful in patterns and colors as any of the printed silks, very handsome ones costing about 17 cents a yard. Many are in close oriental patterns of mingled color; others resemble the French flowered silks. They may be trimmed with a little ribbon or velvet; a girl who can make her own gowns—we hope all the RURAL girls can do that—may make a challi gown handsome enough for "best," without exceeding the sum of four dollars.

OUTINGS IN NEW ENGLAND.

III.

MARY WAGER-FISHER.

AS the laddie had been greatly interested in reading the Life of Agassiz, he was eager to go to Cambridge and see the remarkable museum there established by him, and which since his death has been supported by his son, Alexander Agassiz, out of his own private fortune. Agassiz, *père*, said that he never had time to make money, but the means whereby he prosecuted his scientific researches came to him as if by magic from the pockets of the rich, while the son, who is almost as famous as was his father in science, is undeniably wealthy. A daughter of Agassiz, the elder, is now Mrs. Quincy Shaw, and she is at the head of the Boston Kindergartens. Another daughter married a man named Higginson, who, in the secession war, received a sabre cut across his cheek and lip. A gentleman once said to him, "Mr. Higginson, I would give a thousand dollars for a cut like that!"

If it were not for crossing the Charles river—bridged for horse-cars and other vehicles—one would never know that Cambridge was not a piece of Boston, and in crossing the Charles we could but recall Longfellow's poem.

"Thou hast taught me, silent river,
Many a lesson, deep and long:
Thou hast been a generous giver;
I can give thee but a song."

As neither the laddie nor myself had been in Cambridge, we counted on our fingers the places we wanted to see—the Museum, Harvard University including its Memorial Hall, the house which was Agassiz's home, the Longfellow house, the elm under which Washington took command of the army, and Mount Auburn which probably holds the ashes of more famous people than any other American cemetery.

As Cambridge is an old university town—as age is reckoned in this new country—it is the very sort of place about which one would hope to find nothing new or smart, and indeed there are no show places, but there's a quiet, unpretentious, informal air about it, that is exceedingly solid and respectable. Memorial Hall, Harvard's Valhalla, is the most pretentious and conspicuous building, and because of its collection of portraits its interior is of great interest. As it was vacation time, the bronze image of John Harvard, sitting in a bronze chair in the University Campus, was the only suggestion of a college man about. This statue represents a young and handsome man—and I could but contemplate the bigness of the oak that had grown from the little acorn that he planted. Harvard was an English clergyman who died in Massachusetts in 1638, and he left by will the half of his estate and his library to a "college" to be established at Cambridge, for the establishment of which £400 had been voted by the Colony Court some eight years before. The half of Harvard's estate amounted, according to some statements, to £800; according to others, to much less, and I have somewhere read that Harvard was the son of a man so illiterate that he could not read. The college charter of Harvard declared the object to be "the education of the English and Indian youth of this country, in knowledge and godliness." Probably more than 10,000 men have graduated from Harvard, but the craving of the Indian youth for knowledge has not drawn very heavily on any of the educational institutions originally designed for his benefit.

The Agassiz Museum contains a great many wonderful things arranged in scientific order—and the arrangement was the great point with Agassiz—but the things that I found most beautiful were specimens of the ocean bed flora, brought up by deep-sea dredging. When plants are put in jars of alcohol for preservation, the coloring matter in them is changed or destroyed, and they are left white and translucent, their beauty being entirely of form and structure, but nothing could well be more exquisite. A botanist gave me, not long ago, a native orchid in bloom, the seed stalk of the previous year still standing from the root, preserved in alcohol in a glass jar, and it is ever a thing of beauty. A clear glass fruit jar does very well for the purpose if taller than the plant, and the alcohol should be diluted with three parts of water to one of alcohol.

The wooden house which was Agassiz's home, stands on a corner and is directly on the street, with no yard intervening. It is high and rambling and was evidently "added to" as more room was needed. The university buildings constitute quite a village in themselves. The yellow house that was Washington's headquarters, and which was still further immortalized by Longfellow's residence in it, would at once be recognized by any one familiar with the pictures of it. It is at a discreet distance from the street, and the horse-cars pass it. It is still occupied, I am told, by one of Longfellow's daughters, of whom the eldest, Alice, is a moving and controlling spirit in the Harvard Annex for Women. The two younger daughters are married. Their mother was a Miss Appleton, of a wealthy Boston family, and the Longfellow children also inherited quite a fortune from their mother's brother, familiarly known as "Tom" Appleton, a very witty and attractive man, and Boston people still love to repeat his witty sayings. A son of the poet, Ernest Longfellow, is an artist, and his pictures are peculiarly poetic and dreamy in theme and treatment. He married a girl of exceptional beauty, with decided artistic talent, and she was a great comfort to the father in his declining days.

Across the street from the Longfellow house is the Lowell estate; but I was told that the poet had lived there but little, and neither that nor the Longfellow place had the trimmed and sheared look which is popularly termed "swell," and there was an evident intention on the part of the present guardians to let things comfortably grow at their own sweet will. I believe that the Longfellow house has been painted in the same shade of pale yellow ever since the poet's purchase of it, and yellow was probably its original color.

The old elm under which Washington took command of the army, is girdled with tar, to protect it from insects, and all the "sacred" elms in New England are encompassed with similar contrivances. It bears a tablet recording its greatness. The elm tree in the Common, that was older than Boston, was blown down 10 or 12 years ago, but a descendant quickly grew up in its place, and is protected by an iron fence. It is a pleasure to be in a city where trees are revered, and in the Common, with its 48 acres, are 1,300 trees, maples, lindens, tulip-trees, sycamores, oaks, aspens, etc. Both the Botanic Garden and the Arnold Arboretum were left for another time.

GOLDEN GRAINS.

TALMAGE says every wise woman buildeth her house. As no boy ought to be brought up without learning some business at which he could earn a livelihood, so no girl ought to be brought up without learning the science of self-support. * * * His advice to all girls and all unmarried women, whether in affluent homes or in homes where most stringent economies are grinding, is to learn to do some kind of work that the world must have while the world stands.....

WHEN a plant is alive, says Drummond, it finds both the sun and the rain beneficial, and they both co-operate in making it grow; but if it is dead, the very sun and rain, which before nourished it, now rot it. If the love of God is in a soul, whatever comes, be it the sunshine of prosperity or the rain of calamity (for, as Longfellow says, "Into every life some rain must fall,") all things work together for good; but if the soul is dead, the dealings of God with it seem only harmful. Blessing bestowed awakens no gratitude, and affliction only hardens and embitters.....

THE CHRISTIAN UNION reminds its readers of a truth which cannot be repeated too often, when it says that all the world loves a lover, and it loves him even more if he is a married lover. Married lovers have courteous, lovable children. The world grows gentle before them, and the prosy people who scoff at flowers and poetry after marriage look at the married lovers with a sigh and wonder if it is possible to turn back the written pages in their life's history. No; but it is possible to begin a new chapter on the blank page of tomorrow..... .....

THE CENTRAL CHRISTIAN ADVOCATE says there are few things more difficult than to manage persons who are always stirring up strife. They are rarely fully conscious of the effect which they are producing, and so take offense at the slightest intimation that they are not conducting themselves in the most Christian manner. They generally act as if they were on the defensive, and take to themselves the credit of forbearance. In fact, they are partly the victims of their own imaginations, and being of a suspicious character besides, they constantly provoke persons to resist their criticisms and encroachments on others' rights.....

BISHOP HUNTINGDON says that if the Church would have her face shine she must go up into the mount and be alone with God. If she would have her courts of worship resound with eucharistic praises she must open her eyes and see humanity lying lame at the temple gates, and heal it in the miraculous name of Jesus.....

THE N. Y. OBSERVER says that in imitating Christ we are to remember that we cannot copy his character in all its points; as, for example, his sufferings can never be ours, nor can we make an atonement for our own or others' sins. We cannot work miracles, nor become like Christ in his knowledge and power.....

WE cannot upon the other hand, take Christ as our example in the works of repentance and sanctification, for he knew no sin, neither was guile found in his mouth, and therefore, he had no need of repentance; he was always holy, and therefore cannot offer us an example of change of heart and of progressive sanctification.....

As it would be futile to attempt to imitate God in knowledge, and perhaps might lead to unholy pride, so it would be vain for us to attempt to imitate Christ in the peculiar attributes of his official character as Saviour and Mediator.....

AN INTERESTING ORIGIN.—Thatcher's Orange Butter Color was originated and perfected in the study of colors in grasses and traced to cream and butter with one of Beck's fine London microscopes.—*Adv.*

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

The poorest god that a woman ever worshiped is her own face. TALMAGE.

EXTRACTS FROM SUNDAY EVENING TALKS AT THE RURAL GROUNDS.

"A SOFT ANSWER turneth away wrath, but grievous words stir up anger." Prov. 15., 1.

My own faults and short-comings are brought to my notice so frequently and forcibly, and the imperative necessity of fighting them is impressed upon me so urgently, that when subjects of moral and religious moment are considered, my thoughts immediately turn "towards home."

This text has suggested itself to me a great many times of late. No one needs thoroughly to learn and fully to appreciate it so much as I. Naturally impulsive and quick-tempered, I am too apt to make the first reply that comes to my mind, and I am obliged to confess it is more often a "grievous word" than a "soft answer." At one time I fully believed that one "might as well *say* it as to *think* it." *Now*, I known that a hasty, harsh, cruel thought is far better unspoken, for the feeling which gives rise to such words dies away more quickly, and leaves not one half so much to regret. Moreover, one's thoughts do not cause pain or anger in another; whereas one's words may.

The truth of this proverb is apparent. Its practical bearing on things of every-day occurrence is evident. We all know that "least said soonest mended." Ah! if we lived up to it, how many unpleasant differences, fierce quarrels and broken friendships would never occur!

I recall two instances in Bible history, which enforce the truth of the proverb.

When Gideon's army of 32,000 men had been reduced to 300, and the army of the Midianites (his enemies) lay along the valley like grass-hoppers for multitude, Gideon was enabled, by his stratagem of trumpets and lamps in pitchers, to put the Midianites to flight. Then he sent messengers to the men of Ephraim on the mountain, saying, "Come down against the Midianites and take before them the waters unto Bethabara and Jordan." This the men did and on the way took two princes of Midian and slew them and brought their heads to Gideon on the other side of Jordan. The men of Ephraim said to Gideon, "Why hast thou served us thus, that thou calledst us not when thou wentest to fight with the Midianites? And they did chide with him sharply."

Gideon replied, "What have I done now in comparison of you? God hath delivered into your hand the princes of Midian, and what was I able to do in comparison of you?" Then their anger was abated toward him when he said that. "A soft answer turneth away wrath."

An incident in the life of David furnishes an instance of "grievous words" stirring up anger. Immediately after the death of Samuel, David with a few of his men went to the wilderness of Paran. Not far away there lived a very wealthy man whose name was Nabal. He and his wife are described thus: "Abigail was a woman of good understanding and of a beautiful countenance; but Nabal was churlish and evil in his doings." On a day especially appointed for feasting and giving portions one to another, David sent ten of his men to Nabal with this message, "Peace be both to thee, and peace be to thine house, and peace be to all that thou hast. And now I have heard that thou hast shearers; now thy shepherds which were with us, we hurt them not, neither was there aught missing unto them all the while they were in Carmel. Ask thy young men and they will shew thee. Wherefore let the young men find favor in thine eyes, for we come in a good day; give, I pray thee, whatever cometh to thine hand unto thy servants, and to thy son David."

Nabal said to the men, "Who is David? and who is the son of Jesse? There be many servants nowadays that break away every man from his master. Shall I then take my bread, and my water, and my flesh that I have killed for my shearers, and give it unto men whom I know not whence they be?"

When the men told David how Nabal had received his message, he was *enraged* and immediately started with 400 armed men determined to kill Nabal and all his servants. "Grievous words," etc. When Abigail was told by her servants how Nabal had replied to David and how David's men had protected them when they were keeping the sheep, she resolved to try to appease David's wrath. She gathered together a quantity of bread, wine, sheep ready dressed, corn, raisins and figs, and started out with her servants to meet David. When she came near to him, she bowed down and besought him to take no notice of Nabal's words, but to accept the food she brought for himself and his men. David received the offering, and said to her, "Blessed be the Lord, God of Israel, which sent thee this day to meet me: and blessed be thou, which hast kept me this day from coming to shed blood, and from avenging myself with mine own hand. Go up in peace to thine house." Her "soft answer" turned away his wrath; her husband's "grievous words" stirred up "anger."

CHERISH THE HOME-LIFE.

THE discussion of hired help in a recent RURAL, only touched lightly on one point—a point that many seem to think of little importance. It is the introduction very often of a totally inharmonious element into the home, when the hired man eats with the family of his employer. It may often seem a necessity; but a family that can be satisfied to have a succession of such men always at its board, has lost or never possessed

When Baby was sick, we gave her Castoria.
When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria.

the feeling that there is a sacredness in the home-life. Please understand at the start that I offer no disrespect to the many faithful, unobtrusive farm laborers whose principles and general conduct are above reproach.

A family cannot grow into unity of thought or feeling without some opportunity for its members to express their opinions and feelings fully and sympathetically. To busy people, meal-time is often the only time, for weeks in succession, when the family is together. The table talk can and should be such that there is an exchange of thought and experience between all the members of the family. The children will hear in school something of the questions of the day and at meal-time they can learn just what 'mother thinks" about them, and just how "father stands." But, supposing a workman sits at the table whose sympathies are known to be with the saloon men; would it be possible to enter into an argument with the hot-headed, out-spoken children on the burning evils planted and fostered by the saloons? It would be taking the man at a very unfair disadvantage and be striking him over the shoulders of the children if they were permitted to talk of the subject.

Children are sensitive to an antagonistic element, and will not express their thoughts freely in the presence of a man they cannot at all respect, and the parents thus lose the chance to learn the thoughts of their children, and lose the opportunity to shape them while they are not yet hardened into convictions. Without a knowledge of children's thoughts, older people make no impression upon them by their advice. A sympathetic atmosphere will bring out the questions and perplexities of child-life; but without it children will cover up everything belonging to the inner life with silence that is often unwholesome.

How many children there are who think as their school-mates do, as their teachers do, or as some older friend does, and scarcely know what their parents think on the same questions. There are not enough homes where unity is cherished and cultivated where there is, in any strict sense, a family life, a home-heart that pulses alike in every breast. This is the deepest loss that is insured when a family has no hour in the day for spontaneous and sympathetic talk. No man ought ever willingly to do anything that will make such an hour quite out of the question. I have known of families in which rough, ill-mannered hired men commented on every remark made by any member of the family in their presence, and whenever it was possible monopolized the talk. Such men would set little children the example of rising out of their chairs at table to help themselves to food beyond their reach, and then, of sinking back and devouring it with loud, smacking noises.

Some men bring with them to the table the odors of ill-smelling work and a noisome odor of dead tobacco fumes and perhaps of whisky, besides. The farmer who hires such a man, except under the severest pressure of work and scarcity of help, when he knows he must sit at the table with his family, ought to be made to swallow red-hot every dollar he gains by it. There are torture and slow starvation of minds, hearts and souls for the family of such a man, if they possess minds, hearts and souls to be tortured and starved. This is not an extreme picture, though I hope its like is not so common as observation would lead me to fear.

A hard-working man who by his work and frugality has risen from the position of hired man to be the proprietor of a thrifty little place, hired, one season, an evil, filthy, ill-smelling man, who was half-drunk or wholly so whenever he could obtain liquor, and placed him at the same table where he sat down with his neat, wholesome wife. Whether she made any sign of disapproval I do not know. But that man's thrift was base when it led to sharing the few minutes he could spend with his wife in the presence of such a man.

When it is the custom to seat the hired men with the family at table, a man's principles and his personal habits ought to be considered at least equally with his other qualifications as a farm laborer. The farmer has no moral right to offend his household by introducing into it a jarring, torturing element when it can be avoided. By one who realizes the value of the true companionship possible in a family some way will be made for its expression; if the table talk cannot be free and unhindered, some evening or a part of Sunday will be held sacredly in trust for the family life, for the development of the true home spirit. Too many children can say, in bitter truth, "Father never talks earnestly to me except when he has to punish me." Too many fathers do not know how to approach their children. Their busy lives have left them only a little leisure, and it has been spent over the newspaper or talking with neighbors, and the men are not acquainted with their own children. They find them grown up some day with ideas wholly at variance with their own on many subjects, and wonder bitterly why it is so, why the boys and girls hate the farm and call it a lonely, desolate place. A home on the farm is the place, if it is made so, for the most beautiful development of home-life; its isolation even gives the better opportunity for unity and harmony, and there is employment suited to every one if it is rightly shared. There are many homes where the home-life is strong and constant, and there will be many more as their beauty is felt and understood.

A. B.

Apropos of the article on "Woman," in the issue of March 9th, is the following, which is taken from the Lincoln Journal.

There were laughter and dancing at Hominy Hall,
And the ladies were happy—but gayest of all
The cook lady was as she frolicked around,
While the nurse lady scampered with panther-like bound;
The wash lady sat at ease in her chair,
While the lady who cleaned up the floors fixed her hair,
But, alas for their joy!—it was brief and short-lived,
For the woman whose servants they were had arrived.

"DOLINDA MIX."

A FARMER'S DAUGHTER'S DOMESTIC REVERIES.

CHARITY SWEETHEART.

"WELL, Charity, you're catching it. I declare I never knew I was such a good boy till 'A Man' took up my defense," said Burt, laughing and flourishing the RURAL. "Well, little sister, I deserve all you said and more too—and I should like a chance to knock 'A Man' down, if I am 'only a boy.' He would be a very nice house-mate I should think, to keep *nagging* that way. There's one thing, Charity, I think you *have* made a mistake in, and that is in waiting on me too much"—and with a kiss he went off, leaving me the paper. And I thought to myself that I was greatly to blame for the carelessness of the household, as Burt said, in not making them keep things in their places from the first. They were small when mother died, and we had to work so hard that I felt it was easier to pick up after them than to tell them to do it, and, of course, my authority was not very much to speak of, and so they grew up to think it didn't matter. When I first began to write for the RURAL, it was my *want* of culture that was commented on, and such derisive terms as are now applied to my small strivings after better things, are only amusing to us in the light of our very simple and homely surroundings. And it is the first time I ever knew it to be a subject for censure that one does not want a slaughter-house made just outside the kitchen door, with blood tracking in at every footstep, and the offensive *débris* in sight for a long time afterward. Why, in the city any man would be taken up by the police and fined for creating a nuisance, and I do not see why the country people should rebel against being as neat as their city neighbors in their home surroundings, when they modestly try to follow the city fashions in less important ways, with the very best of intentions.

In most country society it is a constant aim of the young folks, to resemble city people and the many squibs and caricatures of the awkwardness of rustic simplicity are very much resented. But it is of far more importance to have one's door-yards sweet and wholesome, for if we care not for these things, are we any better than the animals, calves, for instance? Our opponent knoweth not how high these pets of the barnyard stand in my estimation, or how natural it is to speak of them; for I have had to raise a good many of them by hand, and for years it was the only *culture* I knew, and having never been away from home to school (and Burt has) I cannot truthfully judge what the effect of a higher culture would have been. I should never imagine "A Man" knew anything about a sister's love even if he had not said so, for his sentiments lack a refining influence.

His writings amuse father very much, but he always ends by saying—"He's on the wrong track; isn't he Charity, my girl?" For father begins to realize now how few chances I have had for mental improvement, having alone all the care of the household, and he tries to make things easier somehow for me, and appreciates our improved surroundings.

I looked in the Floral History for the word marigold because if there is anything I despise it is one who *would* marry gold for gold's sake, and I wondered at the meaning of the flower. It was not so bad after all, the "fragrance being balsamic;" but the meaning cruelty—I leave to the readers to judge where it comes in. The poem reads:

"Thou art come to answer
A stony adversary—an inhuman wretch
Incapable of pity—void and empty
From every drachm of mercy."

Shakespeare wrote this, not marigold—and after all it doesn't really matter that "A Man" threw away the flowers—"what's one man's meat, is another's poison," all the world over, and there is one kind of marigold that is even useful, the petals of the flower being thought worthy as a seasoning "in the soup."

FOR STORMY DAYS.

I ONCE knew three children to play "Christmas-tree" for hours at a time, and day after day. They had a small, pretty pine fastened in a stool, and this they covered with their little playthings, picture books, cards, pretty caps, mittens, handkerchiefs, etc. Sometimes they hung on a little joke, as the stove handle for mamma, and the like. When all was ready, they held the song book up high, sang a few verses, and then stripped their tree. One dark, lonesome day, the tree was extra nice for "father" helped to trim it.

EAR-ACHE.

IF one of your little ones is troubled with the ear-ache, heat his pillow hot every night. This will often prevent a serious aching spell. When the poor ear really aches hard, toast a piece of bread, moisten it, bind it over the ear as hot as can be borne. Have a second piece ready as the first cools. Or, bake an onion without removing the outer layers; when soft, cut in halves; bind on the ear, having first wrapped it in soft cloth.

MRS. L. H. NILES.

ROLLS.

Two quarts of flour, one and a half pint of milk, one table-spoonful of lard, one-third cup of sugar, pinch of salt, one cake of compressed yeast. Rub the lard, salt and sugar through the flour. Dissolve the yeast in a little cold water. Warm the milk. Mix and cut out with a biscuit cutter, then roll each on one side so that it will be long enough to lap over. Put a small piece of butter under the part that laps over. Let rise two or three hours. This quantity will make 40 rolls.

MRS JENNIE DOWNE.

COLORING RECIPES WANTED.

I WISH that Mrs. Adelle Button would give to the RURAL readers her recipes for coloring cotton so that it will not fade. JENNIE W.

News of the Week.

AGRICULTURAL NEWS.

SATURDAY, March 23, 1889.

Seven per cent. is the legal rate of interest in Kansas, though 12 per cent. may be stipulated for in writing. There is a bill now before the legislature reducing the legal rate, and a number of persons and concerns that have been lending large amounts of money on bonds and mortgages are preparing to withdraw from the State, finding more profitable openings in other places. Farmers, the chief borrowers, think Eastern capitalists should be content with five or, at the most, six per cent. with good security, since it isn't easy to get safe investments paying even four per cent. at home .....Many object to the deductions drawn from the Minnesota Experiment Station's experiments with frosted seed wheat The seed sprouted all right in a green-house; but none of the plants eared. Under ordinary conditions it is held to be doubtful whether they would sprout as well and whether, if they did, the plants would not be too weak to withstand the hardships of the season and to mature full heads of plump, sound grain. It is held to be too risky to trust for so important a crop to such poor seed ..... Owing to his doctor's strong opposition, Professor Brewer, of Yale, who had accepted the office of Assistant Secretary of Agriculture, has been compelled to resign it. Ex-Governor Furnas of Nebraska and President Atherton of the University of Pennsylvania, declined the place, and now Professor Hillgard, of the Agricultural College of California, is the strongest candidate, being highly recommended by Professor Brewer and Senator Stanford of California.....The Illinois State Board of Agriculture has located the State Fair at Peoria for the next four years. It has elected Chief Clerk W. C. Gerrard, Secretary, in place of Col. C. F. Mills. It will offer $21,000 in prizes, or $3,000 more than in 1888..... The determination to boycott the binding twine Trust is spreading and hardening among the farmers of the West, among whom a strong agitation on the matter prevails. A big factory has been started at St. Paul, Minnesota, which, the telegraph tells us, "makes excellent binding twine from the fibres of common weeds" It is offered at 12 cents per pound against from 18 to 25 asked for manila. Last year while sisal twine was held by the manufacturers at 12 and 14 cents per pound one quarter inch rope made of exactly the same material, in the same factory, by the same machinery, was sold at eight to 10 cents per pound. At the close of the season, too, the unsold twine for which 14 cents has been demanded, was twisted into quarter-inch ropes which were sold for nine cents per pound in spite of the extra work! Few contracts have hitherto been made by either dealers or farmers..... Philadelphia and Germantown horse owners are denouncing the workings of the Pennsylvania Mutual Live Stock Insurance Company as fraudulent.....Cattlemen from all parts of the country attended the fourth annual meeting of the Holstein-Friesian Association in this city last Wednesday. The election of officers resulted as follows: President, Edgar Huidekoper; First Vice-President, G D. Wheeler; Second Vice-President, Jere Allis; Third Vice-President, John A. Fryl; Fourth Vice President, D. H. Burrell; Directors for two years, C. W. Hoer, C. R. Payne and M L Sweet; Treasurer, W. Brown Smith; Secretary and Editor, Thomas B Wales; Superintendent of Advance Registry, F. Hoxie. It was decided to hold the next annual meeting in New York on the third Wednesday of March, 1890. Fourteen new members were elected .... . The New York State Brewers' and Malsters' Association held its semi-annual convention here Wednesday. The brewers and malsters pledged themselves to give preference to hops grown in this State over those grown elsewhere, particularly in foreign countries; to buy New York hops from members of the county associations only; to encourage the growing of hops in this State, and to petition Congress to regulate the duty on foreign hops to protect home growers. The legal tare on a bale of hops is 3½ pounds. The Produce Exchange tare is seven pounds. It is proposed to enact by law a compromise tare of five pounds and then stick to it ..... It is proposed to join hundreds of large fruit houses throughout the country in a company which will have sufficient capital to buy the entire orange crop of Florida, and guarantee not only rapid delivery of the fruit in the markets throughout the country, but also insure a uniform quality of the fruit. The company will send a representative to Florida about September to inspect the groves and advance not more than 75 per cent. of the value on three-quarters of the estimated crop of each grove, as security for which they will take from the grower an iron-bound contract for delivery of the fruit at a large packing-house, which they propose to build at Sanford, Fla. The fruit will be shipped to this point in car-loads, where it will be carefully selected and packed according to its quality. It is proposed then to distribute it by fast freight trains throughout the country, and negotiations are now pending with the Pennsylvania Railroad Company for an efficient train service for this purpose. If such an association is formed for the sale of oranges, why shouldn't it advantageously handle peaches and other fruits also? But isn't there some risk of danger to producers from such a combination of middlemen? .... The New Secretary of Agriculture, General Rusk, was married at the age of 18 to Mary Martin, by whom he had three children, before her death shortly after the removal of the family to Wisconsin. In 1856, he married Elizabeth Johnson by whom he has had four children, two of whom are living..... ..... Owing chiefly to intense competition between themselves and hard collections from their victims, an unprecedentedly large number of the money-lending Shylocks of Dakota and Nebraska are coming to grief. Every fellow with from $2,000 to $5,000 in ready money has found little difficulty in making a living by lending it in small sums to distressed farmers, and eventually many of these usurers have become owners of everything within reach; but the "business" seems to have been overdone.... ..... A Farmers' Alliance meeting at Des Moines, Iowa, last week, recommended to farmers of the Northwest three things, anent the binder-twine Trust: First, to change their binders into harvesters with platforms for hand-binding; second, to change self-binders into headers; third, to curtail the out-put of small grain whenever experience shows that there is a doubtful profit.. Mr. Rockwood of Wisconsin, Editor of the State Gazette, Portage City, has been selected Chief Clerk of the Department of Agriculture.....

Dr. Jekyll and Mr. Hyde.

Since that delightful author, Mr. Stevenson, has so suggestively written of Dr. Jekyll and Mr. Hyde we find ourselves holding our natures in closer regard, and we discover other lurking Hydes to mar the sweetest disposition and turn the most earnest and direct of us away.

Disease takes up its residence in us and developes into the most malignant and destructive of lodgers, cruel, obstinate and defiant. We will not recall the various and expensive expedients to which you have vainly resorted in the desperate endeavor to expel this obnoxious tenant, but briefly call attention to a most effective agent to drive away the vandal Hyde.

We refer to Compound Oxygen already well-known to be curative and restorative to that delightful degree so long sought by the invalid, as the following would indicate:

ATLANTA, GA.

"I still recommend your remedy to my friends who are afflicted, and why should I not? It saved my wife's life and cured my boy of catarrh." WALTER F. FORBES.

ALMA, NEB., Feb. 13, 1888.

"I do unhesitatingly say, Compound Oxygen will cure catarrh."

HON. H C. GRIFFITH.

MEDIA, PA., July 3, 1888.

Compound Oxygen is better in the house than the best physician. A. S. BROWN.

LEAD CITY, DAK., April 24, 1888.

"I feel that the Home Treatment is doing me great good, in fact I am confident that it invigorates every function."

REV. J. B. WHALING.

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery St., San Francisco, Cal. —*Adv.*

The Kodak.

PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be re-loaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker.

DO YOU WANT TO BUY A
FIRST-CLASS JERSEY BULL CALF?
—IF SO, APPLY TO—
MILLER & SIBLEY, Franklin, Pa.

The youngsters are sired by the following Bulls: **Michael Angelo, 10116,** cost $12,500 cash, when six weeks old. Represents the full blood of his dam, **Eurotas,** who made 778 pounds of butter in 341 days on moderate rations, and dropped a living calf 359 days from the beginning of the test. **Ida's Rioter. of St. L., 13656,** inbred son of Ida of St. Lambert. Official butter test, 30 pounds 2½ ounces in seven days. **Stoke Pogis 5th. 5987,** sire of six young cows; testing from 14 pounds 1½ ounces to 22 pounds 12 ounces of butter in seven days. Full and only living brother of Stoke Pogis 3d, now dead sire of 27 cows, averaging over 20 pounds of butter apiece per week. Almost full brother to Matilda 4th. **Matilda 4th's Son. 20214,** by Ida's Rioter of St. L., 13656, out of Matilda 4th, 12816, who made 73 pounds 1½ ounces of butter for January, the tenth month after calving, and undoubtedly made over 950 pounds of butter during the year. No bull calf sold for less than $100. You cannot afford to use a cheaper one.

Write for what you want. No general catalogue. Mention this paper.

Literary.

THE DRUM LAKE EASTER SERVICE.

A story of the Michigan Pine Woods.

BY HERBERT W. COLLINGWOOD.

Copyrighted by the Rural New-Yorker.

(ALL RIGHTS RESERVED.)

"TAKE hold of this woman with me Bill," said Jack. "An' you, Parson, take this revolver and foller. Ef a man touches one of us—shoot him."

The two men raised "Sarcy Sal" from the snow, and carried her carefully, almost tenderly, to her own house. The minister followed with the revolver in his hand. He would have used it if necessary. The crowd fell back, and in a short time dispersed.

Silently they carried the woman into the pretty little room, and laid her on the bed, while the Parson stood looking wistfully at her.

"Come, Bill," whispered Jack, as her eyes opened at last, "this ain't no place fer us, leave Parson in here alone." Jack and Bill stole away, and left the Parson and "Sarcy Sal" together.

I cannot tell what happened during their interview, I only know that when Jack Gray came back at last, he found the woman lying dead; the minister with his face buried in the pillow and his hand clasped in hers.

And so, holding fast to the hand of the one she had wronged, as a little child might hold its father's hand, the soul of the wretched woman, freighted with all its sin and shame, had drifted away.

"Come, Parson," said Jack kindly, as he touched the little man's shoulder. "Ye'd better go now an' let the wimmin folks do all the rest."

"I think I will," said the minister as he walked slowly to the door. "I think I will." He gave one last look at the dead woman, and then went softly out.

Something on the floor where the minister had been kneeling caught Jack's eye. He bent down and picked up a long golden curl. He laid it by the head of the dead woman; they were exactly alike.

"The Parson must hev knowed her afore," muttered Jack, as he walked to the window. "It beats all. *I'll* keep it now," and he thrust the curl into his own pocket.

The minister walked unsteadily into Mrs. McKelvey's kitchen and sat down in his old place by the fire. Mamie had cried herself to sleep. She lay on Mrs. McKelvey's bed, with her arm thrown over the baby's neck.

The Parson did not care for dinner. He wanted rest, he said. At last, he rose wearily to go to his own room to try and sleep a little.

He stopped at the door to ask, "You will take care of the little girl; won't you, Mrs. McKelvey?"

"In course, I will, bless' er dear little 'art." She wanted to say more, but the tears stopped her.

Late in the afternoon, Mr. McKelvey knocked at the minister's door. There was no response, and the visitor pushed the door open. The Parson sat in his chair as if asleep. He was asleep, but it was "the sleep that knows no waking." All Drum Lake wondered what killed him. They never could tell, but Jack Gray and Mrs. McKelvey might have told.

They were buried together. Jack and Mrs. McKelvey took charge of the funeral, which was held in the old "audience room" where the Parson's mottoes still clung to the wall.

The minister from Frenchtown came over to preach the sermon. He spoke eloquently of the Parson, and of the great hope before him, but he left the woman with a shudder, to her fate. He did not believe that the minister's hand had held hers all of the way. But after the funeral, in Mrs. McKelvey's sitting-room, when little Mamie came to him and said, "I know I shall see my mamma again," he muttered: "Out of the mouths of children cometh the truth."

Drum Lake came in a body to the funeral. One by one, the people passed by the rude coffins, and looked at the dead. How death had changed them! It had purified the woman. The coarse, brutal look was gone, and only the sweet, tender face remained. It had made the man strong. All the old feebleness and melancholy had passed away, and he was smiling as if the "wondrous good" had come to him at last.

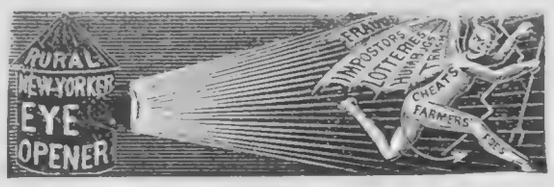
Jack Gray and Jim Foster walked away together.

"I say, Jim, what a terrible pretty woman she must have been in her day."

"Yer right, Jack, but what a fool *he* was."

And so Drum Lake decided his place. Perhaps Jim was right. Perhaps he was a fool, and yet poor, little fool, he "knows the secret that men die to win." He knows it, but he cannot teach us. His lips are sealed. We can only learn it as he has learned it—in the "old, old way." May we be as well prepared.

(THE END.)



REPORTS from several rather widely separated parts of the West indicate that several parties are simultaneously practicing the same swindle upon farmers. Probably they are members of the same "gang," or it may be that, having heard of the fraud, they are all practicing it each on his own hook, independently of any one else. The nature of the scheme is well illustrated by the doings in Webster county, Iowa. A short time ago a respectable-looking, elderly man appeared in different townships for the purpose, as he alleged, of purchasing horses for an Omaha firm. While horses and cattle are the objects which the rascals usually pretend they wish to buy, they occasionally say that they want pigs, or sheep or even wheat, corn or oats—whatever, indeed, the farmer may have most of for sale. Well, that Webster county sharper usually bought one or more horses from every farmer he visited, giving fine prices even for old, broken down animals, always tendering in payment a check signed by the Omaha firm and payable at an Omaha bank. To prevent the possibility of any loss to the farmers, he told them to get their checks cashed before he removed the horses, and to enable them to do this and also to give him time to collect all his purchases in the neighborhood, he would allow those he had bought from each farmer to remain where they were for a few days. Just before leaving, he invariably turned to the farmer and, in an-off-hand, matter-of-course way, said that as the farmer had the horses and the price for them, it would be well for him to pay something—just enough to "bind the bargain." This was invariably done, the stranger getting from each from 50 cents to a couple of dollars. Of course, the checks were never paid, inquiry at Omaha disclosed the fact that no such firm existed there, and the "respectable-looking" old sharper never claimed his purchases. Investigation showed that he had bought horses from 10 to 12 different persons a day, so that though the amount he got from each was small, his rascality netted him a pretty snug income in the aggregate. This "game" can be easily "played" in any part of the country, and with any agricultural product as well as with horses, substituting for Omaha the name of some other town a moderate distance away.

IN the RURAL of February 18, 1888, the Eye-Opener denounced the dishonest practices of "Dr." H. A. Eberle, of Kansas, who was in the habit of obtaining from patients notes for which he promised not to ask payment until a cure should be effected. Then he used to sell the notes, and neglect the patients. He is supposed to have realized over $50,000 in this way. We see from several Kansas papers that the fellow has just been arrested for fraudulently obtaining money under false pretences. Several Kansas friends have written to us commending our exposure, which preserved some of them from imposition.

IT has just been decided by the Supreme Court of Michigan that a note given in payment of Red Line Wheat where the conditions were not fulfilled, cannot be collected, as the whole transaction was tainted with fraud. This Red Line Wheat business is conducted in precisely the same way as the Bohemian Oat swindle. The law relating to one must be applicable to the other therefore, and to all frauds of the same stripe.

A FAMOUS BATTLE-GROUND.

ON the banks of the Tippecanoe, a small stream which enters the Wabash River in Indiana, was fought the terrific battle of Tippecanoe.

In this great struggle of frontier times, the allied western Indians under the chieftainship of Elskwatawa, the "Prophet," were defeated in November, 1811, by the Americans under the command of Gen. Wm. H. Harrison.

It was a desperate, hard-fought battle, and much depended upon the result.

Had the Indians been successful, all barriers of defence for the early settlers would have been overthrown and the deadly tomahawk would have been active in the rapid extermination of the remaining pioneers. On the other hand, the fortunate termination of the contest put an end to further attempts at open warfare by the Indians. The rich territory, so long overrun by hostile savages, was thrown open for settlement, which rapidly occurred as soon as the news of the great victory became widespread.

Naturally, great praise was rendered to the success and intrepid bravery of Gen. Harrison and he was honored in many ways. He afterwards served as commander of the Army of the Northwest, and when Indiana was admitted to statehood, he was selected to represent the State in the United States Senate. In 1840 he was elected President and his unfortunate demise occured shortly after being inaugurated.

The forty-second anniversary of the Battle of Tippecanoe found the gallant grandson of "Old Tip" leading his forces to a great political victory which resulted in the selection of Gen Ben. Harrison as President of the United States.

TheHarrisons have been a hardy race of men, sprung from old log cabin stock, which is sufficient guarantee of its genuineness wherever found. Realizing the truth of this, great effort has been made to re-discover some of the secrets contained in the old log cabin stock of useful articles, and as the result, the famous Old Log Cabin Sarsaparilla, universally regarded as the best Spring tonic and blood cleanser has been found. Not satisfied with the world-wide esteem which is held for Warner's Safe Cure, the only cure for kidney diseases, the proprietor is willing to do all that is possible to establish Warner's Log Cabin Sarsaparilla as foremost among household articles on account of its purity and effectiveness.

After all, each individual has at all times, the great battle of life or death to fight, and for security attention must necessarily be given to the best weapons which science can offer humanity in the great contest.

CATALOGUES, ETC., RECEIVED.

HOLSTEIN-FRIESIAN CATTLE.—Catalogue from Smiths, Powell & Lamb, Syracuse, N. Y.—It is always a pleasure to examine this catalogue. It is of neat and handy size, well printed and arranged and full of interesting facts for breeders and dairymen. The "Lakeside" cattle have won numberless prizes for superiority as milk and butter animals, and their performances in the prize ring have done much to build up the marvelous popularity the breed now enjoys. Last week we gave an account of the feeding experiments recently conducted at the Michigan Agricultural College. These experiments showed the great value of the Holstein steer for beef. We can assure our readers that they can buy the best Holsteins to be had at the Lakeside farm.

AGRICULTURAL IMPLEMENTS.—Catalogue from the Belcher & Taylor Agricultural Tool Company, Chicopee Falls, Mass. Here we have a well-prepared list of excellent tools. There is a good selection of hay, straw and ensilage cutters, with the celebrated "Lion" cutter at the head. Vegetable cutters and corn-shellers of various styles are offered and also a variety of plows, harrows and cultivators. A swivel plow, a subsoil plow and a shovel plow, just right for trenching for potatoes, are features of this catalogue. A good hand potato-planter is pictured. This is an excellent house to deal with.

ERTEL VICTOR BALING PRESS.—Catalogue from George Ertel & Co., Quincy, Ill. When a farmer proposes to spend his money for a high-priced implement, it behooves him to know what he is buying. There are different hay presses on the market, and one of them must be better suited than others to perform the particular work required on each farm. It is therefore well to investigate the merits of the various presses. If one can see them in operation at the fairs, well and good; but it is well to know before you go to the fair what good points are claimed by the makers. A circular or catalogue of this kind is understood to be a special plea, in which are packed all the virtues the maker can think of. Read this catalogue with this understanding and when you see the press, notice how true the claims are.

INITIAL TOE PAD.—Price-list and catalogue from the Initial Toe Pad Company, Three Rivers, Mich. This company has made a specialty of the manufacture of carriage panel protectors. Their success has been remarkable, and now many leading carriage manufacturers who formerly made their own toe pads have stopped making them, finding it cheaper to buy of this house. It is safe to say that for beauty and utility these pads are unequaled.

EXPANDED METAL.—This is a "new thing" decidedly, and it seems like a novelty of very decided merit. A circular is sent by the Central Expanded Metal Co., 116 Water Street, Pittsburgh, Pa., which is certainly unique and interesting. "Expanded metal" is sond metal pushed out or expanded into diamond-shaped meshes by mechanical process. A narrow hoop of brass or other metal is first cut and then pushed and pulled apart something in the manner of the paper designs we used to see in the old-fashioned kitchens. It is a most ingenious contrivance, and makes a strong, light and cheap material for fences, gates, window guards, doors, trellises railings or plastering lath. This is something that will repay an investigation. Send for this circular.

B. A. ELLIOTT & CO, PITTSBURGH, PA.—A magnificent work of 120 pages entitled "A Few Flowers Worthy of General Culture," being an effort to win for hardy plants a recognition of their great wealth of beauty. This is the sixth edition. A more elegant treatise is nowhere published. The paper is heavy and super-calendered; the illustrations are among the best. We commend the work unqualifiedly to the attention of our readers.

GEO. A. BONNELL, WATERLOO, SENECA COUNTY, N. Y.—A first-rate list of potatoes; also a selected list of vegetables.

KENDALL & WHITNEY, PORTLAND, MAINE.—Catalogue (100 pages) of garden and flower seeds.

W. H. CORNISH & COMPANY, NEWBURGH, N. Y.—"History of the Potato," "Cultivation," "How to Plant an Acre with One Potato," "How to Store and Keep Potatoes" are among the topics with which the catalogue opens. It offers a new field corn and the claim is made that it has the largest grain and smallest cob of any yellow flint ever offered. The ears are eight-rowed and often 15 inches long.

F. S. EAGER & COMPANY, NEWBURGH, ORANGE COUNTY, N. Y.—A descriptive catalogue of vegetable, flower, grass and clover seeds.

LEWIS ROESCH, FREDONIA, N. Y.—Descriptive list of grape vines and small fruits. A colored plate of the Moyer grape.

JOHN S. COLLINS, MOORESTOWN, BURLINGTON COUNTY, N. J.—A catalogue of small fruits, grape vines, large fruits, mulberries, persimmons, nut trees, etc.

FREDERICK LUDLAM, 182 FRONT STREET, N. Y.—A little book which sets forth in an original way the fertilizers which Mr. Ludlam offers for sale.

M. B. FAXON, No. 21 SOUTH MARKET STREET, BOSTON, MASS.—This is a very neat catalogue the aim of which seems to be to reduce the long list of flowers and vegetables to those of the best well-known, tried sorts. Mr Faxon's specialties are printed in red ink, occupying eight pages.

EDWIN ALLEN, NEW BRUNSWICK, N. J.—A select list of fruit and ornamental trees.

J. W. HALL, MARION STATION, SOMERSET COUNTY, MD.—A list of "high-bred seed potatoes."

ELLWANGER & BARRY, ROCHESTER, N. Y.—A catalogue (No. 2) of ornamental trees, shrubs, hardy perennial plants, etc., The R. N.-Y. offers its assurances to its readers that there is no other nursery firm in this or any other country more enterprising or trustworthy. This catalogue is conservative, terse and explicit. There is no foolishness or humbug about it.

No. 4, also issued by E. & B. is a wholesale catalogue of fruit trees, small fruits, etc.

No. 1 is a descriptive catalogue of fruits, with a colored plate of the Mills grape.

G. D. HOWE, NORTH HADLEY, HAMPSHIRE COUNTY, MASS.—A potato manual of 75 pages. Mr. Howe offers about every variety of potato known at present. On page 16 a resumé of the R. N.-Y. Trench System is given.

QUINNIPIAC COMPANY, NEW LONDON, CONN.—A pamphlet setting forth the value of the fertilizers made by this favorably known firm. Most of their fertilizers are put up in not only 200-pound bags, but in bags of 100-pounds, and in 50-pound bags. They also offer the chemicals separately.

SILO AND SILAGE.—This is the title of a little pamphlet published and sold by Prof. A. J. Cook, Agricultural College P. O., Michigan. It is intended to serve as a silo primer—not so much for those who have proved the value of the silo, but for those who ought to use it, but have not yet been able to see the economy and value of ensilage. We do not hesitate to say that this little book is the most likely to arouse a spirit of investigation among those who *ought* to use the silo that we have ever read. The story is told in a plain, straightforward manner, and there is plenty of evidence that the author is not a theorist, but one who has actually handled and fed silage and computed its comparative cost. The book sells for 25 cents and is well worth that sum to one who desires to study this important subject.

HARROW PAMPHLET.—This volume is sent by the Herendeen Manufacturing Company, Geneva, N. Y. It contains excellent illustrations and descriptions of the tools made by this company. A short essay on the treatment of heavy clay lands is very readable The Thomas harrow is the "Star" of this combination. Better send for this pamphlet and prepare yourself for the fine symposium in the cultivation of young corn and potato plants, that we are to give next week.

GARRETT FENCE MACHINE.—Circular from S. H. Garrett, Mansfield, Ohio. This circular is packed full of facts bearing upon the value of the fence made by the Garrett machine. It is claimed that this fence is superior to those made from barbed wire, hedge plants, rails or planks. The pamphlet presents a list of 18 advantages claimed for this fence and the directions are very complete indeed. It is a very good circular, well calculated to advertise the machine.

H. J. BAKER & BRO., 215 PEARL STREET, N. Y.—A manual, in the form of a pocket-book, of the fertilizers made by this firm. It is an excellent firm and our friends may safely intrust it with their orders.

VAUGHAN'S CELERY MANUAL, BY J. C. VAUGHAN, CHICAGO, ILL.—This gives a full and practical account of celery culture, from starting the seed to shipping the plants. It is also well illustrated. It is a little book of 39 pages. We would call attention to the picture of a "winged" shovel plow on page 18. This is the plow the R. N.-Y. uses to dig its potato trenches for field culture.

GEO. W. CAMPBELL, DELAWARE, O.—A descriptive list of grapes and small fruits. Mr. Campbell is everywhere known as a high authority. He regards the Woodruff Red as the most promising new grape.

AMES PLOW COMPANY, BOSTON, MASS.—Notice is given by this company that they have extended the time on their "special offer" of corn planters until April 12. This was done to accommodate readers of our Corn Special.

MASSACHUSETTS HORTICULTURAL SOCIETY.—The Transactions of this society are sent by Robert Manning, Boston, Mass. We consider this the most interesting volume ever presented by this society. A number of timely topics are intelligently discussed and the discussions bring out a vast amount of valuable information.

NOVELTY STEEL HARNESS.—Catalogue from the Sherwood Harness Company, Syracuse, N. Y. This harness has been before the public for several years and has steadily grown in public favor. There are hundreds of good farmers who regard it as one of the most remarkable labor-saving devices that have been perfected of late years. We are using this harness at the RURAL's New Jersey farm. Mr. Sherwood, the inventor of the harness came to the farm and gave a practical test. We have used the harness, before the plow and also before the wagon. We can only say that we shall never use any other harness for plowing, harrowing or similar work. We believe the horses can do more work with the Sherwood harness than they can with the old arrangement and the time saved in turning and keeping the horses inside of the traces is considerable. In our opinion, the farmer who secures a set of this harness will be thankful.

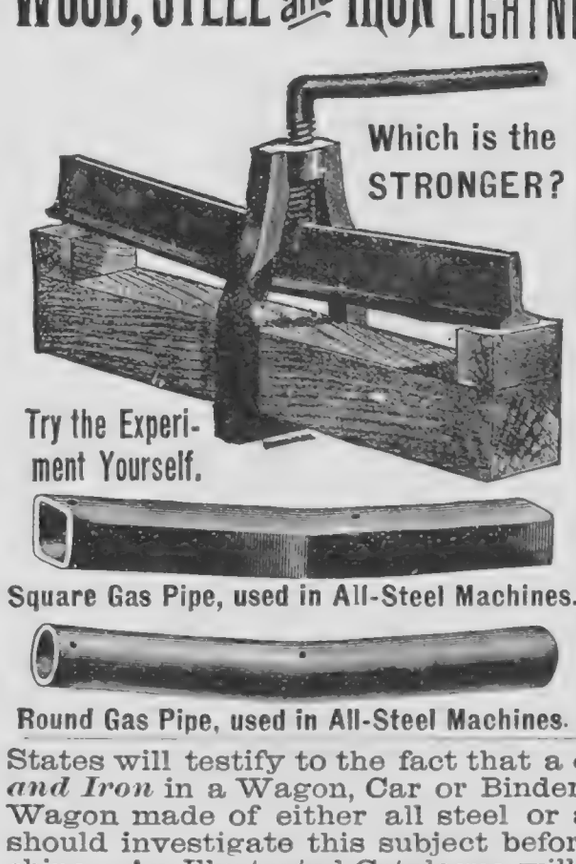
Prices moderate, terms easy. Correspondence solicited. Send for Catalogue No. 9.

THERE IS NO ALL STEEL CHESTNUT ABOUT THE **BUCKEYE BINDER**

EXPERIENCE HAS DEMONSTRATED THAT WOOD, STEEL and IRON ARE THE THREE ESSENTIAL ELEMENTS OF **LIGHTNESS, DURABILITY and STRENGTH.**



ALL OF THESE ARE COMBINED IN THE **BUCKEYE.**

Place a piece of Ash such as is used in the Buckeye in a clamp along with a piece of Steel of equal length, such as is used in All-Steel Binders. Let the *Steel weigh just twice as much as the Wood,* and yet the steel will invariably yield and bend as the pressure is brought down. The wood will scarcely get out of line, and when the clamp is removed, it will spring back to its original shape. Not so with the steel, which bends and remains bent. An All-Steel Machine coming in contact with an irresistible obstacle, will bend its frame, or loosen the bolts and nuts. When this is done, its usefulness is at an end. Every leading manufacturer of Wagons and Cars in the United States will testify to the fact that a *combination of Wood and Steel and Iron* in a Wagon, Car or Binder is better than a Binder, Car or Wagon made of either all steel or all iron. The intelligent farmer should investigate this subject before purchasing a Harvesting Machine. An Illustrated Catalogue will be sent free to all who address **AULTMAN, MILLER & CO., AKRON, OHIO, U.S.A.**

BREED'S UNIVERSAL WEEDER and CULTIVATOR

For Weeding and Cultivating all hoed crops. For putting in Grain and Grass and Hungarian or Millet it has no equal. Every farmer should inquire into its merits. Ex-Gov. ROBIE, Master Me. State Grange, writes: "It should be owned by every farmer in the country." Send postal card for circulars and testimonials. All parties in Middle States should address BROWN MFG. CO., 40 DEY ST., NEW YORK. All others UNIVERSAL WEEDER CO., North Veare, Hillsboro Co., N. H.

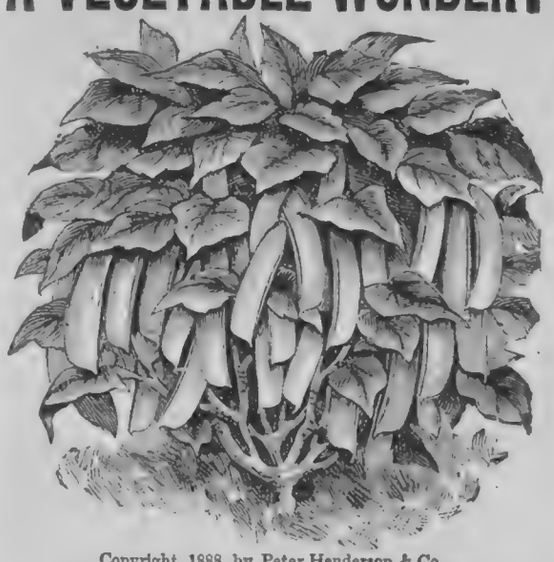
LEHR BROS, - - Fremont, Ohio.

A VEGETABLE WONDER!



Copyright, 1888, by Peter Henderson & Co.

HENDERSON'S NEW BUSH LIMA BEAN

Can and Should be Grown in every Garden on the Continent.

Of all the *Novelties* in *Garden Products* ever sent out, there is nothing so entirely distinct and valuable as this *New Vegetable.* The old Lima Bean can only be grown on poles, while the *NEW BUSH LIMA* grows and is cultivated exactly like the common bush or snap bean (growing only 18 inches high), and from the time of its bearing in July, produces in abundance delicious Lima Beans throughout the entire season until frost. It has, besides, an additional value, in that it is *two weeks earlier* than any other Lima Bean, being fit for the table in from 40 to 50 days from time of planting.

Price (by mail) 25 cents per packet, 5 packets for $1.00, 12 packets for $2.00. 12 packets sufficient for an ordinary-sized family for the season). Directions for growing on each packet. Remittances can be sent either by Post Office Order, Postal Note or Stamps.

Every purchaser of *Henderson's Bush Lima Bean* will be sent, *without charge,* our MANUAL OF EVERYTHING FOR THE GARDEN, a book of 140 pages, size, 9 x 11, containing 3 colored plates (the price of which is 25 cents), *on the distinct understanding,* however, that those ordering will say in what paper they saw this advertisement.

Our Handsome **Illustrated Catalogue** contains a fund of useful information and is free on application. Send for it.

Magnificent Collection of **FLOWER SEEDS**

200 Varieties, FREE!

An Unparalleled Offer by an Old-Established and Reliable Publishing House! THE LADIES' WORLD is a mammoth 16-page, 64 column illustrated paper for ladies and the family circle. It is devoted to stories, poems, ladies' fancy work, artistic needlework, home decoration, housekeeping, fashions, hygiene, juvenile reading, etiquette, etc. We want 100,000 ladies to give this elegant paper a trial, because we know that a very large proportion of them will like it so well that they will become permanent subscribers. With this object in view we now make the following *colossal offer: Upon receipt of only* **12 Cents** *in silver or stamps, we will send* **The Ladies' World** *for* **Three Months,** *and to each subscriber we will also send,* **Free** *and post-paid, a large and magnificent* **Collection of Choice Flower Seeds,** *two hundred varieties,* including Pansies, Verbenas, Chrysanthemums, Asters, Phlox Drummondii, Balsam, Cypress Vine, Digitalis, etc., etc. Remember, twelve cents pays for the paper three months and this entire magnificent collection of Choice Flower Seeds, put up by a first-class Seed House and warranted fresh and reliable. No lady can afford to miss this wonderful opportunity. We guarantee every subscriber many times the value of money sent, and will refund your money and make you a present of both seeds and paper if you are not entirely satisfied. Ours is an old-established and reliable publishing house, endorsed by leading newspapers throughout the U. S. Do not confound this offer with the catchpenny schemes of unscrupulous persons. *Write to-day*—don't put it off! Six subscriptions and six seed collections sent for 60 cents. Address:
S. H. MOORE & CO., 27 Park Place, New York.

PROF. SEMMOLA, of the University of Paris, in an article published in the Gazette Medicale de Paris, says: "Dryness of the skin, imperfect digestion and transformation of albuminoid food are present at the beginning of chronic Bright's Disease." Warner's Safe Cure removes digestive disorders. Why? Because it enables the kidneys to perform their functions in a healthy manner, when both cause and resulting symptoms disappear.

New and Choice Field Corn

FIELD OF ORANGE COUNTY FIELD CORN.

This new Corn is entirely distinct from all other varieties, having the largest grain with the smallest cob of any Yellow Flint Corn ever offered. The kernels cover the end of the cob, in fact topping it over. The ears are eight-rowed, and about 15 inches long. We have compared it with all the leading Yellow Flint varieties, such as Longfellow, Angel of Midnight and Compton's Early, and find it much superior to any of these, in its immense yield. The stalk is strong and large, of medium height, three ears to the stalk being not uncommon, and during the past season the remarkable yield of 150 bushels was produced from one acre.

Send for our Catalogue of 1889, free to all.

W. H. CORNISH & CO., Newburgh, N. Y.

New Sweet Pea, 'Nellie Janes.'

PURE PINK AND WHITE, NEARLY TWO WEEKS EARLIER THAN MOST sorts, a most profuse bloomer with long stem. Continuing in flower until the late frosts; from two to four blossoms on a stem. Have cut by actual count over 500 blooms from one plant in sixty days and 6,000 in one day from a row 200 feet in length. IT HAS FOR THE LAST FIVE YEARS PROVED TO BE THE BEST-SELLIN SORT IN CHICAGO. Although not a novelty, this is the first time seed of this sort has been offered for sale. Mr. Janes, who named it, has raised this sort for the last five years, and no inducement, however great, could prevail upon him to dispose of any seed to his competitor. Knowing the superior qualities of the "Nellie Janes," we have secured his entire stock at an enormous price. We send our new catalogue and one packet of this seed for 25 cents; 3 for 60 cents.

VAUGHAN'S SEED STORE
146 & 148 W. Washington St., Chicago.

850,000 GRAPE VINES

100 VARIETIES. Headquarters of the **MOYER,** the Earliest and Best. Reliable Red Grape now first offered under seal. Also Small Fruits, Trees, Etc. 3 Sample Vines mailed for 15 cents. Illustrated descriptive Price List free. **LEWIS ROESCH, FREDONIA, N. Y.**

THE MAPES CORN MANURE.

600 to 800 lbs per acre broadcast on poor, thin "Plain" lands in Connecticut and Massachusetts have not only produced paying crops from the start, but with annual applications of the Mapes Manures, at the end of eight years of successive paying crops of Corn, Potatoes, Oats and Grass, the land found to be in condition equal to the average best lands.

Restoring Worn-out Lands.

The editor of the American Agriculturist states February, 1887:

"Our own experience has convinced us that with judicious use of the MAPES MANURES, WORN OUT LANDS may be restored to fertility QUICKER and WITH LESS EXPENSE, than in any other way."

The editor of the Massachusetts Ploughman states March 21st, 1887:

"Poor land treated with the MAPES CORN MAMURE can be economically and profitably brought into good condition for PERMANENT GRASS land. The land, so treated after each crop is taken off, is in better condition than it was before. The Mapes Corn Manure improves the land.'

Official Analysis by the Connecticut Agricultural Experiment Station, 1888:
AMMONIA, 4.65 per cent. PPOSPHORIC ACID, SOLUBLE AND AVAILABLE, 9.46 per cent. PHOSPHORIC ACID, TOTAL, 12.92 per cent. POTASH, 6.08 per cent.
The average of the analyses of this manure for six years past by the stations of Conn., N. J., Penn. and Mass., have been fully as high as the above. No other manure made equals t in strength.

SOLD ON A DOUBLE GUARANTEE. HIGH ANALYSIS.

No Rock, Iron or Alumina Phosphates used. No Horn, Leather or any inferior matter.

SOME LARGE CROPS GROWN WITH THE MAPES CORN MANURE AND REPORTED IN THE AGRICULTURAL PRESS.

90 bushels (shelled) with 500 pounds per acre. 150 bushels (shelled) with 600 pounds per acre. Value of the grain alone over five times as much as the cost of the fertilizer—AMERICAN AGRICULTURIST.

856 bushels (ears) on four acres. 159.37 bushels of shelled corn ON ONE ACRE. 125.37 bushels ON ONE ACRE. Nothing used but the Mapes. RURAL NEW-YORKER.

On two acres 600 pounds of Mapes, alone, broadcast, 198 bushels shelled corn.

On three acres, same fertilizer, same quantity, 489 bushels ears.—NEW ENGLAND HOMESTEAD.

180 bushels of ears per acre; shelled, 98.45 bushels. 2058 bushels ears on 16 acres. Only Mapes (800 pounds per acre) used.—CONNECTICUT FARMER.

Season 1888. 1040 bushels of corn (ears) on less than 4 1-2 acres, equal to 233 1-2 bushels or 116 3-4 bushels shelled corn per acre, grown on farm of Rural New-Yorker. (See pamphlet 1889, sent free).

The Mapes Corn Manure may also be used on Sweet Corn, Corn for Ensilage, Fodder Corn, Hungarian Grass, late Turnips, Cabbages and Seeding to Grass.

Send postal for Book, for Reports, Rules, etc., in Prize Crop Competition. American Agriculturist and the Mapes Company. THOUSANDS OF DOLLARS IN PRIZES for best acre POTATOES, CORN, OATS and WHEAT. SEASON 1889. Address

THE MAPES FORMULA & PERUVIAN GUANO CO., 158 Front St., N. Y.

Special attention to low freight rates to consumers where we have no agents.

$2.50 will Buy a Pair of the Best KIP BOOTS

FOR FARMERS EVER PLACED ON THE MARKET.

You can get them through any Country Storekeeper in any State or Territory.

JAMES MEANS' Quarter Eagle Boot

(Trade Mark.)

A RELIABLE KIP BOOT FOR FARMERS.

10 Mills make one Cent:
10 Cents make one Dime;
10 Dimes make one Dollar;
10 Dollars make one Eagle,

And with a Quarter Eagle any Farmer in the Country can now buy a boot that will satisfy him. Farmers have been looking for such a boot for a long time and now it has come.

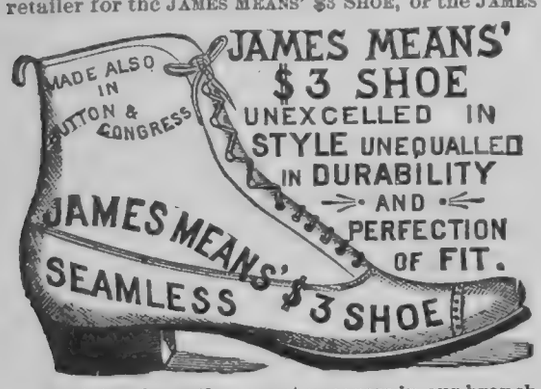
TO COUNTRY STOREKEEPERS: If you invest $20 or $30 of your capital in our **James Means' Quarter Eagle Boots** for farmers, that amount of money will enable you to carry a complete assortment of sizes of our boots in your stock so that you can fit any farmer. You of course desire to attract new customers to your stores. Your customers want you to sell these boots, and you cannot afford to disappoint farmers when they come into your store and say: "I want a pair of the **James Means' Quarter Eagle Boots.**" Send to us for wholesale prices. "A word to the wise is sufficient." **Are you wise?**

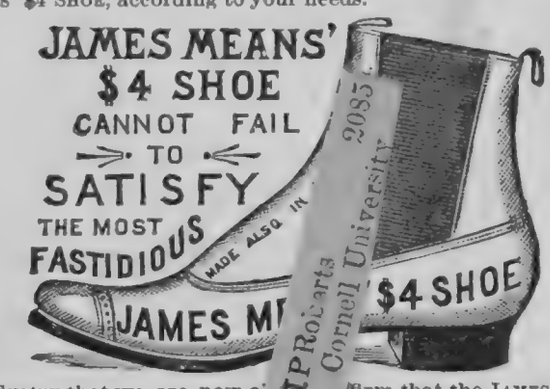
JAMES MEANS' BOOTS and SHOES are Unexcelled in Merit.

Positively none genuine unless having our name and price stamped plainly on the soles. Your retailer will supply you with boots and shoes so stamped if you insist upon his doing so; if you do not insist, some retailers will coax you into buying inferior shoes upon which they make a larger profit.

JAMES MEANS' $3.00 AND $4.00 SHOES

"Competition is the Life of Trade." and if you have not seen our latest improved goods you cannot imagine how lively trade is, or how hard our competitors have to work to keep within sight of us. Ask your retailer for the JAMES MEANS' $3 SHOE, or the JAMES MEANS' $4 SHOE, according to your needs.





Such has been the recent progress in our branch of industry that we are now a[ble to] affirm that the JAMES Means' $4 SHOE is in every respect equal to the shoes which only a few years ago w[ere] retailed at eight or ten dollars. If you will try on a pair you will be convinced that we do not exaggerate. Ours are the original $3 and $4 Shoes, and those who imitate our system of business are unable to compete with us in quality of factory products. In our lines we are the largest manufacturers in the United States.

Boots and Shoes from our celebrated factory are sold by wide-awake retailers in all parts of the country. We will place them easily within your reach in any State or Territory if you will invest one cent in a postal card and write to us Please mention the RURAL NEW YORKER.

A GRAND NEW ONION from GREECE. Unlike all others in form, *extremely handsome*, with thin, brown-yellow skin. *Very early*, of *unusually mild, pleasant flavor*, most remarkable from the fact that it is the first and *only one* of the large, mild Adriatic Onions that is *really a good keeper*. Solid and fine grained, *it remains as mild* and *sweet flavored in mid-winter as when freshly gathered*. A great acquisition, furnishing fresh, mild Onions *all the year round*.
Per packet 15 cents; or 2 packets for 25 cents.

BURPEE'S WHITE GEM WATERMELON A unique new variety from China; *really a gem*, both in *distinct beauty* and *delicious quality*. Ripens *early, wonderfully prolific*, and is *the sweetest of all watermelons*. The skin is a *cream-white color*, while the flesh is rich, bright pink, crisp and juicy. See beautiful *colored plate* in *Burpee's Farm Annual for 1889*.
Per packet, 15 cents; or 2 packets for 25 cents.

NEW MID-SUMMER LETTUCE. Of early, quick growth, this is *the best of all Lettuces* for use throughout the Summer. Firm heads, most attractively colored outside, with large, rich *golden yellow heart* within, *as tender and brittle as can be*. Peculiarly fine in flavor. Per packet, 15 cents; per oz., 40 cents.

THE 3 RARE NOVELTIES FOR 1889 briefly described above, are now first introduced, and can only be had direct from us. Seed of any will be mailed upon receipt of price. In order to introduce BURPEE'S SEEDS to thousands of new customers, we make the following LIBERAL OFFER. **For 50 Cents** we will mail one packet each of the above Novelties, AND ALSO one packet each of The New Volunteer Tomato,—very bright colored, smooth and early,—New Peerless Cabbage,—early, large and solid,—New Model Carrot,—the best in quality and appearance,—Globe Danvers Onion,—finest strain,—Burpee's Golden Upright Pepper,—largest, sweetest, and most handsome, New Density Okra,—New Perfection Musk Melon,—Peerless Cucumber,—Burpee's Improved Blood Beet,—New Earliest Carmine Radish,—Sugar Pumpkin and Burpee's Surehead Cabbage, —the famous *"all head and always sure to head Cabbage."*

The above FIFTEEN PACKETS of THE CHOICEST and NEW VEGETABLES at standard retail prices are worth $1.35, but we will send the entire collection, *neatly boxed*, by mail, *postpaid*, to any address, for only **50 Cents** in *postage stamps*, or FIVE BOXES for **$2.00.** We have the Largest Mail Seed Trade in America, built upon the high quality of BURPEE'S WARRANTED SEEDS, and this Remarkable Offer is made to induce thousands more to TEST OUR SEEDS. Entire Satisfaction Guaranteed to all purchasers, the great majority of whom we hope to retain as regular customers. ORDER NOW, and if you have not already received a copy, ask for **BURPEE'S FARM ANNUAL** for 1889, *enlarged and improved*, a most complete book of 168 pages, with beautiful colored plates, and hundreds of *illustrations from nature*. It tells all about the BEST SEEDS, Bulbs, Plants, and Thoroughbred Stock. It is full of useful information to every progressive farmer and gardener. Entirely free from exaggerated descriptions, it offers THE BEST SEEDS at fair prices. *Write to-day.*

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

PHOTO ENG. CO. N.Y.

VOL. XLVIII. NO. 2045 NEW YORK, APRIL 6, 1889. PRICE FIVE CENTS, $2.00 PER YEAR.

[Entered according to Act of Congress, in the Year 1889, by the Rural New-Yorker, in the Office of the Librarian of Congress, at Washington.]

Horseman.

SEBASTOPOL 5272 (7043).

A PICTURE of this fine Percheron stallion is shown at Fig. 79 The gigantic size of this animal is made apparent by the comparative size of the young lady who sits on his back. Sebastopol is a very fine specimen of his breed. Quite a heated discussion has been going on of late in some of the stock papers as to the relative merits of the French and English breeds of draft horses. It is to be hoped that some satisfactory basis for a test can be arranged so that the public may know which horses are best. Sebastopol is owned by Messrs. Savage & Farnum, of Detroit, Mich.

TICKS ON WESTERN PONIES.

PROFESSOR A. J. COOK.

IT is quite a common practice of late years for speculators to bring Texas or Kansas ponies—"mustangs" from the south-western part of our country, and sell them at auction in Michigan and other Northern States. If done in the autumn this is, I dare say, a safe and harmless proceeding; as I have known several such sales late in the season and no evil results followed. But if these sales take place in spring or early summer, the ponies having just come from the mild, open winters of Missouri, Kansas and Texas, the matter assumes an entirely different aspect. In this case the purchaser secures far more than he bargains or pays for Indeed an evil is introduced that becomes very annoying and may be very expensive. I refer to the ticks—Ixodes—which, though they seem not to affect so seriously the ponies, are most terrible pests when they spread to our Northern horses and cattle. I know of several cases where horses have been so injured that they were fairly skinned alive; as one man said the horses were "externally one solid sore." In a few cases they have actually died. Not only have the ticks attacked horses turned in the same pasture at the same time, but the eggs are so scattered that horses or cattle turned in later—after the ponies were removed—became infested, and some valuable pedigreed colts were nearly killed before the evil was discovered. In one case ponies were pastured in a field where there was a straw stack, and weeks afterwards, horses were turned in and became the camping and foraging ground of these pests.

So terrible is this evil, when it comes, that I think, if necessary, it would be wise and very desirable to legislate against the importation of such ponies early in the season. I think our winters are too severe for the ticks. If this is so, then the fall importations are not objectionable. The Hon. J J Woodman, ex-Master of our State, and also the National Grange, in conversation with me, said he believed that a quarantine against these ponies was more than justifiable.

What are these ticks? The word tick refers in our common parlance, to two very different kinds of animals. Thus we have our sheep-ticks and allied animals. These are true insects belonging to the house-fly order, and are very different from the ticks under consideration. The true ticks are really gigantic mites. They belong to the spider sub-class—Arachnida—and to the order of mites—Acarina. Thus they have eight legs, simple eyes, antennæ Like the mites, they have a short, broad head—rather simple mouth parts, a prominent thoracic shield—see Figures 81 and 82—and the abdomen is neither segmented, as is that of the scorpions and harvest-men, nor plainly separated from the thorax, as it is in the true spiders. Again, the mites and ticks have only six legs at first; but eight when mature. All the others of the spider sub-class have eight from first to last.

PERCHERON STALLION SEBASTOPOL. Fig. 79.

THE TICKS—IXODES.

The ticks are external parasites on warm-blooded animals. They are well fitted to suck blood on which they subsist. The wood tick of my boyhood days was a very unwelcome and by no means uncommon visitor. As I would go to the woods for pleasure, or the cows, one of these blood-suckers would pre-empt a little spot on my neck or back, and before I could get help would sink its barbed rostrum deep into my skin and tissues, so that any attempt to pull it out would surely tear off its head, which would be thus left to irritate and disturb for hours afterward. The Texas pony ticks, (Fig. 81, exact size) which vary in color from a light greenish yellow to red or brown are, I suppose, the Ixodes bovis. At least they answer the description well, and work here on both cattle and horses. They vary as much in size as in color. Thus we have in our collection specimens ranging from nine to 15 m. m. (from .36 to .60 of an inch) in length. Yet all laid eggs, so they were doubtless mature. Very likely this variation can be explained by the length of time since they had a full meal, and the fact that they decrease in size as they lay their many eggs. Their skins seem to be extensile, to accommodate this varying size. Beneath (Fig. 81) we note the eight short legs, and two openings, one midway between the second pair of legs or a little in front of this, and the other posterior to a joint midway between the posterior legs. The first I take to be the oviduct; the last the anus. The position of the oviduct, so far

forward, explains a remark one of my students made to me: "Those ticks seem to lay eggs from their mouths."

The thoracic shield (Fig. 82) is broad, convex, cream-colored with brown lines, dots, and center, in front. This brown center in front is marked off by deep furrows. This shield is really shield-shaped. The head (Fig. 82) is short and broad with two pits one on each side. This terminates anteriorly in the rostrum, which consists of five parts (Figs. 82 and 83), the outside jointed palpi, the mandibles, which are toothed at the end, and the labium, which is extensively barbed beneath, (Fig. 83). From above we see only the palpi and mandibles. From below (Fig. 83) we see the barbed labium, the mandibles with their terminal hooks, and the labium with its rows of barbs. We now see how these ticks work. They anchor by driving the barbed labium into the skin of the animal attacked. The barbs hold them so securely that they break into two parts or lose their heads before they will let go their hold. They also hook on with their mandibles which are tubular, and so serve well to suck or to catch on. There the palpi which are semi-cylindrical by closing up, form a third suction tube. And thus we have a triple-acting pump, that draws fast on the blood and vitality of their unlucky victims. Horses in Van Buren and Lenawee counties of this State, were so gouged and bored by these ticks that they were literally raw, and blood not only oozed from their skin but actually fell in drops from their bodies.

REMEDIES.

An ointment made of lard and kerosene is quick death to these blood-thirsty ticks. The proportion should be one of kerosene to five of lard, so as not to be too harsh. Indeed the more dilute the better, so long as it kills the enemy. Mr. L. H. Bailey, South Haven, Mich, washed his cattle and horses with London-purple and water—one pound of the poison to 50 gallons of water—and was entirely successful in ridding his suffering animals of the ticks. Even though these pests suck, they have such large mouth organs that the solid poison is drawn in and they are poisoned. Cattle lice have been killed in the same way. Of course the ticks cannot be easily scraped off, as they are so well anchored. By far the best way is to practice prevention, by keeping the ponies away, except when they are brought to us in the late autumn. We must not only not purchase them, but we must not even give them pasture. The ticks are very prolific and give rise to several generations in a season. Thus if they once gain a foot-hold, they soon, unless promptly attended to, cover our animals with severe lesions and may do exceeding damage. These beautiful drawings were made by F. H. Hillman.

Biographical.

HON. NORMAN J. COLMAN.

AS THE first Secretary of Agriculture of the United States of America, we present a portrait of Norman J. Colman at Fig. 80. The subject of this sketch was born near Richfield Springs, N. Y., in 1827. As a boy on his father's farm he learned the various details of farm work and received a good academic education. In 1847 he went to Kentucky, where he studied law, taking the degree of Bachelor of Law at the Louisville Law University. He commenced the practice of his profession at New Albany, Ind., and soon became district attorney. In 1853 he resigned his office and removed to St Louis, bought the "Valley Farmer," which, under the changed name of "Colman's Rural World," he has since owned, and edited until he assumed the duties of Commissioner of Agriculture. He took a leading part in organizing the Missouri State Board of Agriculture, the Missouri State Horticultural Society, the Missisippi Valley Dairy Association and the National Sugar Growers' Association, and has been repeatedly elected president of these bodies. In 1865–66 he was a member of the State legislature. In 1874 he was elected Lieutenant-Governor of the State. When he entered upon the discharge of his duties as Commissioner of Agriculture four years ago, he established the Divisions of Ornithology, Mammalogy and Pomology, and a section of Vegetable Pathology. Under his immediate direction the process of manufacturing sugar from sorghum by diffusion was perfected and placed upon a paying basis, thus preparing the way for the saving of at least $100,000,000 now expended annually for imported sugar.

He has earnestly advocated such changes in the seed distribution as would enable him to carry on the work of testing and distributing seeds to the direct agency of the Experiment Stations recently established in the various States and Territories. He has manifes a warm interest in the success of the Experiment Station work, by establishing in the Department of Agriculture an "Office of Experiment Stations" which is intended to serve as a medium of communication and scientific progress.

Indust'l Societies.

THE TWENTY-SECOND SESSION OF THE AMERICAN POMOLOGICAL SOCIETY.

(R. N.-Y. SHORT-HAND REPORT.)

Improvement of native grapes; *Vitis rupestris*; *remedies against mildew and rot*; *Florida for grapes*; *Ives seedling*; *grafting the cultivated on the wild grapes*; *honesty in packing fruits*; *frauds in selling*; *suggestions for packing.*

Geo. W. Campbell, of Ohio, read an instructive and carefully prepared paper on the "Improvement of our Native Grapes." He said: "The improvement of our native grapes has engaged our attention for the last 30 years. We can remember when all the native kinds could be counted on the fingers of one hand. The pioneers in this good work were the Catawba and Isabella. Concord was first exhibited in 1853 The Delaware still maintains the highest position of the American varieties. By judicious hybridization or crossing I am sure we can equal the best varieties that are grown in foreign lands. But we cannot expect a variety that will suit all localities; that is impossible. Look at the Pocklington grape and the very conflicting reports about it. One extols it highly, another condemns it utterly, depending upon the locality. I have rooted out and destroyed hundreds of grapes that in other places would have been of great value. Some experiments in crossing with the Rupestris vine which is very hardy and resists mildew attacks, have been made. In crossing, my experience has shown that the staminate parent generally governed the quality of the fruit. Some of these hybrids recrossed upon the Southern Rupestris are very promising indeed. The Rupestris planted at the North has proven absolutely iron-clad against our severe winters, having stood 30 degrees below zero wholly unharmed, and it resists mildew in the most unfavorable situations. Recent crosses of some of the best natives and hybrid grapes, so far as they have fruited, have produced new types of a most interesting character. The vines have more vigor and the fruit is excellent in character and there is considerable variety. My experiments indicate that this is the rule with rare exceptions. It is my firm belief that through intelligent and continued crossing and hybridizing we must look for the most rapid, successful and important improvements in the character and value of our American grapes. For by these means the best of all varieties from every quarter of the globe can be brought together and their best elements united to form new types of every character and degree of excellence and adaptable to all situations where the vine can be successfully grown.

Another element of great importance for the future of grape culture is the recent discovery of successful remedies against mildew and rot. During the last two years it has been demonstrated that at a mere nominal expense vineyards may be protected, vines remain healthy, and the fruit abundant and perfect, where without the remedy wholesale loss would have occurred. The use of sulphate of copper, and lime remedies has proven effectual. They have been fully tested. These facts are significant even beyond the protection of the present vineyards. For by the use of these remedies at a cost of no consequence compared with their benefit, the finer varieties of our improved hybrids can be successfully and profitably grown in thousands of localities where they could not be without them. Grape culture in this fair Florida and in the South generally, I believe to be in its infancy as yet. With its charming climate and wonderful variety of soil and situation I see no reason why, with proper selection of varieties and the aids at command from horticultural societies and scientists, the sunny South should not be both the garden and the vineyard of the North American Continent." This concluding sentiment of the veteran grape man was of course highly enjoyed by the Southern delegates, and everybody applauded the paper.

Mr. Brackett, of Iowa, then started a lively discussion by alluding to the Ives Seedling and its success in the West. He said it was excellent in and about Burlington, and was the most valuable grape grown there. "The trouble with the Ives is, people do not leave it long enough upon the vines to ripen. It should be left three or four weeks after it is fully colored." South and North joined in defense of what was termed a much abused grape. Among the energetic speakers was Mr. E. Williams, of New Jersey. Said he, "The Ives is not an early grape, though it is sent to the New York and Boston markets early, and long before ripe. Of course, it is not good then, almost unfit to eat in fact. But when fully ripe it compares very favorably with other good grapes, being better than Corcord."

An important point developed during this discussion was that the cultivated grapes could be grafted successfully upon the Muscadine type of wild grape. President Berckmans said this had long been considered impossible by all pomologists, and he inquired very carefully as to the precise facts. Several Florida members testified to having accomplished it frequently, getting large growths and even some fruit.

Mr. E. Williams then followed with a practical paper on, "Honesty in Packing Fruits." "A man who desires to build up his reputation and a demand for his products will be careful to grade his fruit and see that every package shall be just what it purports to be. His merchant can then count on his fruit every time. Those most ready to charge fraud need not go beyond their own doors for the cause and the remedy. Purchasers know a good thing when they see it and can detect an attempt to deceive quite as readily as see the merits of an article. Placing grapes on the market in an unripe condition is another method of fraud. The fruit itself favors it. With other fruits the eye is the expert detective; not so with the grape. Sampling is the only true test, and this is difficult to carry out, as it would soon render the packages unsalable. The eagerness to be first in market and get the almighty dollar brings this fruit on sale weeks in advance of its maturity. Confidence is thus destoyed and prices depressed beyond recovery. I have heard people inquire for some 'real sweet grapes once more.' This fraud has been practiced so long now that people begin to doubt whether the grape grows here now equal in sweetness to those of former days. Near me are two growers. One gets his grapes in market as soon as they are colored, whether ripe or not. He says he is after the money and the people may have his grapes green for all he cares. The other refuses to gather until ripe, packs and sorts carefully, puts in nothing but perfect clusters of number one fruit, warrants each package to be uniform all through, puts his name and brand on each. His number two fruit goes unbranded and sells on its merits alone. The latter sells for more than the branded fruit of the first grower. His merchant says he can sell his fruit under any condition of the market. Early in the winter the New York market was flooded with Florida oranges and the merchants told me they didn't know what to do with them. These things carry their own moral. Remember, first, the cost of the box, labor, packing and transportation is the same in one case as in the other: second, that every box of number two fruit reduces the general average of the whole, that appearance, quality and uniform size are all important passports to profit, and that in this business "honesty is the best policy."

NORMAN J. COLMAN,

First Secretary of Agriculture. Fig. 80.

Everywhere.

RURAL SPECIAL REPORTS.

Iowa.

WIRT, Ringgold County, March 21.—Farmers have commenced sowing oats; there has not been any rain here this spring. There was very little snow during the winter. All kinds of stock are very low and as the farmers in this county depend upon stock-raising to make a living, money is very short with them. Corn, 20 cents per bushel; oats, 18 cents; hay, no sale; cows, $18 to $25 per head; horses very low and of slow sale. If people were out of debt they could do very well with low prices, but when there are payments to meet it goes pretty hard with them. J. D.

Missouri.

CLARENCE, Shelby County, March 16.—Crops last season were very satisfactory to the farmers as far as quantity is concerned. Corn yielded bountifully and is worth at present 25 cents per bushel; but with No. 2, worth only 29 cents in St. Louis, farmers would hardly realize more than 20 cents were it not for the large number of cattle being fed in this vicinity. Oats were a good crop, but were damaged to a large extent by lodging before harvest. They are worth now at the railroad station 18 cents per bushel. Wheat averaged from 15 to 30 bushels per acre and is worth now 80 cents per bushel. Potatoes and apples are drugs in the market—worth nominally about 20 cents each per bushel. When we consider the cost of labor in producing the above-mentioned products and the prices obtained for them we must conclude that the Parrot is right and that "Farmin Don't Pay."

But "there's room at the top" Fat cattle are worth about $3.00 per 100 pounds. Do Eastern consumers get their steaks at a correspondingly low price? We appreciate the RURAL. M T.

Ohio.

FLUSHING, Belmont County, March 4.—The past month has been somewhat wintry. The mercury has reached zero two or three times. Fall and early winter were quite wet. No scarcity of water; little snow. Bad roads almost all winter. Wheat that got a good start in the fall is looking well. Corn matured slowly and late: since, spoiling in crib. Wheat is selling at $1.00; corn, 50 cents; apples, 25 cents; hay, $15; potatoes, 40 cents. W. L. A.

Oregon.

OAKVILLE, Linn County, March 13.—I am just in receipt of the RURAL for March 9th; how does the paper get across the continent so fast? This number is a regular farmers' institute; so I think is every issue of the R. N.-Y. There is little need for any other farmers' institute to a reading, thoughtful farmer. My wife says she must have her name entered for the potato contest, and my wee lassie, Clara, says she will help her ma to grow the potatoes. We had an immense crop of potatoes last year, and there is no market this spring. Some of the cows, however, are very fond of them. Is it not a pity that they are such a perishable crop? We have had a very mild winter with frost enough on one occasion to kill the tomatoes. Plowing and sowing have gone on nearly all winter. We used to be happily free from insect pests in this country, but we had a full crop of coddling moths last summer. Our horses and cattle were driven nearly frantic by a fly which, they say, was brought here by the Northern Pacific railroad. It resembles a house fly, but is a regular blood-sucker. We want the entomologists to introduce some other insect that will prey upon these and so rid us of them. R. L. S.

Pennsylvania.

SCOTTSVILLE, Wyoming County, March 16.—We had a very open, wet winter with but little snow, not having any very hard freezing weather. Wheat is looking well so far. Produce of all kinds is very low—corn, 43 cents per bushel; oats, 38 cents; rye, 45 cents; wheat, $1; hay, $15. per ton; butter, 20 cents; eggs, 14 cents. Times are very hard and dull for farmers and laboring men. We are so

Fig. 81.

close to the Wyoming and Lackawanna coal regions that dull times there make quite a stringent market here. Miners are at work only on half time. I hope that each RURAL subscriber will try to get at least one yearly subscriber to the RURAL. That will double its subscription list. I certainly think that if the farmers have a true friend it is the RURAL NEW-YORKER, and we ought by all means to help our best friends. J. G. F.

Farm Economy.

RACKS FOR TOOLS.

THE Farm Implement News recently printed several designs for racks suitable for holding various kinds of tools in every-day use. We show them at Figs. 84, 85 and 86 The drawings are such that no explanation is required.

THE FARMERS' CLUB

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention. Before asking a question, please see if it is not answered in our advertising columns. Ask only a few questions at one time. Put questions on a separate piece of paper.]

INDIGESTION AND IMPACTION IN COWS.

E. M., Circleville, Texas.—What is to me a new disease has killed most of my cattle. They were raised on prairie with sage grass. In August, 1887, the weather was so dry that the grass was all gone, they were moved to a mountainous country 150 miles away in five days. All were doing well until the blizzard in January, 1888. Then many of them had their noses and udders frozen. In the spring, just as grass began to appear, they began to die. Some would slobber and look wild out of the eyes and would run over everything, seeming crazy for water, and if they came to a high bluff they fell off, either drowning or breaking their necks. If they could get to the water they would sometimes drink until their

Fig. 82.

hides would burst; at other times they would drop dead first. Some would run until they fell; almost all were mother cows or young heifers. Others would swell up under the jaws and if the tumors were lanced, they would discharge a black, very offensive pus. The animals seemed to have no use of their fore-parts. All died that were so affected. Others were taken with diarrhœa and their droppings were as black as ink and so offensive as to cause sickness; those affected in this way had no use of their hips. A few were cured by giving lard. Some had the disease twice and a few the third time. Most of them ate until the last; and none ever refused water. They were never able to get up after they had been taken; they had to be lifted. Then they could stand very well. They groaned and seemed to be in great pain while down. Some lived a few hours while others lived for two, three and four weeks. Almost always those that were in the best order were taken. After death, on each carcass, there was a black strip eight inches wide around the body just back of the shoulders and under the neck and breast, and they had the appearance of having been beaten with a hammer, and the gall was as large as a half-bushel. The carcasses of all were so offensive that they could hardly be skinned, and by starting the skin around the neck and fastening a rope to it the entire hide would peel off, owing to the presence of a jelly-like substance between the hide and body. The bones were so rotten that they would break to pieces in turning the cows over. What is the cause and is there any remedy?

ANSWERED BY DR. F. L. KILBORNE.

The disease appears to have been indigestion with more or less impaction of the first and third stomachs, followed in some cases by complications as indicated by the varied symptoms. This disease is commonly called "dry murrain," "impaction of the third stomach," etc., and when it occurs on pasture, "grass staggers." In this case we cannot say just when the trouble began. It may have been due, in part, to the starvation and exposure during the winter, or wholly to the feeding in the spring. At this time the cattle were evidently in poor condition with a ravenous appetite, and in picking the young grass considerable quantities of the old, dead grasses of last season were also eaten. It was eating this coarse, dry, indigestible food that probably caused the indigestion and impaction. Such feeding is not infrequently the cause of fatal outbreaks of disease on the range in fall, winter and early spring, and also in late summer droughts. So suddenly do these outbreaks occur, and so rapidly do the animals die, that they are occasionally mistaken for outbreaks of some contagious disease. The disease is not contagious,

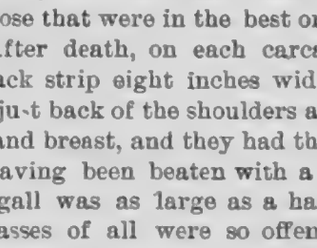

Fig. 83.

however, but due to the common cause—dry, indigestible food. The proper treatment at the outset would have been to have given each cow one to two powders of a mixture of equal parts of Epsom salts and common salt, with one ounce of ginger to each cow. The dose should be given dissolved in two or three quarts of warm water. If this did not move the bowels in 15 or 18 hours the dose should be repeated. In severe cases also give one ounce each of sulphate of soda and ginger, and one-half ounce of carbonate of ammonia in a pint of cold water every four hours until relieved. Owing to the difficulty in giving medicine to a large herd of range cattle, it is better to take some general precautionary measures to prevent the disease. During the fall and spring, or at any other time when the cattle are compelled to eat large quantities of these dried or dead grasses, special precautions should be taken to ward off the ill effects of such feeding. When possible, it is, of course, desirable to supply suitable food. But when this cannot be done, see that the cattle have free, daily access to common salt, have an abundance of good drinking water conveniently at hand, so that they can drink frequently instead of taking in larger quantities at longer intervals. A daily ration of coarse bran or shipstuff containing an ounce of sulphate of soda to each animal, could be given with advantage.

RECLAIMING A WET FARM.

P. H., Fort Wayne, Ind.—In 1888 there was a large body of land lying west of this city comprising about 40,000 acres, drained by a large system of ditches to such an extent that it is believed that the ditches carry off all the water that falls upon the land, and all that may run on there even at times of ordinary floods. They can lower the water level at least eight feet below the surface of the ground. This tract of land will average about a mile and a half wide, and a small stream emptied its waters into the upper end, but the land being so flat it soon had no channel nor did any of the other creeks, of which there were several, have any channel in this low

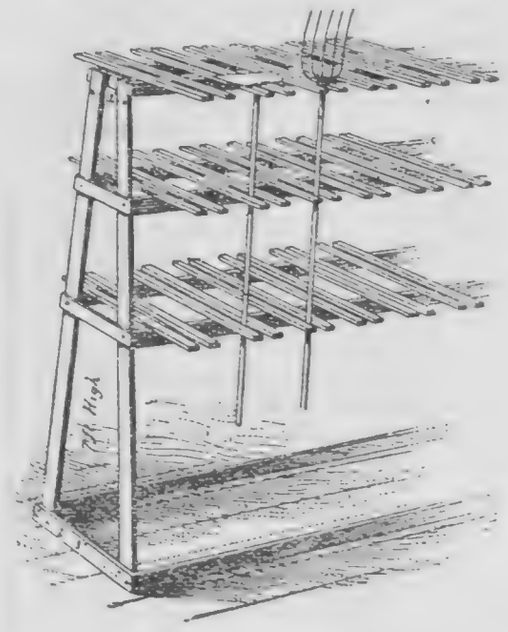

Fig. 84.

land. The streams that poured their waters over this land were very rapid and deposited over the prairie a great portion of the silt or soil that they gathered from the high land. About one-third of this land was covered with soft timbers such as elm, black ash, etc. The other was open and produced all kinds of grasses from Red-top and Blue-joint, to bull-rushes. A part of it—perhaps one-third of the whole extent—is noted by the first surveyors in 1820 to 25 as being prairie. I bought some 400 acres of this land on the north, within about twenty rods of a station on the Wabash railroad. On the north side, and perhaps a third of the west, there is a surface formation that most people would denominate muck, that will run from six inches to six feet deep. It is all underlaid with silt or rather marl formation, and under that clay hard-pan. This muck is very black and has lost its vegetable or pasty look, so that when one spades up a shovelful, it falls off of the shovel or crumbles down from the pile like soil. Through the center of my farm there runs an island, as it is called, that is raised perhaps from eighteen inches to ten feet above the prairie. The soil on this is rather of a sandy nature, although the timber that has grown upon it, was all kinds of burr oak, beach, hickory, etc. To the south of this island my farm is entirely covered with timber, mostly black ash, elm, maple, with considerable white ash, some sycamore, cottonwood, burr oak and white oak. I want to make a very fine farm out of it, and am proposing to thoroughly tile it and if possible to increase its fertility to a very high state. I can get lime (quick-lime) from the kilns a few miles from me delivered at my station for about a dollar to a dollar and a quarter per ton. I am about seven miles from this city, with a good road as well as the railroad. I have been thinking some of having several varieties or the soil analyzed, but have had some doubt as to the practicability of doing so. I wish you would give me your ideas as to what would be the best general course to pursue.

ANS.—Such land as this ought to be rich enough to make "a fine farm" without any help but draining and good tillage, and the regular manuring which follows a judicious system of farming That better timber has not grown on it is due to the wetness of the land and not to the infertility of the soil.

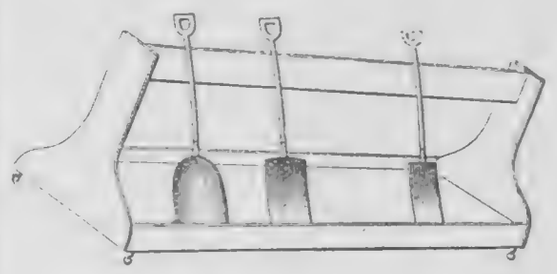

Fig. 85.

Possibly the land having been wet so long contains various acids which would be neutralized by the lime and thus be much improved. Lime is not manure and in this case would be simply useful for the chemical effect mentioned and its mechanical influence in making the land more firm and solid. Hence two tons per acre (50 bushels) spread after draining and plowing might be beneficial. Analysis of the soil would hardly be any help.

ABOUT CREAMERIES

T. J. H., East New Market, Md.—1. What should be the size of a creamery building for a patronage of 200 cows? 2. What kind of machinery should be used and how much will it cost? 3. On what basis can a creamery be run satisfactorily?

ANS.—On the supposition that the creamery is for the purpose of handling gathered milk, to make butter, it will be found that a one-story building will be most convenient, and one 25 by 50 feet with 12 feet studding, will be found to be of handy working shape and be ample in space to put in all the needed tools and machinery, except that it may be well to have a small boiler-room in an L adjoining the side, placed so as to be most convenient for connection with engine and machinery, inside of the main building. Enough from the north end of building may be taken for an ice-house and cold-storage room, to hold accumulations of butter for, say, two or three weeks. This would leave a room 25 by 38 feet for storing vats for milk, separator, cream-tank, churn, butter-worker, engine, pumps, and skim-milk receptacle. Where lumber can be had at an average of $16 per thousand, and foundation stones for but little more than the cost of putting them on the ground, such a building can be made for about $500, building it much as silos are now built, so as to make it both warm and cool; though two by four studding would do, whereas a silo would need two by 12. This is independent of the water supply, as that varies so that an estimate would be useless. 2. There should be a ten-horse boiler, at least a six-horse engine, a separator, storing vats, churn, pumps for water and milk, if needed, butter-worker, scales, the necessary piping for conveying water and steam, stove, and weigh-can and small utensils that need not be specified. The cost of all these with a separator that will

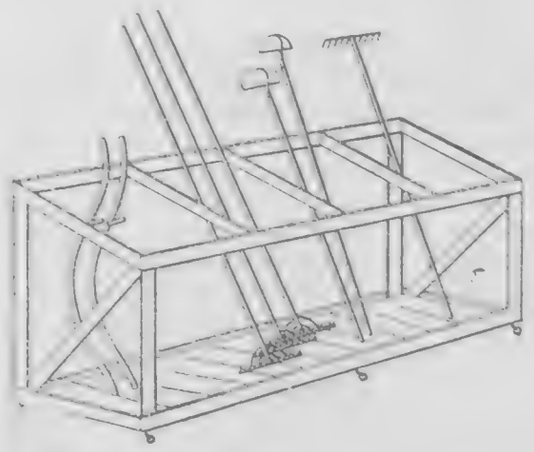

Fig. 86.

cream 1,500 pounds per hour, would be from $1,000 to $1,200, ready to get up steam. The kind of separator, as well as the kind of steam-power, must be determined by the buyer, and need not be stated here, as there are now two main rival kinds, both good. There are reasons why each is preferable for some purposes. The buyer must know his conditions for using either, and not ask us to decide for him. 3. Let the creamery be run as most other

factories are run—by an expert who owns the whole plant, as he would the grist-mill, blacksmith-shop, machine-shop, or store of the locality. Or the building, and sometimes the machinery, may be owned by a capitalist interested, or a joint stock company of farmers, according to circumstances, and the capital of the right man would then be used for manufacturing the butter. He should not buy the milk, or be constrained to do so, in order to get patronage. He should make the product by the pound, and give the farmer all, save the fee for manufacturing. He should be held responsible for making a good product, in the best style and method of manufacture, and for putting it into a safe and attractive package. There should be a cooperative spirit on the part of the patrons, a helping of each other in the way of getting good stock, and learning the best methods of growing foods, caring for cows and their milk, and a generous spirit of forbearance and helpfulness toward the manufacturer, and a cheerful compliance with his instructions, especially in regard to caring for milk. If held responsible for a good product he must have the right to reject defective milk, if it comes.

ABOUT MANURE.

G. W. G., Justus, Pa.—1. What is the percentage of loss in plant food from a pile of manure exposed to the weather from November until April? 2. What is the best practical method of keeping manure, where from 10 to 25 head of stock are kept? 3. What is the value of liquid manure from horses and cows, and the best practical method of saving it?

ANSWERED BY PROF. I. P. ROBERTS.

1. So much depends upon the character of the manure, the depth of the pile and the amount of rainfall that no definite answer can be given. From observation and experiment I should say that manure spread out from four to eight inches in depth as in most barn-yards, would probably lose at least one-half of its real value. Some experiments in England show that five tons of raw manure, lost in rotting, one-half of its nitrogen and over one-half of its bulk. When we consider the amount of water that falls, upon the average, on each and every acre in this State, one cannot understand why any thinking man should deliberately store the most valuable produce of the farm in an open barn-yard for from six to nine months in the year. Three thousand two hundred tons of water fall on each acre annually and on each barn-yard of 100 by 110 feet, 800 tons. Can a farmer afford to put a man at one dollar per day at one end of a dung fork to lift 800 tons of water at the other end; or can he afford to baptise his manures? He is compelled to haul this water to the field if it does not leach out; if it does it carries valuable plant food with it. Some experiments conducted at Cornell University show that 60 cents worth of plant food was lost with each ton of water that leached through eight inches of strawy manure. Eight hundred tons to lift or leach! Farmers, can you afford it?

2. What cannot be hauled out in late fall and early winter, and spread where there is a plant growing, and what is made, say, from December or January to May should be kept in a covered yard or a manure cellar or in a water-tight rotting pit in the open, where all leaching may be pumped back on the pile. We use both the first and the last of these methods and find them very satisfactory. 3. Under average conditions we shall find the following:

	NITROGEN	POTASH	
Horse 3000 lbs.	46.5 lbs.	45 lbs.	Value $9.93
Cow 8000 "	46.4 "	39.2 "	" $9.65

The above is computed on the basis of 17 cents for nitrogen and 4½ cents for potash. In open barn-yards and in piles of hot horse manure most of the nitrogen and not a small share of the potash are lost. Mix the dry horse manure with the wet cow manure. Use as absorbents dry earth or muck, buckwheat hulls, sawdust, gypsum, imported moss, shavings, straw and refuse hay. It none of these can be found in sufficient quantities, then the urine should be run into a water-tight receptacle, pumped into a tank and spread upon grass land, but this as a last resort. What sane man would leave his barn roof off to save a little expense and let 360 pounds of water fall annually on each square foot of hay mow? What informed farmer will continue to let 360 pounds of water fall on each square foot of the barn-yard when it usually contains three to five times as many tons as his hay mow, each ton of which if it is properly made manure, is worth $3.00?

PERMANENT GRASSES FOR HAY.

A. H. H., Rayville, Maryland.—I have about two acres of land in my orchard that were in potatoes and beans last year. The land is in tolerably fair order but not rich. It is a hill-side and adjoins my yard at the dwelling, and as it washes badly when in cultivated crops I want to seed it permanently with those kinds of grasses that would be best for hay, as I never expect to pasture it. What kinds of grass seeds had I better use? Would several kinds be better and produce more hay than one or two? I have read that an acre of rich soil well seeded with a good selection and variety of perennial grasses will produce six tons of well-cured hay in one season without difficulty by cutting early and mowing twice. Does the RURAL think this statement reliable and within bounds? The writer of the book recommends five quarts of Timothy, three of White clover, six of Orchard grass and three of Red-top per acre. I have also seen a recommendation of a mixture of seeds for hay and pasture by Mr. Joseph Harris. It consists of the following: Orchard grass, English and Italian Rye grass, Meadow Fescue, Meadow Foxtail, Fall Meadow Oat grass, True Perennial Sweet-scented vernal grass, Kentucky Blue-grass and Red-top. He recommends three bushels of this mixture and one quart of White clover, one quart of Alsike and four quarts of Medium Red clover per acre for uplands, sown alone without grain. The trees on this part of the orchard do not stand very close together, but of course there is some shade. Is the above mixture as good a selection as I could get for these two acres, and would the shade be against the full development of this mixture of grasses?

ANS.—The mixture of grasses mentioned as recommended by Joseph Harris is a good one, although the quantities of each should be stated. Three bushels of these grasses would be about 40 pounds in weight and as little as should be sown. The quantity might be divided as follows: Six pounds Orchard grass, 15 pounds of Pacey's Perennial Rye grass, five pounds of Italian Rye grass, and five pounds each of Tall Fescue, Fox-tail, and Tall Oat grass; in all, 41 pounds. Kentucky Blue grass will not do well in Maryland, and Red-top is a very poor hay grass. The statement referred to is too rose-colored; in fact, it may be said to be impossible with the grasses mentioned, as White clover and Red-top are very poor plants for hay, and Timothy and Orchard grass mature at such a long time apart that either a light crop must be cut or the hay will be inferior. Necessarily the trees and the grass will be injurious to each other, and unless the ground for 25 feet around each tree is kept free from the grass and is cultivated and manured, there will be but a poor growth and poor fruit. Orchard and meadow are decidedly antagonistic. The grass seed may be sown as soon as possible, either alone or with oats sown thinly and cut for hay when in first head. The land should be well plowed and harrowed and fertilizing will be desirable if it is not manured.

HOW TO LOAD A WAGON: FEED FOR A COLT.

P. K. S., Prattsburg, N. Y.—1. Farmers and teamsters generally load their wagons heaviest over the forward (smaller) wheels in order to get the load nearer the team, as they can handle it easier; are they right? 2 I am feeding a three-year-old colt oats in the bundle, and the orts of clover hay after the calves have eaten what they will; what should I add to the rations?

ANS.—1. The question of draft is one that involves several points of scientific calculation and depends upon several varying conditions. On a level road when the wheels are of such a hight as to bring the line of draft on a level with the center of gravity of the load and the load lies equally upon the four wheels, the draft will be the easiest, and the team will move it most readily when closest to the load. When the line of draft is higher than the center of gravity of the load, the draft will be heavier as pressure is exerted on the load, and *vice versa*. As a wheel is a sort of lever, the larger it is, the easier the load is moved, within certain bounds; and all the more on any roads but those with perfectly solid and unyielding tread, as on a railroad. Earth roads which yield under the wheels cause the load to move up a constant incline, in effect; and a rough stony road is worse still. And then the larger the wheel the more easily the load is drawn; the broader the tire also the easier the draft. In loading a common wagon under ordinary circumstances the load should be evenly apportioned on all the wheels; when the road is rough, the larger and hinder wheels may be loaded somewhat heavier than the forward ones for the easiest draft, on the principle above mentioned. 2. Bran for all growing animals should make a considerable part of the food. This is evident considering that young animals are making bone and flesh, and thus require nitrogen and phosphoric acid in the most digestible form, and these are provided by bran as may be thus shown.

COMPOSITION OF BRAN.

FEED FOR COWS FOR BUTTER.

W. G. F., Ithaca, N. Y.—I am feeding to milch cows for butter equal parts by weight of ground oats and corn; is this an economical ration and how many pounds should be fed an ordinary 1,000 pound cow? How could the ration be improved? Each cow has 10 pounds of potatoes and all the good clover hay she will eat Will it pay to grain cows in June and July if they have good pasture?

ANSWERED BY HENRY STEWART.

In choosing foods for butter-making the effect upon the character of the butter is to be considered more than the fat contained in it. It has been found by experiment and long practice in medical and physiological investigations, that the fats of the food are emulsified with the pancreatic fluid and are absorbed by the intestines directly into the blood without alteration; and the use of fatty matters as medicine is controlled by this well known fact. As the fat of the milk is derived from the blood the food must necessarily exert an influence upon the character of the butter, and this is clearly proved by practice in the dairy. Linseed-oil-cake meal, which is rich in fat, of which the flavor is bad, makes poor butter, while that of cotton-seed meal, which has a bland, sweet and nutty-flavored oil, equal to the very finest quality of olive oil, and has also a rich yellow color, makes the finest butter. The fat of oats is white and hard and makes inferior butter; that of corn-meal is much better. Hence oats cannot be considered as a good food for butter-making cows. The action on the digestive organs is also to be considered and it is found that bran has a good effect in this way. Hence the most desirable food for butter cows is made up of corn-meal and bran in equal parts and as much cotton-seed meal as can be given healthfully, which is about one-eighth part of the whole grain food, or one pound of the cotton meal to four pounds each of corn-meal and bran. This may be considered as a standard ration for a 1,000-pound cow, to be increased as the cow can profitably dispose of it; some cows will consume this quantity at one feed, and increase in yield on it; others cannot digest it. This is to be found by testing the cows with caution, stopping at the point of safety.

CORN FOR A SUCCESSION.

J R, Lexington, Mo.—I have agreed to furnish 60 dozen ears of sweet corn per day, during the corn season. This will require 600 dozen ears every ten days. I want to plant the Cory for first, Minnesota for second, Moore's Concord for third, Cory for fourth, and Stowell's Evergreen for the rest of the season; how many acres of each shall I plant at one time and what space of time should elapse between the plantings? The party wanting this corn told me to plant Cory, Minnesota, Moore's Concord, and Stowell's Evergreen all at the same time, and then Cory 10 days later for a succession of 50 days running. I am doubtful about what he says.

ANS.—Why any one wants to plant Cory for a late or later succession we cannot understand The ears are small and the quality inferior. It is the best we can do for *first* early. After that its usefulness is gone. The R. N.-Y. advises the following succession as being as good as any. Cory, Minnesota, Perry's Hybrid, Crosby, Moore's Concord, Triumph and Evergreen. All the above may be planted at the same time, though, of course, each will lap over upon the next. To insure the best corn in its season we should plant relatively less of the earlier kinds so that they will have been exhausted when the later and better kinds come in. For succession we should plant only the intermediate or later varieties. For instance, Triumph or Evergreen might well be planted every 10 days after the first planting. Or Crosby might be planted as late as July if there is no objection to rather small ears. The last question we are unable to answer, so much depends on the fertility of the land, etc. The R. N.-Y. invites discussion on the above questions and answers.

TREATMENT OF AN UNPRODUCTIVE ORCHARD.

S. C., Riverside, Mich.—I have a Rhode Island Greening orchard of 150 trees about thirty years old, which have not borne any fruit to speak of for a number of years. The orchard has been plowed every year but the trees have not been properly trimmed. They are covered with what I call tree lice. What can I do to make them bear?

ANS.—The best thing to do to such an orchard is, first, to manure it liberally and work the manure well into the soil with a disk or Cutaway harrow. Then put on sufficient fertilizer for a crop of beans and plant them, keeping the ground well cultivated until the crop is matured. This is under the supposition that the trees are not crowded,—that is, they should have been set out originally not less than 35 feet apart each way. If they are closer, thin them down, (by cutting and digging out the poorest) to not more than 36 trees to the acre. Then the next spring get an experienced hand to prune the remainder, removing only such limbs as evidently must go, and covering the cuts with a coating of warm coal tar. When the trees have started a healthy growth, the lice, (if the leaf louse or aphis is meant), will not be likely to do serious harm. But if the trees are infested with bark lice (the scale insect), they can be combatted at the time when the young insects emerge from the scale, generally in May, (making the bark look as if thinly sprinkled with flour), by spraying the bark all over with weak lye, about one-fourth as strong as is needed for making soap; or ashes may be thrown into the tree when the bark is wet. As a rule, the bark lice do not seriously injure vigorous trees.

TO GET A COW WITH CALF.

L. E. H., Easton, N. Y.—A young cow dropped her calf in March last, and appeared to be all right. In about two weeks afterwards she was taken with what was termed by our veterinarian, inflammation of the womb, and was treated for the same by him until she was to all appearances cured. Since that time she has been in season at regular intervals. She is now giving milk, and seems well in all respects. She has been taken to different bulls, but to no purpose. Can anything be done for her?

ANS.—Give the cow two table spoonfuls of the following powders in the feed night and morning: Sulphate of iron and powdered nux vomica each four ounces; powdered gentian root and ginger each eight ounces; ground pepper two ounces; mix. If the cow is fat reduce the feed, especially the grain ration. Give little or no corn. Allow at least four or five hours' exercise daily out of doors when the weather will permit. The stable should be light, cool and airy. Have the neck of the womb examined by your veterinary surgeon, to make sure that the passage is open, and that there is no catarrh or discharge. When next in heat and just before being served by the bull, have the passage through the neck of the womb very carefully dilated with the oiled hand, by slowly introducing one finger until you can insert two or three fingers. Then let the cow be served immediately by a common or grade bull—not by a thoroughbred. Repeat this treatment at the next period if not successful the first time.

CANNING MEAT AT HOME.

Several Subscribers.—Is it practicable to can beef or other meats at home?

ANS.—Canned meats are pretty cheap now, as they are turned out in immense quantities by the wholesale canners. Many think the large canners are not so neat and particular in the selection of meats for canning as they should be. Farmers who kill beeves are sometimes left with a quantity of meat on their hands that they cannot sell at a profit. Prices for poultry are sometimes so low that useless stock must either be kept at a loss or almost given away. In such cases it may pay to can this meat and thus hold it in an excellent form for future consumption. As to the profit of the operation each must determine for himself. One of our Connecticut subscribers, Mr. H. Harrington, writes as follows about his method of canning:

"I first strip the meat from the bones, and cut it into pieces as large as I can get into the cans. At the canning factories I get cans made of tin called three-pound cans, but they will hold just two pounds of beef or any other kind of meat. One should not put in more than this, for if he does, he will have trouble. Put in one table-spoonful of salt and solder tight, leaving no vents. Place the cans in boiling water and boil them for 45 to 60 minutes; take out and pierce each can with an awl, then solder each hole made with the awl. As soon as you can, put them back in the water, and boil them until the meat is tender. Beef, chicken or any other kind of meat put up in this way, will keep a life-time if desired. I have practiced it for a good many years."

CUTTING SILAGE FOR FEED.

S. A. L., Mooresville, N. C.—Is it best to feed silage from the top or to cut it down from the side? 2. Where can tarred paper be obtained and at what price?

ANSWERED BY PROFESSOR A. J. COOK.

It is better to feed from the top. In the

first place, it saves all trouble of cutting it down; and it is very easy to fork or rake it off from the top. Again, if we take twice a day from the top, the exposed surface is constantly kept fresh, and so there is no spoiling of the silage. This saves the silage and keeps the barn sweet. Where the silage is cut down, the side molds and ferments and fills the building with the sour, disagreeable odor of fermentation. My barn is sweet, so that even on warm days, one may enter the close basement without being reminded of silage or the silo. I know of another silo where the silage is as sweet as that in my silo; but where the barn is so sour with fermentation that I dislike to go into it. I do not like to keep my stock where I find it disagreeable to stay. This barn has a large silo,and the silage is cut down from the side. I believe this explains the sour odor, so I say emphatically, feed from the top, and make the opening on the side reach to within two feet of the top. 2. Tarred paper in the North is used extensively for sheeting frame houses inside the clapboards. Now we get a thin, tough paper that is preferred by many to the tarred. The tarred costs about two cents per yard, the other a little more. The hardware merchants keep this paper on hand in all our villages and cities.

AN AILING FLOCK OF HENS.

A C L., Windfall, Ind.—What is the matter with my Brahma chickens? One has lost the use of his legs which stick out straight behind him; another has a big boil just back of where the wing joins the body and it discharges what to all appearance is clear blood. Two others appear crazy; they will start and run a few steps then turn round and run straight back again, jerking their heads from one side to the other as though looking for something they imagined was after them. The wing of one which died became a mattered sore, and its comb was a dark purplish red, but the combs of the rest are bright and healthy. They have been fed mostly whole corn with potato and apple parings. They have an almost unlimited range and have had Douglas mixture.

ANS.—The difficulty is due to the use of the Douglas mixture, so far as the boils are concerned, while the vertigo is due to pressure of blood on the brain, caused by over-feeding, and an over-fat condition. The fact that the Douglas mixture shows the effect stated indicates scrofulous tendency, probably inherent, (which often occurs) and the birds should be no longer used. The exclusive feeding of carbonaceous food has thrown the whole flock out of condition, making them more liable to disease.

FERTILIZER QUERIES.

E D. G., Ashburnham, Mass.—1. My soil is an upland, neither clayey nor sandy, but just medium; can I use a better top-dressing for grass than ground bone with muriate of potash? Would fish and potash be a good application? 2. What is the best manure for oats to be cut for hay just as they begin to head? 3. What would be the best fertilizer for flat turnips put in on sod lands in August? 4. In a favorable season could I reasonably expect 200 bushels of turnips per acre from an application of a ton, per acre, of high-grade potato fertilizer, or would bone and potash be better? I shall seed to Timothy and Red-top or Blue grass. 5. For one who doesn't want to use more than from 1,000 to 2,000 pounds of commercial fertilizer is it advisable to buy the raw materials? I can get them as easily as the prepared article.

ANS.—1. Not unless you substitute sulphate for muriate. The mixture would be deficient only in nitrogen Fish might be advantageously added. 2. In the absence of any information as to what your soil needs, we would answer, superphosphate (dissolved bone) three parts, potash one and nitrogen (nitrate of soda) one. 3. A complete high-grade fertilizer strong in phosphate. 4. The potato fertilizer is needlessly strong in potash. 5. No, we would buy the prepared fertilizer in such a case.

ABOUT POTATO PLANTING.

J. H. N., Afton, N. Y.—1. I am going to plant about 14 acres of potatoes on a sandy loam upland. The White Star and Burbank are the kinds mostly raised in this section; would the RURAL advise me to plant those or some other varieties, and what kind would it advise? 2. How many bushels shall I allow to the acre, and if cut how many eyes to the hill? 3. Would wood ashes be good as a fertilizer? 4. I am also going to sow about 20 acres of spring wheat on the river flat a part of which is very rich land. I intend to top-dress the rest with about 20 loads of fine manure to the acre; what kind of spring wheat shall I sow and how much to the acre?

ANS —1. It will be safer to plant potatoes that you know do well on other farms near you, than to try experiments. New varieties ought always to be tried on small areas. 2. If you cut medium-sized potatoes, having a medium number of eyes, and plant one by three feet apart, you will need 12 bushels. Not less than two strong eyes. Give all the flesh possible. 3. Yes, a splendid fertilizer but one-sided. On your land, add raw-bone flour —400 pounds to the acre. Sow broadcast. 4. We prefer not to advise in the matter of spring wheat.

FEED FOR EWES AND LAMBS.

J. H. K., Pompey, N. Y.—I can buy buckwheat middlings quite free from hulls for $15.00 per ton; they seem quite rich and oily; also wheat shipstuff, buck-wheat flour "which has been heated just enough to spoil it for family use," mixed half and half for $18 00: also ship-stuff (clear) and corn-meal. Which is the cheapest feed or feeds for ewes and lambs the object being to make the lambs fat as fast as possible, beets to be fed in connection with the grain and clover cut fine, all being mixed and fed together as cut feed?

ANS.—Sheep masticate their food better than the larger animals and for this reason the buckwheat middlings which contain the bran of the grain (not the hulls) will be the best of the foods mentioned. But moderation must be exercised to avoid over-feeding grain food to lambs. Begin with four ounces a day per head and do not exceed eight ounces. Buckwheat hulls with the large proportion of cracked grain usually mixed with them make an excellent food for sheep, but as they are rich in nitrogen they will be apt to cause heating and shedding of the wool if fed too liberally. At the prices mentioned the buckwheat middlings are cheaper than corn.

LAMENESS IN A HORSE: SPRAIN OF BACK.

F. C. F., Mobile, Ala.—My horse got lame in the loin about four months ago while grading with a scraper. I have blistered him but he seems to have got little if any better. Is there anything that I can do for him?

ANS.—How do youknow the lameness is in the loin? Is there any tenderness along any part of the loin when pinched,or any difficulty in backing? Does there seem to be any pain or difficulty in arching the back to urinate? Can the animal turn quickly in a circle, one way as readily as the other? You should have given a careful description of all the symptoms, so that we may be sure your agnos s is correct. suspect you have not discovered the true seat of the sprain. If the sprain is of the loin, the horse should not be allowed to get down and up. Tie the head from above so that he cannot get his head within two feet of the floor. If weary, place a sling under him so that he can stand on his feet or rest in the sling at pleasure. Repeat the blister over the loins. Allow daily walking exercise only for three to six weeks.

AN AILING HEIFER.

D. W., Benton, La.—My two-year old heifer got quite poor last fall. She has been up and fed now for some time, and has improved somewhat, but she is still weak and stiff in her feet which are large and flat. Her appetite is good now. Her bowels were loose for a while and she passed some bloody mucous stuff; but her bowels are all right now. What ails her?

ANS.—Your history and symptons lead us to suspect that the poor condition of the heifer was due to neglect and want of suitable food rather than to any particular disease. One would not expect the heifer to thrive on ticks and acorns. If she continues to improve medicinal treatment will not be necessary. See that the heifer is well cared for. Feed generously, and make sure that the food and drinking water are both of good quality. If the hoofs are overgrown they should be trimmed. An occasional dressing of pine tar would favor a better growth of horn.

ABOUT CHURNS.

C. B., Chemung, N. Y.—Can better butter be made by churning in any of the new kinds of churns than by the old dash churn; or, in short, is there any better churn than the old dash churn?

ANS.—Yes. The fact that, almost without exception, the people who make the butter that brings the highest price, use the modern churns is a pretty good argument in their favor. We have found churning with the newer churns easier than with the old-time affair, and it is beyond all question that the newer churns will permit a far better observation of the cream during the churning. It is true that many good dairy folks still make excellent butter with the old dash churns. We can only say that we believe they would make still better butter with one of the newer churns. We hope to publish soon an article giving the chief points of superiority of the four distinct classes of churns—the agitator, the barrel, the box and the dash.

COTTON-SEED AND COTTON-SEED MEAL AS FEED.

S. A. L., Mooresville, N. C.—Which is the cheaper feed for milch cows—cotton seed at $11 per ton, or cotton-seed meal at $22? There will be plenty of wheat bran, corn-meal and shorts in either case.

ANS —Cotton seed contains about one half its weight of useless if not injurious substance. The husk is hard and indigestible unless it is ground fine and the lint attached to the seed is apt to form masses in the intestines which may cause serious trouble. The excess of oil in the whole seed is also an objection to its use. When well boiled, however, the whole seed has been used without any injurious results, but the labor of boiling is both costly and troublesome. Hence the meal freed from husk is the cheaper and better feed for cows. Wheat bran would be the best food to mix with the cotton-seed meal in the proportions which have been so often mentioned in this department.

PREPARING A FIELD FOR FALL SEEDING.

P. M. H.,New Paltz, N. Y.—I have a field which was sown with oats last year, but was not seeded. What grain crop can be most profitably grown on it with the view of seeding it or preparing it for seeding in the fall? It is high ground. The soil is loam with clayey subsoil, and is rather light. How much fertilizer should be applied and how?

ANS —To get the land into good condition for fall seeding, the best crop to raise next summer would be German millet sown broadca t, early in June, at the rate of one bushel to the acre so as to have it grow fine for hay. This can be cut early in September and then the land can be plowed, harrowed, seeded and rolled at once so as to get the advantage of the autumn rains: 500 pounds of good superphosphate per acre should be sown on and bushed in with the millet. Should the millet be fit to cut for hay earlier than September, so much the better.

RAISING POTATOES FROM SPROUTS.

E. H. L., Athens, Ga.—A late RURAL says the best way to obtain the largest yield of potatoes is to sprout the "seed" in a hot-bed and plant the sprouts out until the "seed" tuber is exhausted. Will the RURAL give full particulars?

ANS.—Cut the potato into single eyes with all the flesh to each possible. Plant each piece three inches deep in the hot-bed. As soon as the sprouts are two or three inches long cut them off just above the seed-piece and *plant* these cuttings. Some shade and sufficient water will be required. The seed-piece will continue to throw up shoots which may be treated the same as the first. When these shoots shall have become established, cuttings may be taken and rooted in the same way. This process of propagation may be continued even after the sets are planted out-of-doors up to about the last of May or June first.

BLOODY MILK.

A. C. F, Capac, Mich.—I have a heifer that gives bloody milk out of one teat at times. She is all right for three or four days and then she gets bad again; the last milk drawn from her bag is bloody. She is otherwise in good condition and well fed. What can be done for her?

ANS.—Drench the heifer with one pound of Epsom salts and one ounce of ginger dissolved in a quart of warm water. If this does not move the bowels in 24 hours, repeat the dose. Then give one table-spoonful of pulverized saltpeter night and morning in the feed. Bathe that quarter once daily with camphorated spirits. If you are feeding much grain it would be well to reduce the feed until the trouble is over. A thin bran mash or other sloppy food at least once daily would be excellent.

A FERTILIZER.

J. E. D., Little Cooley, Pa.—1. A phosphate is being sold here which has the following ingredients: 1,700 pounds of South Carolina rock; 200 pounds of potash; 100 pounds of ammonia. Is this a good fertilizer for common use? 2. Would the same amount of gypsum be as good as South Carolina rock?

ANS —1. The proportions of plant food are good enough. The South Carolina rock, unless dissolved in sulphuric acid, is insoluble. The ammonia may or may not be soluble. The potash may be sulphate or muriate. It is impossible to give any correct estimate of the value of the fertilizer. 2. No, the gypsum will furnish lime alone. The rock furnishes phosphoric acid.

GROUND AND UNGROUND GRAIN AS FEED.

L. H., Dansville, N. Y.—What is the difference in value betweeen whole grain and the same ground as feed for stock?

ANS.—This is a question of digestibility of the food. Generally in feeding whole grain one-half or more is wasted and ejected in the manure. If the grain is finely ground nearly the whole is digested, and less as the meal is coarser. As a rule for feeding cows, cattle and horses, when economy is an object, the grain should be ground as finely as possible and fed with cut hay, in sufficient quantity to insure mastication and proper salivation. The latter is very important as the salivary fluid is a digestive agent and prepares the food for the action of the gastric fluid.

RAWLE'S JANET AND STARK APPLES.

E. A. T., Croton, Ohio.—What is a description of Rawle's Janet and the Stark apple?

ANS.—Rawle's Janet originated in Virginia. It is quite large, oblate-conic; of a yellow color shaded and striped with red. The flesh is a yellowish-white, juicy tender, sub-acid. Its season is late winter. The tree is hardy, vigorous and productive. It thrives well in the Southwest. The Stark is a large, striped, coarse, sub-acid winter apple of fair quality. It is valued as a keeper. It originated in Ohio.

A COW BEST FOR THE BUTCHER.

J. D. B., Modus, Conn—What is the best feed for a heifer coming in in May? She will be two years old in April and is quite fat though she has been fed no grain this winter. I wanted to feed bran, but was advised not to do so as she was so fat.

ANS.—This heifer is not promising for a cow, as milk and a fattening proclivity do not go together. Evidently she is in no want of special feeding; an animal that will fatten on hay would get still fatter on bran.

Miscellaneous.

A. H. H., Brunswick, Me.—When should I trim apple trees?

ANS.—At once.

W. C. R., Bridgewater, Vt.—What is the inclosed bean?

ANS.—This is the old Dun-colored bean known to seedsmen for the past 75 years.

J. B. W., Charlton, Mass.—Where can I get Stachys tuberifera, and at what price?

ANS.—We find it in Thorburn's catalogue, page nine, at 10 cents per ounce (the roots) or one dollar per pound.

E. C., Berlin, Conn.—Where can I get Consular Reports 99 and 100.

ANS.—These books are published by the Department of State, Washington, D. C. They will be sent to any address.

F. O. C., Washington, Kan.—My 2,000 grape-vines as well as my raspberry vines are covered with tree cricket eggs; how can I get rid of them?

ANS.—Cut out the infested canes and burn them now.

J. T. E., Sharptown, Md.—Who are reliable commission men who sell fruit in New York and Philadelphia?

ANS.—S. H & E. H. Frost, 100 Park Place, E. & O. Ward, 279 Washington St., New York; Warren Harper, Bro. & Co., Philadelphia.

E. H, Utica, N. Y.—Where can I get the Cloud's Seedling, Parker Earle and Hilton strawberries?

ANS —Cloud's Seedling, from A. B. Coleman, Princeton, Ky.; Parker Earle, from T. V. Munson, Denison, Texas; Hilton, from W. W. Alley, Hilton, New Jersey.

W T. S, Greene Co., N. Y.—What are the earliest good potatoes?

ANS.—Nott's Victor is an early variety. Early Ohio should be tried; also White Early Ohio, (T. C. Davenport 124 Dock St., Philadelphia, Pa.) Crown Jewel is sold by Johnson & Stokes, Philadelphia, Pa.

H. S., Marlboro, Ohio.—1. How can I get most plants for next year's planting from a given number of blackberry plants purchased this year? 2. How many Ancient Briton blackberry plants must I purchase this year to have 200 next year?

ANS.—1. By root cuttings. 2. We should say about a dozen.

H G.,Hamburg,Conn.—Where can I get the Paragon chestnut, the Parker Earle strawberry, and the Crown Jewel potato? Is the last early and productive?

ANS.—The Paragon can be got from H. M. Engle & Son, Marietta, Pa.; the Parker Earle strawberry originated with T. V. Munson of Denison, Texas. We cannot speak positively as to the Crown Jewel. See second answer above.

L. M. W., Shelbyville, Ill.—1. Will seeds from the Wild Goose plum produce trees which will bear fruit of the same quality? 2.

What slope is most desirable for grapes, peaches and pears?

ANS.—1. Seedlings do often come quite true. But they cannot at all be depended on so to do. 2. A slope sufficient to insure thorough drainage—nothing more.

G. A. S., Hubbardston, Mich.—1. I have a Bartlett pear that sprouts from the roots six feet from the trunk; how can this be prevented? 2. Do pear trees need trimming the same as apple trees?

ANS.—The R. N.-Y. is of the opinion that the sprouting of the roots is due to one of two causes, viz: either the main stem (trunk) is injured in some way so as to molest the sap, or the soil is too poor. 2. Yes, essentially the same.

A. A. C., Christiana, Del.—I wish to effect an early and rapid growth of feed for cows, as I have not much pasturing; could millet or Hungarian be sown this early or are there other grasses that could be utilized more successfully? The ground is in elegant condition and I am very extravagant in the use of barn-yard dressing and fertilizers?

ANS.—Yes, it could, but millets require a deal of heat to make a good crop. We should choose oats or rye.

J. W. C., Halifax, Pa.—1. I have a number of young cherry trees that grew from the seed. Should I transplant and then graft them or graft first? 2. Would they be of any value for fruit if they were not grafted at the proper time?

ANS.—The R. N.-Y. would transplant first and the year after graft. 2. Probably not. The chance of obtaining a cherry superior to existing kinds from the seed is remote. Still all improvements must come in that way. Graft the cherry very early. It is time now.

N. R. T., (No address). I have been drawing out all winter the manure from nine cows and two horses on a piece of June-grass greensward that was plowed last November and which was intended for potatoes. Unless the manure is buried quite deep, it will, I fear, cause the potatoes to be scabby; is there a harrow that will bury it deep enough. Should I apply superphosphate in addition to the manure?

ANS.—We do not know of any harrow that would bury it. The Acme would come the nearest to it. We should use, in addition to the manure, a liberal quantity of high-grade potato fertilizer.

A. A. G., Janvier, N. J.—I have a quantity of plum and apple stocks to graft this spring and I wish to know how to manage the cions. 1. Would it be best to take them off now and bury them in the ground or leave them until grafting time on the trees? Our cellar is too warm for keeping them. 2. Can I move the stocks before grafting? I wish to graft the Wild Goose on the wild plum stock. 3. Is the Fay's Prolific currant all that George S. Josselyn claims for it?

ANS.—Yes; cut the cions when not frozen and bury them. 2. R. N.-Y. would graft them where they are. 3. Yes, it is as represented.

G. W. S., Parishville, N. Y.—1. What is the best grass to sow with Timothy and Alsike on low land where wild grass is inclined to run out Timothy in a few years? 2. How much of each should be sown per acre? 3. In planting the Rural Thoroughbred Flint corn for fodder, how far apart should the hills be, and how many kernels should there be in a hill?

ANS.—1. We know nothing better than Red-top. 2. Half a-bushel if sown alone of Timothy; two bushels of Red-top; eight pounds of Alsike. These may be moderated in quantity when sown together, as desired. 3. For fodder the hills should be about three by two feet. *One* plant to the hill will be enough.

"Truth-Seeker," Mount Pleasant, N. Y.—1. What is the quality of the Carlough apple? 2. How about the Delaware Red Winter apple? Some pronounce it identical with the Lawver. 3. In what does the Monroe Seedling differ from Sibley's Monroe County Prize or the White Seedling introduced by Sibley two years ago? 4. Is the Crandall currant in any way superior to the Missouri Black or Fragrant currant?

ANS.—We do not know. It is valued chiefly as being a long keeper. It is a sweet apple. 2. It is thought to be the Lawver. 3. We were supposing them to be the same. 4. The R. N.-Y. has ordered a plant and will report in due time. Meanwhile we must depend upon others' reports.

S. H., Overton, Md.—Will you please advise me what seed I should use for my lawn without buying the expensive mixtures advertised in catalogues, which are beyond my means. There is a fair stand of White clover on it now; will a vigorous harrowing be sufficient to catch the seed, followed by a heavy rolling? Ought I to work around my shade and nut-bearing trees, and will it benefit them to spade in stable manure at this time? Which is the more productive potato—Burbank or Beauty of Hebron?

ANS.—If you would have a fine lawn, the soil must be suitably prepared by plowing, manuring, harrowing and leveling. If the soil is moderately rich, you may, as you suggest, harrow it thoroughly and the seed will no doubt sprout after the surface is rolled. The costly lawn mixtures contain just two kinds of seeds which are of the first value, viz., Blue grass and Red-top. Either of these (or both) will give you as fine a lawn as the costliest "mixtures." Red-top will cover the soil as soon as Timothy. Blue grass is later in starting. 2. Burbank.

W. F. S., Taylor's, Md.—I am milking several good cows and although they are well fed and properly cared for, their flow of milk is unaccountably diminishing. Immediately after the milk has been brought to the house, it is put on the stove and brought to a "boil." Some of my neighbors say the decrease in the milk production is due to the heating, and that if this is continued, the flow will cease altogether. What does the RURAL say of the matter?

ANS.—How the heating of the milk can affect the flow of it from the cows is a rather mysterious problem. We cannot see any connection between the two. It can be the condition of the cows alone that can account for the failure of the milk and this may be due to several causes. The cows may not have the right kind of food; or they may not be properly milked. A bad milker may totally dry up a cow in a few weeks, and we suspect this may be the most probable cause, and some close investigation should be made into the case. If the feeding and the method of milking were described, there would be some ground to base an opinion upon the matter.

J. B. W., Charlton, Mass.—Last fall I went into the forest and raked off the top leaves and then scraped up the top of the ground filling a barrel with the stuff, and put it in my cellar. I also put in there some fine sand. This spring I shall go to the pasture where cattle are kept and gather some of their droppings, which have been out during the fall and winter and are, of course, somewhat soaked out. I want to mix those three kinds together and use the mixture in small boxes in which I intend to plant flower seeds to get early plants. I shall put the boxes in cold-frames under glass. How much of each kind should I use in mixing and would the same kind of mixture be good for pots for plants?

ANS.—The R. N.-Y. would not advise that the cow droppings be used. They will make the soil spongy, while their decomposition will be very slow. Only decomposed manures should be used for the purpose indicated. The forest soil is excellent. Ten parts of it to one part of sand would be about right. Rich soil from under fences or from the garden might well be added. This mixture would serve for pots as well.

W. J. H., Shelby, O.—How can I kill cutworms, wire-worms and red ants that are so troublesome to young growing corn? Is there any fertilizer or other substance that can be applied to keep them off?

What Others Say.

RESULTS OF EXPERIMENTS AT ROTHAMSTED (ENGLAND) ON THE GROWTH OF POTATOES FOR TWELVE YEARS IN SUCCESSION ON THE SAME LAND.

Dr. J. H. Gilbert, Dr. Lawes's associate, in a lecture before the Royal Agricultural College, speaks at considerable length upon the above subject. It is reported in the Agricultural Students' Gazette, a copy of which has been forwarded to us by Dr. Lawes.

His special object is to show the general requirements of the crop, both actually and as compared with other crops, and the actual and comparative characters and composition of the product obtained. He draws his illustrations mainly from the results of field experiments on the growth of the potato by different manures, for a number of years in succession on the same land, at Rothamsted, and from those of collateral investigations into the composition of the produce, made in the Rothamsted Laboratory.

The first table (we cannot present it) shows that, without manure, with common ammonium salts alone, and with nitrate of soda alone, the average produce of tubers was less over each succeeding period of four years. On the other hand, with the superphospates alone, with the mixed mineral manure alone, with the ammonium salts and mixed mineral manure together, and with the nitrate of soda and the mixed mineral manure together, there was more produce over the second four years than over the first; but there was a marked reduction over the third four years. It is evident, therefore, that the falling off over the second four years in the other cases was not to be accounted for by less favorable seasons only. The conclusion is rather that by the continuous growth of the crop without manure, or by nitrogenous manure alone, the available supplies of the necessary mineral constituents within the soil, became relatively deficient.

The average produce over twelve years without any manure, is not quite two tons per acre; and there was a considerable decline from period to period under this exhausting treatment. Nevertheless, this low yield without manure, for twelve years in succession on the same land, is about as much as the average produce under ordinary cultivation in the United States, and nearly two thirds as much as in some important European countries. By superphosphate of lime alone the produce is raised from an average of scarcely two, to nearly 3¾ tons; and by a mixed mineral manure, containing, besides superphospbate of lime, salts of potash, soda, and magnesia, to just over 3¾ tons, that is, to very little more than by the superphosphate alone. It is evident, therefore, that up to this amount of production, the character of the exhaustion induced by the growth of the crop on this land, which was, agriculturally speaking, in a somewhat exhausted condition, was much more that of available phosphoric acid than of potash, or the other bases. It is remarkable that there is much less increase of produce of potatoes by nitrogenous manures alone than by mineral manures alone.

Thus, by ammonium salts alone there is an average produce of scarcely two tons six cwts., or only about six cwts. more than without manure; and with nitrate of soda alone there is an average of only two tons 12½ cwts. per acre. The better result by nitrate of soda than by ammonium salts is doubtless due to the nitrogenous supply being more immediately available, and more rapidly distributed within the soil, and so inducing a more extended development of feeding root.

These negative results by the nitrogenous manures alone, confirm the conclusion that by the continuous growth of the crop on this land it was the available supply of mineral constituents within the root-range of the plants, more than that of nitrogen, that became deficient.

The last two lines of the table show, that with the mixed mineral manure and ammonium salts together, there was an average of about six tons 14½ cwts., and with the mixed mineral manure and the same amount of nitrogen as nitrate of soda, an average of six tons 13 cwts.; that is, nearly twice as much as with the mineral manure alone, and much more than twice as much as with the nitrogenous manure alone.

* * * The fact is, that it is only the comparatively small proportion of the nitrogen of farm-yard manure which is due to the liquid dejections of the animals, that is in a readily and rapidly available condition; whilst that due to more or less digested matter passing in the fœces, is more slowly available, and that in the litter remains a very long time inactive. Hence, the addition of nitrogen as nitrate of soda to the farm-yard manure had a very marked effect.

* * * The summary shows that the proportion of diseased tubers was the greater, the greater the amount of nitrogen supplied, the greater the luxuriance. * * *

Upon the whole, it is obvious that, in the case of this somewhat agriculturally exhausted arable land, mineral manures alone had more effect than nitrogenous manures alone; but that, mineral constituents being adequately supplied, the further addition of nitrogenous manures was essential to obtain anything like full crops. * * *

It is of interest to observe that the amount of disease was not enhanced by the continuous growth of the crop on the same land, as is frequently assumed to be the case. * * *

But little is definitely known of the special function of individual mineral constituents in vegetation. It is, however, pretty clearly established that the presence of potash is essential for the formation of the chief non-nitrogenous matters—starch and sugar. The published results of experiments at Rothamsted have shown that the proportion of potash in the ash of wheat was the greater, the better matured the grain—that is the larger proportion of starch it contained; and here in the potato we find a greatly increased amount of potash in the heaviest crops, that is to say, in those in which the largest amounts of starch have been formed.

The accumulation of phosphoric acid, on the other hand, is more directly connected with the assimilation of nitrogen, and the formation of the nitrogenous compound. * * *

It will be remembered that the quantity of farm yard manure annually applied per acre was estimated to contain about 200 pounds of nitrogen, besides a very large amount of mineral constituents. Yet, in no case was the increased yield of solid substance in the crop so great as was obtained by an artificial mixture of mineral and nitrogenous manure, supplying only 86 pounds of nitrogen, but in a more readily available condition. Nor was the increased assimilation of any one of the individual constituents, so great under the influence of the farm-yard manure, as when they were applied in the rapidly available condition, as in the artifical mixtures.

In the case of other crops it has been found that only a small portion of the nitrogen of farm-yard manure was taken up in the year of the application. But these results seem to indicate that the potato is able to avail itself of a less proportion of the nitrogen of the manure than any other farm crop. Yet, in ordinary practice, farm-yard manure is not only largely relied upon for potatoes, but is often applied in larger quantity for them than for any other crop. It is probable that, independently of its liberal supply of all necessary constituents, its beneficial effects are in a considerable degree due to its influence on the mechanical condition of the soil, rendering it more porous and easily permeable to the surface roots, upon the development of which the success of the crop so much depends. Then, again, something may be due to an increased temperature of the surface soil engendered by the decomposition of so large an amount of organic matter within it; whilst the carbonic acid evolved in the decomposition will, with the aid of moisture, serve to render the mineral resources of the soil more soluble.

In countries where the potato is largely grown for the manufacture of starch or potato spirit, the specific gravity serves as an important indication of quality. The higher the specific gravity, the greater, as a rule, is the proportion of dry matter, and the greater the proportion of starch. Indeed, tables are constructed for the calculations of the percentage of dry matter, and of starch, from the specific gravity of the tubers. * * *

The general conclusion to which these calculations as to the distribution of the various constituents of potato tubers leads is—that from 80 to 85 per cent., or even more, of the total nitrogen of the tubers may be in the juice, and that about the same proportion of the total mineral mattter also may be in the juice. Further, that about the same proportion—80 to 85 per cent.—of the total potash, and about two-thirds of the total phosphoric acid, are in the juice. And when it is borne in mind that two-thirds, or more, of the nitrogen existing as albuminoids, is in the juice, it is obvious that if the mode of cooking the potato is such as to exclude the constituents of the juice from the final food product, there is considerable waste of nutritive matter; and that, indeed, the proportion of albuminoid matter in the food is exceedingly small. When potatoes are used as a mere adjunct to an otherwise liberal diet, the general practice is to cut off the rind, and to put the peeled potatoes into cold water, by which a large proportion of the soluble albuminoid matters must be washed out, before the temperature of the water becomes sufficiently high to coagulate and fix them. A very large proportion of the potash must also be washed out under such circumstances. When, however, potatoes constitute an important item in the diet, as in the rural districts of Ireland, for example, it is usual to boil them in their skins—or, as is said, in their jackets. Under such circumstances, certainly a much larger proportion of the albuminoid matter will reach the stomachs of the consumers; and doubtless much more of the potash and phosphoric acid also. Still, it is obvious that a potato diet must be very deficient in the proportion of nutritive nitrogenous compounds.

* * * The produce of dry substance of tubers was, without manure, 1,353 pounds per acre; with purely mineral manure 2,384 pounds; and with the mixture of the mineral and nitrogenous manures ("complete") more than 4,000 pounds per acre.

Potatoes are reckoned to contain on an average more than 21 per cent. of starch.

The produce of starch per acre is 1,120 pounds without manure, and 1,988 or nearly 2,000 pounds with purely mineral manure—

that is without nitrogen. The amount with purely nitrogenous manure is not so great as that with purely mineral manure. But with both nitrogenous and mineral manure ("complete") the quantity of starch is raised to an average of about 3,400 pounds, or about 1½ ton per acre. * * *

As, then, the root-crops are essentially sugar yielding crops, so the potato is essentially a starch-yielding crop; and it is seen that, provided the mineral constituents are not deficient, the produce of both sugar and starch is greatly increased by the amount of nitrogen available to the plant within the soil, whether derived from previous accumulations, or from nitrogenous manuring. * * *

The United States, with nearly four times the area under the crop, but only about 1¼ time as much aggregate produce as Great Britain, yields an average of less than two tons per acre, or less than one-third as much as Great Britain.

Here, then, of 13 countries where the potato is largely grown, their aggregate area under the crop being about 21 million acres, and their aggregate produce about 61 million tons, there is not one that reaches the average produce, per acre, of Great Britain. Norway, Belgium, and Holland most nearly approach its yield, and it is of interest to observe that these, and Denmark, are the countries that most nearly approach the United Kingdom in yield per acre of wheat and barley also.

It is, then, only the countries of small total area, and of small area under the crop, that at all nearly equal England in yield per acre; and among them Belgium and Holland, the second and third on the entire list, more nearly approach it than any other, in *density of population*, and in *the amount of live stock kept per acre*, and consequently in the supply of *manure*. Both these countries, too, have good home markets, besides their exports of agricultural produce.

WESTERN FARM LOANS.—There appears to be a growing distrust of the safety of Western farm loans among conservative monied men and institutions in the East. While the savings banks of some of the New England States have lent a great amount of money on Western farm mortgages, the saving institutions in Massachusetts are not allowed to invest in such securities. The trust companies, however, have the privilege; but all except two of the large number have purposely refrained from exercising it. Bradstreet's says the president of one them before a committee of the legislature, said last week that "within five years there will be one of the biggest panics in the Western farm securities, that we have had for a long time." Meanwhile, however, private capital is going West on farm mortgage loans in increasing amounts, as the interest is much higher than Eastern rates. The Massachusetts savings bank commissioners hold that the trust companies as well as the banks should be forbidden to make such investments. A telegram to Bradstreet's from Kansas City announces that some investment loan companies are withdrawing from Kansas as the rate of legal interest has been reduced there, and the laws of the adjoining States are more satisfactory to them.

SUCCESS OF SORGHUM-SUGAR IN KANSAS.—The sorghum-sugar works at Fort Scott, Kansas, are said to have cleared $30,000 net profit in six weeks' work last year. The scale of operations at the concern's works at Fort Scott and Topeka are to be greatly enlarged, and three large new mills are to be constructed in the Southwestern part of the State—one at Meade Center, another at Arkalow, and the third at Liberal on the borders of No Man's Land. The surrounding country at each place is particularly well adapted for sorghum growing. A wet or dry season makes little or no difference on sorghum-sugar making. A number of U. S. Senators interested in the business are urging the retention of Ex-Secretary Colman by the new Department of Agriculture to take charge of the sorghum-sugar industry, for the advancement of which the last Congress appropriated $85,000. The National sorghum experiment station at Fort Scott was discontinued some time ago owing to the dispute between Professor Magnus Swenson, Chemist of Parkinson's sugar works, and the Government about the ownership of the patents taken out by Swenson for a method of making sugar which he discovered and patented while in the employment of the Department of Agriculture. It is claimed that his discoveries should be public property as they were made at public cost; but they are being used by the Parkinson sugar works for their own private profit. There are two National Sorghum Experiment Stations in Kansas, however, one at Conway Springs, and the other at Douglas, and it is proposed to start three more, and divide the entire appropriation of $85,000 among them.

FINALLY.

PROFESSOR GOFF tried the new tomato Ignotum of Prosessor Bailey. Some of the tomatoes were all that could be desired for quality, but others were too small to be of value. The variety is not yet well fixed.....

STACHYS TUBERIFERA, the new vegetable illustrated recently in these columns, bore tubers at the New York Experiment Station scarcely larger than acorns.....

A CHEMICAL dehorner for cattle is being widely advertised of late. We also notice the statement that "a single application of caustic potash will prevent the growth of the horn." Get a five-cent stick at the drug-store and keep it in a corked bottle so it will not "air-slake." On the arrival of a calf which you wish to be hornless, wrap a piece of paper around one end of the stick of caustic, and with it in one hand, take the calf between your knees, wet the hair over the "horn spots," rub the uncovered end of the caustic well on the spots, let the calf go, and according to the Maryland Farmer, it will grow up a polled Jersey, Holstein, or scrub.....

PLANT peas—the earliest kinds. Farmers as far north as Long Island were planting them two weeks ago.....

PLANT asparagus sets.....

TAKE cuttings of grape-vines and place them in the soil at an angle of 45 degrees, firming the soil about them.....

PREPARE for sweet corn—Let the harrowing be thorough. Spread your fertilizer before the last harrowing. Plant earliest, intermediate and late varieties at the same time. Reserve the intermediate kinds for later planting.....

THE open season has given us muddy roads during a greater part of the past winter. The paths and carriage-way of the Rural Grounds have been a puddle of mud so nearly impassable that the grass margins have been selected for passage to and fro, much to their injury. We are now macadamizing a portion of the road and paths as an experiment. They are dug out a foot deep; earth is then spread over the stones an inch or so deep and over this two inches of the macadam finish the job. The macadam consisting of a yellowish stone in part broken into small bits and in part almost a dust, is brought three miles by rail and one by hauling. The cost per 100 feet (10 feet wide) of the entire work is found to be $40 .....

EVIDENCE accumulates that the new Erie is the old Lawton blackberry—a fact, if it be a fact, that the R. N.-Y. could not have discovered, because it had never cultivated the Lawton until it tried the Erie.....

SAMUEL MILLER says, in Popular Gardening, that the pecan does not succeed on the hickory.....

MR T. GREINER says, in Popular Gardening, that the Ironclad is a wonderful grape. At its home in South Jersey it ripens about the last week of September, but colors early like Ives. One tea-spoonful of its juice in a tumbler of clear water colors it a deep purplish pink, two tea-spoonfuls give it a most beautiful royal purple. The vine seems to be disease-proof, as there is no identified case of the Ironclad being affected by rot. The R. N.-Y. would be glad to secure a vine of the Ironclad.....

THE good Mr. P. Barry shows his interest in the Western New York Horticultural Society in a valid way. He presents it with $2,000...

THE Sibley squash is praised on all hands..

THE R. N.-Y. deprecates the necessity of spraying apple trees with liquid poisons. Will the apples thus raised pay for the probable destruction of the birds?.....

THE Green Mountain is mentioned as the best early white grape..... .....

THE R. N.-Y. ventures to predict a very dry season—for the East at least ... .

WORD FOR WORD.

——N. Y. HERALD: "THE SHAD IN SEASON.—The fish was delicious, and the two epicures relished it to the fullest extent, but he of the pessimistic turn remarked:—

'Shad always suggests to me the idea that nature was in a hurry when she got to that part of her work, took a lot of excellent material and just pinned it together.'

'Ah!' said the optimist, 'you can't have seen the poetical version of the matter.' Then he recited:

'When the angels made shad
The devil was mad,
For it seemed such a feast of delight;
So, to ruin the scheme,
He jumped into the stream
And stuck in the bones out of spite.
When the strawberry red
First illumined its bed
The angels looked down, and were glad,
But the devil, 'tis said,
Fairly pounded his head,
For he'd used all his bones on the shad.'"

——CORRESPONDENT IN POPULAR GARDENING: "The common water lilies may be grown in any door-yard to perfection. I have a neighbor, a lady of great taste, Mrs. Owen Root, who has them in profusion. You must first secure a few tubs that will not leak, and will hold half a barrel, plant them in the ground nearly or quite to the top. Place in each tub six inches of soil or any good garden sod, plant in this a large piece of lily root, then fill up with water. Keep the tub full as it evaporates, and you have nothing more to do. In the fall lift the tubs and store in a cellar where they will not freeze. You can pour off the water and leave the roots nearly dry all winter; when a tub is crowded with roots divide, but they blossom best with the tubs well filled."

——LIFE: "'I'm afraid you are going to be bad' as the old hen remarked to the egg that would not hatch."

——N. Y. TRIBUNE: "Intermittent bad temper is an expensive as well as a waspish thing to carry about one's person; but, says 'The Western Rural,' the farmer who is 'chronically mad just throws away money.' His hired help do less work; cows are afraid to give the most milk; horses jump when they hear him coming, and for every jump he must feed more oats."

——PHILADELPHIA PRESS: "I can corroborate Friend Massey's statement that peas will bear a hard frost without injury. I always plant just as soon as the land can be worked, and almost every spring the ground freezes hard after they are up. I have known the mercury go to eight degrees when peas were showing in the row. Only once in 25 years have my peas been damaged by a freeze, and that was in April, 1882. The first week in that month the mercury reached 80 degrees on three successive days and on the 8th it was at 20. Peas were just blooming, and so tender on account of the unseasonably warm weather, that they were badly damaged, but not ruined."

——NATIONAL STOCKMAN: ALSIKE CLOVER.—"It has proven the most hardy of all the clovers. On rich, low, moist soils it yields an enormous quantity of hay or pasture, and may be cut twice each season. It forms a thick bottom, and when sown with oats in the spring very seldom fails to take firm hold. Almost all farmers keep a few stands of bees, and such will find the Alsike to be of very great value. Alsike clover is also of very great value to brood sows. In ordering seed be sure to ask for 'extra cleaned.' Sow at the rate of eight pounds to the acre. As hay for winter all classes of stock are fond of it, and as a green food for silos none that I know of can surpass it."

For Dyspepsia

Use Horsford's Acid Phosphate.

DR. J. J. MCWILLIAMS, Denison, Ia., says: "I have used it largely in nervousness and dyspepsia, and I consider that it stands unrivalled as a remedy in cases of this kind. I have also used it in cases of sleeplessness, with very gratifying results."—*Adv.*

Miscellaneous Advertising.

Dyspepsia

Does not get well of itself; it requires careful, persistent attention and a remedy that will assist nature to throw off the causes and tone up the digestive organs till they perform their duties willingly. Among the agonies experienced by the dyspeptic, are distress before or after eating, loss of appetite, irregularities of the bowels, wind or gas and pain in the stomach, heart-burn, sour stomach, etc., causing mental depression, nervous irritability and sleeplessness. If you are discouraged be of good cheer and try Hood's Sarsaparilla. It has cured hundreds, it will cure you.

Hood's Sarsaparilla

Sold by all druggists. $1; six for $5. Made only by C. I. HOOD & CO., Lowell, Mass.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

$20 FENCE MACHINE FOR $10

Freight paid. *Guaranteed.* Hundreds in use. Circulars free. S. H. Garrett, Mansfield, O.

THE CAUSES OF DEATH.

OUR readers are doubtless all familiar with the Robinson poisoning cases, which have recently come to light in Somerville, Mass., a suburb of Boston.

It seems that eight deaths have occurred from arsenical poisoning, seven in one family, and within five years. It is doubtful if the murderers would have been brought to justice had not an organization in which the victims were insured began an investigation as to why so many persons had suddenly died in one family.

But the sensation from a medical point of view connected with the case, took place in Boston at a recent meeting of the Massachusetts Medico-Legal Society, when it was stated by Dr. Holt that there was general ignorance of the sypmtoms of arsenical poisoning and because of such ignorance the Robinson poisoning cases had gone on without arousing the suspicion of medical men. The Robinson cases were all treated by regular phsicians, with correct diplomas, men supposed to know what they were doctoring for, and to know the effect of drugs on certain diseases. Yet in the five deaths from arsenical poisoning of which we speak, certificates of death were given for pneumonia, typhoid fever, meningitis, bowel disease, and Bright's Disease.

Such a commentary on the general ignorance of the medical profession, made by one of its own number, we believe to be without a parallel.

Is it any wonder that patients are losing faith in their doctors? Here were five able-bodied people slowly poisoned with arsenic before their very eyes, and yet these very wise medical men were doctoring them for pneumonia, typhoid fever, meningitis, bowel disease, and Bright's disease.

In the very same manner thousands of patients are being treated this day for pneumonia, heart trouble, dropsy, incipient consumption, etc., when these are but symptoms of advanced kidney disease, which is but another name for Bright's disease. The doctors do not strike at the seat of the disease—the kidneys, and if they did nine times out of ten they would fail—as they are on record as saying they can not cure Bright's disease of the kidneys. Rather than use Warner's Safe Cure, a well-known specific for this and all other forms of kidney disease they would let their patients die, and then give a death certificate that death was caused by pericarditis, apoplexy, phthisis or cardiac affection.

Is this not the honest truth? Do you not know in your own personal history very many instances where physicians doctored the wrong disease, and caused untold suffering, and many times death? Which leads us to remark that very much can be learned by one's-self by careful observation, and that the doctors are very far from having a monopoly of the knowledge of medicine or disease.

SILO AND SILAGE.

This little book describes what is surely going to revolutionize farm methods Its every statement has been proved by the author on his own farm. "It is a missionary for good and ought to be in the hands of every farmer," R. G. Buell. "It is capital, like an egg, full of meat," Col. F. D. Curtis. Mailed for twenty-five cents.

A. J. COOK, Agricultural College, Mich.

IVES' THOROUGHBRED BRAHMAS.

Having bred Light Brahmas for the past 40 years I pride myself in having as pure and fine stock as any in this country. Also White and Brown Leghorns—"Superior Stock." Eggs $2 per doz., or three doz., $5.

JOHN S. IVES, Salem, Mass.

Poultry Supplies.

Such as **Ground Beef Scrap, Granulated Bone, O. Shell, Bone Meal, Animal Meal,** etc. For prices and particulars send for my Circular. Rendering Works and Mills, Worcester, Mass.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, APRIL 6, 1889.

MR. T. C. DAVENPORT, of Philadelphia, Pa., writes us that the State of Maine is the best late potato he knows of.

"*What informed farmer will continue to let 360 pounds of water fall on each square foot of the barn-yard when it usually contains three to five times as many tons as his hay mow, each ton of which, if it is properly made manure, is worth $3.00?*"—PROF. I. P. ROBERTS, page 232.

MR. ALEXANDER says that the Early White Ohio (not the Early Ohio), is beyond doubt the finest table potato he ever tasted. We have heard the same from others.

"*So terrible is this evil, when it comes, that I think, if necessary, it would be wise and very desirable to legislate against the importation of such ponies early in the season. I think our winters are too severe for the ticks.*"—PROF. A. J. COOK, page 229.

ARMSTRONG wheat (Landreth) is not very popular on Long Island. One farmer, after having raised it three years, goes back to Clawson, though he prefers the Armstrong for its superior quality.

"*Remember that appearance, quality and uniform size are all important passports to profit, and that in this business "honesty is the best policy."*—E. WILLIAMS, page 230.

AS OUR readers well know the R. N.-Y. has from time to time urged the directors of our experiment stations to take up poultry in connection with other live stock. Such a course would do more to gain the interest and attention of the farming public than anything else ever can do. We are very glad to see that the Canadian experiment station managers realize the great importance of poultry experiments. In the last report issued by Prof. Saunders, we find a very interesting account of the poultry department. It appears that a practical poultry breeder is employed at the station to develop crosses between the different breeds, and to establish facts regarding the most profitable breeds for egg production and for table use. We are pleased to see that the R. N.-Y.'s suggestion has led to something definite, though it is a trifle humiliating to think that our own stations cannot start in the matter.

"*It is only the countries of small total area, and of small area under potatoes that at all nearly equal England in yield per acre; and among them Belgium and Holland, the second and third on the entire list, more nearly approach it than any other, in density of population, and in the amount of live stock kept per acre, and consequently in the supply of manure.*"—DR. GILBERT, page 235.

SOME of our wise Yankees find much to amuse them in the disputes English farmers and butchers are having regarding the wisdom of weighing cattle rather than guessing at their weight. It is hard for some of us to understand why English farmers of good standing should still insist that the scales are not necessary in the cattle business. Yet, are all our own houses such that it is safe enough for us to throw stones? How about some of the systems employed in determining the value of the milk sent to butter factories? It is one of the most absurd notions of trade to assume that there should be any uniform price for milk. There is hardly any salable product that shows a wider range of value than milk. Take two samples of milk sent to a creamery. One may be worth, for butter, 50 per cent. more than the other, and this superior value should be recognized and paid for. Are the methods for determining these values fair and just? The RURAL proposes to investigate these methods and to present one which promises to prove exact, easily understood and fair,

A STEAMSHIP recently arrived in this port with 700 tons of bones which were collected on the desert of Sahara. The misfortunes of man and beast on the great desert of North Africa have frequently been recited in song and story. They are now being turned to commercial account. For years these bones have been accumulating in the desert. Caravan after caravan has succumbed to the terrible wind storms. The bones of men and beasts are found all along the desert tracks. These bones are easily collected, for as one wind covers them, another blows away their sandy shroud. Some years ago a German trader in Alexandria conceived the idea of collecting these bones for manufacturing and fertilizing purposes. The trade has increased to immense proportions, and the bones are now being sent to a dozen countries. Many are sold to the sugar refiners, but the greater proportion are made into fertilizers. Urgent indeed are the needs of agriculture in some localities when men will find it profitable to brave the dangers of the great desert in their search for phosphoric acid!

"*It is my firm belief that through intelligent and continued crossing and hybridizing we must look for the most rapid, successful and important improvements in the character and value of our American grapes.*"—GEO. W. CAMPBELL, page 230.

THE New York legislature of 1888 enacted a law, entitled "An Act to Encourage Arboriculture." This provides that the Friday following the first day of May, shall be known hereafter as Arbor Day in this State. The act further states:

"It shall be the duty of the authorities of every public school in this State, to assemble the scholars in their charge on that day in the school building, or elsewhere, as they may deem proper, and to provide for and conduct, under the general supervision of the city superintendent or the school commissioner, or other chief officers having the general oversight of the public schools in each city or district, such exercises as shall tend to encourage the planting, protection and preservation of trees and shrubs, and an acquaintance with the best methods to be adopted to accomplish such results.

"The State Superintendent of Public Instruction shall have power to prescribe from time to time, in writing, a course of exercises and instruction in the subjects hereinbefore mentioned, which shall be adopted and observed by the public school authorities on Arbor Day, and upon receipt of copies of such course, sufficient in number to supply all the schools under their supervision, the school commissioner or city superintendent aforesaid shall promptly provide each of the schools under his or their charge with a copy, and cause it to be adopted and observed."

State Superintendent Draper has issued a circular which explains the law and outlines a partial programme. We hope that all school officials will secure a copy and act upon the suggestions contained in it. New York is slow at starting in this matter, but we hope for good results now that the start has been made.

The publication of a story entitled "Our First Farmers' Institute." will soon begin. We know our friends will like it. It is sharp, bright and suggestive, and, we judge, true in all things.

JAPAN CHESTNUTS.

TWENTY chestnuts of the Japan variety known as Paragon, were sent to us by H. M. Engle, of Pennsylvania, last fall. They were placed in a box of sand moderately moist and the box was kept in the cellar. The nuts, which were found to be perfectly preserved, were planted last week. These nuts, so preserved, sprout very readily and make a growth of about 18 inches the first season. The R. N.-Y. for several years past has advised those of its readers who can afford to experiment to raise Japan chestnut seedlings, and that is still our advice. Possibly the Paragon is an outcome of that advice. We have in this a nut nearly as good as the American chestnuts, and twice as large as the largest of them, while the beautiful trees bear even in the nursery rows. Some of our esteemed contemporaries have discovered that the Japan chestnut is of vile quality, and are, hence, advising their readers not to plant the trees. But the R. N.-Y. begs to offer the opinion that those who, acting upon its advice, shall be able to offer Paragon nuts, or other seedling Japans as good for sale, will find a ready and remunerative market for them. We do not know Mr. Engle and our praise of this variety, as has been our condemnation or praise of all other fruits or plants sent to the Rural Grounds for trial, has been given regardless of the interests of those who have sent them.

HOW IS IT?

TEN years ago, the R. N.-Y. announced, as the result of its own trials, that weevil-eaten peas were essentially worthless for seed. Seedsmen, the best of them; entomologists, the best of them, denied it. The contest was hot. To-day reputable seedsmen will not sell weevil-eaten seeds. How much was this bit of information worth to the country? How much has it been worth since? The RURAL's discovery has never, that the writer can recall, been recognized by the agricultural press. If an experiment station had discovered it, the press would have heralded it far and near—from Dan to Beersheba. We are not carping at this. It is mentioned as an instance of the narrow-minded, mercenary spirit displayed by the farm press in matters which it is their *duty* to make public regardless of their pecuniary interest for the time being. It is on a par with the fact that such farm journals as the American Cultivator, New England Farmer, Massachusetts Ploughman, Country Gentleman, etc., refuse the yearly advertisement of the RURAL NEW-YORKER, setting forth, in conservative terms, its claims to the support of American farmers. It's on a par with their non-recognition of the R. N.-Y. as essentially the first agricultural experiment station in America, and of the effective contributions it has made, as such, towards the advancement of agricultural interests.

The R. N.-Y. has meanwhile been glad enough to record every valuable original investigation made by other journals and sorry enough that they have been infinitesimally few; while it has in no instance refused the advertisement of a contemporary. The R. N.-Y. has never in a single instance, known to it, copied or rewritten an article original with another journal, without giving full credit. In hundreds, if not thousands of instances, we have seen the articles, or parts of them, the methods, the results of investigations made by the R. N.-Y., at no little cost of time and labor, printed in other farm papers without a whisper of credit. It is a short-sighted, selfish policy, brother Editors, and, though it may save you a penny to-day it will lose you two pennies to morrow. As a sort of incidental proof of this, it may be said that, though few if any of the farm papers can justly claim an increase in circulation this year over last, the R. N.-Y.'s circulation is to-day larger than it was in either 1887 or 1888—and this has occurred, too, notwithstanding the fact that we have advertised comparatively little (as compared with previous years) in other journals, with a view to increasing its circulation. It has likewise occurred notwithstanding the fact that its price for single yearly subscriptions is the same to-day as it was 10 years ago, while scores of our contemporaries have reduced their price all the way from two dollars to a single dollar, while fifty and even twenty-five cent monthlies are thicker than new-fledged agricultural professors.

A GIGANTIC SALT TRUST.

SOME time ago a great salt Trust was formed in England which, at the outset, disclaimed any idea of putting up prices. Its professed object was to put down the cost of production by the introduction of better methods and appliances and a more economical management, the chief point in which was to be the dismissal of a large number of employes who would be rendered superfluous on the concentration of many small salt making concerns in a single large one. The business prospered amazingly for the stock-holders from the first. Expenses were greatly cut down by throwing hundreds of clerks, superintendents and workmen out of employment. Then, still further to increase the profits it was found really necessary to decrease production and increase prices. The public grumbled, but what could the public do about it?

Having lowered the cost of salt as far as practicable and raised the price of the article as far as at present tolerable in England, the Trust wished to avail itself of the greatly reduced rates of transportation it could command to the vast market afforded by our population of sixty millions. The import duty on salt, however, is 12 cents per 100 pounds in packages and eight cents per 100 pounds in bulk, or an average of about 70 per cent. on the cost of salt produced in this country. Indeed of late years, salt has been made for as little as 12 cents per 100 pounds in Michigan, and, of course, with cheaper labor, the cost of production is still lower across the water. If therefore, the English Trust could induce American producers to put up the price of the salt to the extent of the duty, importations of English salt would be enormously increased, while the American salt-makers would be amply compensated for the smaller amount of the product sold by the much greater price they obtained for it. Moreover, to gain their object the transatlantic capitalists were willing to invest large sums in forming an American salt Trust which should monopolize the business on this side of the water as the English Trust has of late been doing on the other. For some weeks negotiations for the accomplishment of this end have been in progress, and now it is broadly intimated that they have been successfully completed, so that soon a vast salt-producing Trust is pretty certain to take its place alongside of other unscrupulous monopolies of the same oppressive stripe on the already heavily loaded back of the American citizen. This will enable English capitalists to limit production and raise prices in this country, thus throwing hundreds of our people out of employment, while availing themselves of the greater profits to be reaped from the "pauper labor of Europe."

Of course, some of the American salt men deny that the Trust is an English enterprise, and some even allege that there is no Trust, while others try to disguise it as a rather benevolent undertaking. Farmers will be greater sufferers than any other class from the operations of such a monopoly, for they have to use salt not only for their own consumption, like the rest of the community, but also for pickling meat and making butter for sale, as well as feeding stock and even stimulating or protecting their crops. Even strong protectionists intimate that such an attempt to defeat the tariff by combinations of producers who are benefited by it, should be defeated without compromise or mercy. They say that the people have not upheld the principles of protection for the purpose of giving great fortunes to a few favored individuals at the expense of the rest of the community. What do YOU say?

"*Test every cow faithfully; study her as an individual; try if some special modification of feed, or feeding, may not develop merit in her; 'give her a fair show,' and then if there be no good found in her, let her go.*"—BUCEPHALUS BROWN, page 237.

BREVITIES.

AGAIN, Domestic Economy has the floor.

MUSHROOMS retail at 90 cents per pound.

THE Belgian breed is the latest canditate for draft horse honors at the West.

THE markets are flooded with onions. There never was such a supply before.

EGGS are very cheap as compared with last year. A year ago, however, the blizzard had upset all the plans of the hens

BE kind enough to remind your road-master of the fact that wild cherry trees form a breeding place for the tent caterpillar.

THE markets are full of turnips just now. There is but little demand for this vegetable. Boarding-houses and cheap restaurants provide the market for most of those that are sold.

THIS is from a Michigan subscriber:—"I do not like the way you handle the woman question. You make the ladies hard to catch and of no use when caught by training them to be independent of the men."

THE member of the R. N.-Y. family that shows the most appreciative taste for milk is a little Canadian mare. By the way, is there any breed of horses that can perform more work per pound of live weight than these tough little animals?

MARKET-men are fond of saying that there is no fruit or vegetable that cannot be found any day in the year at the New York markets. The desired article can be found if the purchaser has a purse long enough to stand the price. It is generally agreed that of all fruits the pear is the hardest to obtain out of season.

QUITE a business in turkey feathers is done in this city. They are in good demand in the manufacture of feather dusters of which immense numbers are sold each year. There is also quite a trade yet in the old-fashioned quill pen. White feathers are worth considerably more than colored, and breeders of white fowls frequently use this argument in speaking of their favorites.

Rural Topics.

BUCEPHALUS BROWN'S NOTIONS AND IDEAS.

POTATO TOPS.—Generally, in digging potatoes, the "vines" are thrown together in heaps or left scattered over the ground, where they are in the way of cultivation. When potatoes are ripe, the dry tops seem to be a small item, but they contain a full half of the fertilizing salts extracted from the soil. My practice for years has been to bury them in digging. If the digging is not done by hand, then I would have them left on the ground, (not in piles) and work them at once into the soil with a Disk or Cutaway harrow. I suspect that this method of mine, which I have followed for many years, is the reason why I have not been able to see that potatoes are a particularly exhaustive crop. Other crops following them have not indicated any such fact.

"WEARING OUT" SEED.—At a recent farmers' meeting, a prominent agricultural writer is reported as saying that a certain county has "worn out the Hebron," and adds: "We know it to be a fact, but are unable to tell why." Now it seems very strange that a whole county, of 800 square miles, should "wear out" a potato which is as good as ever elsewhere. Do all the farmers in that county pursue a single method of culture, and that one so very injurious? It is utter nonsense to talk about "wearing out" a variety of any cultivated crop—that is, if it is said with the idea that the fault is in the variety. Intelligent and careful cultivation, and the proper selection of seed, will keep up and even improve any variety, except in peculiar locations unsuited to its growth.

IMPROVEMENT BY SELECTION.—A good many farmers claim to have tried the plan advised by some experiment stations, of selecting seed potatoes from the most prolific hills, and have reported "no good." This is just what I expected to hear. The advice was too unqualified; and even with qualification, it is only true under limitation. Bucephalus has bent his back, digging "taters," lo! these many years; and he can indorse the professional statement that some hills, and some individual plants, will turn out handsomer potatoes, and many more of them, than others. What makes them do it? Sometimes it is a mysterious modification in the plant itself. If this be the case, seed selected from that plant may be more productive,—and it may not,—for few things are less certain than that the peculiarities of "sports" will be perpetuated in their posterity. But in most cases these fine productive plants are so just and only because "their lines have fallen to them in pleasant places," that is, in rich spots. When this is so, seed from them is no better than from another hill, in poorer ground, that is not half so productive.

MIND THE CONDITIONS.—Experimenting professors at the stations, where everything is supposed to be done well and systematically, will often get results that will not be justified in the experience of common farmers, because the conditions are in nowise the same. For every crop at the station the land will be thoroughly prepared and suitably fertilized, according to the teachings of enlightened experience. Upon how many farms will the like conditions be met with? And if they are not found there, how shall the results agree?

KILLING OFF THE POOR COWS.—Some of our cautious cultivators, (you see I am falling into alliteration, due probably to the example of the RURAL'S head-line editor,) are wanting to know what they shall do with their feed, if they send all their unyielding cows to the slaughter. "Give it to those you have left," is the only reply I have seen made, and it is a pretty good one. But it cannot be applicable to all herds. I know some farmers that are feeding all they ought to their cows, yet who might weed their herds considerably with profit. I should say to such, that they make no hasty or wholesale slaughter. Test every cow faithfully; study her as an individual; try if some special modification of feed, or feeding, may not develop merit in her; "give her a fair show," and then, if there be no good found in her, let her go. If this plan is followed there will be no sudden, wholesale reductions of the herd; and time will be allowed to replace the rejected ones by others that are known to be better. This is what the most of our improving dairymen are doing. There is not going to be any wholesale slaughter, or any indisposable surplus of feed.

SOLUBLE PHOSPHATES.—According to Sir J. B. Lawes, while it seems evident, at least on his heavy soil, that turnips must have their phosphoric acid served to them in its most soluble form, it is also apparent that this is not true of other crops. Sir John recognizes a difference, too, among that class of phosphates so deceivingly classed by chemists as "insoluble," and expresses the belief that the phosphoric acid in basic slag, although not soluble in water, is not only available for grain and grass crops, but is also available for roots. He adds that, while turnips do not seem capable of extracting the slowly soluble phosphates from the soil, the mangels find no difficulty whatever in doing so. Making the phosphates "soluble" doubles their cost; and it is high time that our instructors, the agricultural press, should take hold of this subject in earnest and discuss it exhaustively until its readers are taught all the facts about it.

A QUACK IDEA.—Under this heading may be justly placed the proposition to regard the soil as practically inert, and unable to supply any nutriment to crops. This is disguised under the plausible formula, "feed the crop, and not the soil," the practical outcome of which must be that the whole demand of all crops for soil nutriment should be supplied to them in manures and fertilizers. This is utterly preposterous. There is plant food enough in every available soil to nourish vegetation indefinitely. It is only when we want to push the soil to produce extra crops that any artificial feeding of the plant is required. The major part of the food of all plant growths must be supplied by the soil. It always has been and it is safe to say it always will be.

Domestic Economy

CONDUCTED BY MRS. AGNES E. M. CARMAN.

Starching, Ironing, Etc.

HOW BEST TO DO IT.

ELBOW GREASE, CLEANLINESS, DEFTNESS, DIFFERENT KINDS OF STARCH, SUBSTITUTES, CONCOMITANTS.

Boiled, Celluloid, Elastic, Electric, Satin Gloss, Silver Gloss and Water Starches. Borax, Butter, Gum-arabic, Kerosene, Lard, Milk, Red Cedar, Salt, Spermaceti, Sugar, Tallow, Turpentine and Wax Prevent Stickiness.

FROM MAY MAPLE.

Ironing day is often the greatest dread of the whole week's work, on account of the "starched clothes," and many a young housekeeper spends the day in tears while she stands at the ironing-table trying so hard to make those shirt-bosoms look as they used to when "his mother" had charge of his clothes; for, in spite of all her efforts, there will be a blister here, an ugly wrinkle there, a streak of smut from the flat-iron or, mayhap, a scorch, and in despair she tosses the detestable article to one side, only to return to it with renewed vigor after ironing some other article requiring less patience and care; but the once fastidious John is obliged to wear a very sorry specimen of laundry work. To the experienced hand there is no work about the house that is made more proudly prominent than the ironed finery of the family, as it is hung upon the clothes-horse in immaculate purity, and most conspicuous of all are the fine shirts with bosoms, cuffs and collars as white as freshly-fallen snow, as smooth as French china, and as stiff as a board.

Of course, there is a right way and a wrong way to do laundry work as well as any other, as Leona found to her sorrow, and also to her joy. When she went out from the farm to service in town, her mistress told her she could put the shirts with the soiled clothes after she had spent nearly the whole of a hot July afternoon in "doing up" three fine shirts.

The next week, when she was doing the washing, the mistress came to the kitchen and made the starch. Putting a good spoonful into a bright tin basin, she moistened it with cold water, and then poured about a quart of boiling water upon it, and then put it on the stove to boil for five minutes, stirring it frequently. It was then taken off to cool, and was then ready for use, and was what is usually called thin starch.

"Now, Leona," said Mrs. H., "after you have rinsed the clothes, dip the fine pieces in this starch, taking collars and cuffs, shirt-bosoms and bands first, and when they are dry, make some fresh starch like this and dip the last mentioned articles into it; wring and hang up to dry, and then dip, and wring out of this last starch again and dry; that is, three dips in the thin boiled starch, drying after each dip. When you are sprinkling the clothes in the morning, make a little thin cold starch and dip the shirt-fronts, neck-bands, collars and cuffs in it, wring and shake out, then fold and roll tight and let them be for two or three hours, then iron with a moderately hot flat, and I think you and I will both be better satisfied with the laundry work."

"My next ironing day was one of the happiest of happy days," said Leona, in relating her experience, "for my fine clothes looked just beautiful, and the work was so easily and quickly done. That starching lesson will last me all my life, but, oh! how I cried over that first day's work. I shall never forget how my feet ached and how every nerve throbbed with impatience and disgust at housework, and fine ironing in particular."

I like to do the starching immediately after rinsing. I make a thick boiled starch, adding a tea spoonful of white sugar and a tablespoonful of kerosene oil. Rub the starch into the fabric thoroughly, and hang up to dry with the washing. Starch again in cold starch, roll up tightly and leave the clothes well packed for two or three hours. In ironing, the sleeves are straightened out and ironed, then the wrist-bands are smoothed out on the wrong side till about half dry, and then turned to the right side for the finishing strokes. Then the body of the shirt is ironed, and next the yoke and band, which received their full share of starch—for a well-starched band adds much to the fit of the collar. The bosom board—which, by the way, is only a piece sawed from an eight-inch pine board and wrapped about with a piece of an old pillow slip—is a great convenience though inexpensive, and next comes into use. The ends of the neck-band are buttoned together, the board is slipped under the bosom, which is straightened out from top to bottom, a clean white cloth is wrung out of clean water, and spread over the bosom and ironed with a hot flat. While the cloth is yet steaming, take it off, and with a clean iron work up and down on the fabric as much as possible, remove all specks with a damp cloth, and iron again till a delicate gloss appears. Collars and cuffs are usually smoothed out on the wrong side first, and then ironed on the right side, but never reversed, for to do so takes off the gloss. In this way a fine shirt is no more to be dreaded than a pillow sham or white apron.

FROM EMMA D. W.

I find it rather difficult to put into words my way of doing up linen. Experience has so much to do with it, to get the starch just right, and to know when an iron is at the heat which will do the best work. I use about one table-spoonful of lump starch, and a tea-spoonful of kerosene for each pint of starch needed. Dissolve the starch in cold water, add the kerosene, then slowly stir in boiling (be sure it is boiling) water till it is a clear, rather thin jelly—it is now ready to use. Use it as hot as you can. Dip the shirt bosom in wrong side out, squeeze out, then rub it in well; if too wet squeeze out again. Proceed in the same manner with the wrist bands, collars and cuffs and dry them. Be sure they are perfectly dry before wetting them to iron. I wet them in cold raw starch, using a good tea-spoonful to a pint of water. Mix well, and stir before dipping each piece in. After dipping in squeeze out and roll up tightly. Let them remain so about two hours before ironing. Bring to this work good, clean, smooth irons, at the right heat, strength of arm and patience. Rubbing a bit of beeswax tied in a cloth, over the irons if the irons are then well rubbed on a clean cloth, helps to make them smooth. Iron the bosom of a shirt last, and use a board to iron it on. Stretch and straighten it well, then iron. If it blisters it is because the starch is not well rubbed in. Try wetting it with raw starch, then iron carefully until it is dry, using much strength. Don't call a shirt done when any part of the bosom sticks to the board, and after it is well ironed see that it is well aired near the fire. Pull the collars and cuffs straight, and smooth lightly with a dry cloth, then pass the iron quickly over them, but do not press at all, straighten again; now use all your strength and iron dry on both sides; then polish the right side and, lastly, shape them so they will not break. I do this by pressing the flat lightly on the wrong side and drawing the collar or cuff through with the left hand, raising it as I draw it. I repeat this several times, then put the articles in something which will keep them rounded, and keep them in as hot a place as I can without scorching, till they are *baked* in shape.

FROM MRS. F. L. AVERY.

My clothes are all dried before starching. I use nothing but *Wheat* starch, and when I called for it here two years ago, my grocer had never heard of it, but found no trouble in getting it for me. I use two heaping tablespoonfuls of starch, dissolve with a little cold water, and pour on one pint of boiling water, stirring rapidly. To boil 15 minutes or longer won't hurt the starch, if you are careful that no lumps are formed. When cool enough to handle, rub into the bosoms and collars, from the outside, all the cloth will take, and do this very thoroughly too. Rub out all wrinkles with the hands before hanging up to dry, as this helps in ironing. In the morning, or two hours before wishing to iron, dip the clothes into cold starch made with two-thirds of a pint of water and one heaping tea spoonful of starch. Sprinkle and roll up. Lay collars and cuffs on a towel and also roll them up. Partly iron the bosom with a cloth over it to absorb the water, and the iron will not stick. Carefully remove the cloth (so as not to make blisters) and iron thoroughly dry. Placing the shirts before the open door of the oven will cause them to be "as stiff as a board." Collars may be stiffened by placing them on a board in the oven for a few minutes with the door left open. A marble slab the size of the bosom-board, or one made of fine-grained hard wood polished, is necessary for putting on the "Heathen Chinee" polish. Get an iron with sides and ends rounded and very smooth—a polishing iron. Place the board under the bosom, wring a piece of soft cloth out of water, just as dry as you can, rub this once or twice up and down a narrow strip of the bosom, as only a slight moisture is needed. Polish by rubbing with the round point of the iron, *up and down—never across*—the goods. Moisten only a small place, then polish. One not accustomed to doing this requires practice. It cannot be done perfectly till after several trials. I learned this from a colored "auntie," and, if I remember rightly, it was only after a good many trials that the work suited me.

FROM MRS. E. C. GILLETT.

On washing day, when the linen is ready for the line, take a dish that can be set on the stove—a bright tin basin or an agate dish or kettle—in it put one table-spoonful of starch, one-quarter of a table-spoonful of lard, also a tiny pinch of salt if you wish to be perfectly sure the starch will not stick. Add as little cold water as will thoroughly dissolve the starch, pour on boiling water—hard is better—stirring constantly, and let this boil. One quart of water will generally make it of the right consistency, as it is better to have the hot starch too thin than too thick. Now add a touch of bluing and put the collars and cuffs in one side of the dish. Dip the shirt-bosoms and wrist-bands in the starch and rub them while they are as hot as you can possibly endure them—a dish of cold water to dip the hands in when too hot will help—squeeze out all extra starch when they have been well rubbed. Rubbing vigorously while the articles are hot and not using too thick *boiled* starch will prevent blisters. When the articles are well dried, dip them in cold starch made from one teacupful of cold water, one tea spoonful of starch and one-quarter of a tea-spoonful of powdered borax, this last being very necessary to make linen *stiff*. Slap them between the hands a little, fold the sleeves of shirts over the bosoms, lay the dampened collars and cuffs below, roll tight, and let them remain at least an hour before ironing. I like best to dampen them at night and iron them the first thing in the morning before getting tired with other ironing.

In ironing be sure the flats are clean. Wash them, dry quickly, rub with beeswax and wipe well. Iron collars and cuffs first, taking out one at a time and keeping the others rolled up.

For shirts, iron the neck-bands first, being careful not to stretch them, then the bodies and sleeves. Put a bosom-board under each bosom, pull the linen up and down smoothly, wipe off with a clean cloth, any starch on the surface, and unless the flats are just right, lay a soft fine cloth over the bosoms; let the flats be quite hot, but not hot enough to scorch or cool enough to stick. If they are too hot, one can not iron slowly enough to dry them well. Rub the flat over the cloth once or twice—not more—then press slowly and firmly up and down until partly dry; loosen from the board, dampen by patting—not rubbing unless to remove some speck—with a cloth dipped in the starch and borax

water *unstirred*; then turn the bosom board on the hardest side and polish and dry by rubbing quickly and hard with the flat.

Collars and cuffs should be treated the same way. Iron slowly at first on both sides, lifting the articles often from the board, passing the hot flat over the ironing-sheet so as to dry them slowly on both sides. I have used a polishing iron, but it is hard work and hardly pays for the extra strength. Turn over collars or bend the points before they are entirely dry to avoid blisters. Should any appear during the process, dampen and set a warm iron on them till they are dry again. To shape cuffs, run the flat over them on the wrong side with the right hand, and bend the cuff with the left toward the flat as it passes sideways over. Lay them in the sun, or on clean tin on the warming shelf to dry. I prefer Duryea's Gloss starch for the shine; but I use Niagara as cheaper. Use the boiled starch left for light calicoes, etc., as they will then keep their color better than when flour starch is used.

Crumpled white dresses, dampened while pressing, with borax water, will be fresh and stiff again without washing if not too soiled.

FROM MRS. ALICE P. SHEFFER.

For starching shirts, collars, etc., I use a starch made as follows: (I prefer Kingsford's Silver Gloss starch to any I've used). Wet up the starch with just enough warm water to dissolve it thoroughly; have boiling water ready and when pouring it on the starch, raise the kettle so that the stream falls from a hight of two feet from the pan, pouring steadily and not too rapidly. Have an assistant to stir constantly and evenly. When it is of proper consistency allow it to cook until clear. While starching have the starch as hot as can be borne. People with weak wrists find it very difficult to wring the starched garments properly. To obviate the trouble I often use the clothes-wringer for this purpose. Don't have the wringer too tight. Thoroughly beat the garments between the hands before drying. Everything used about the starching must be scrupulously clean to secure the best results. After drying, wet up a small amount of starch with warm borax water, or rather warm water, adding a portion of borax water to the solution—say a tablespoonful of borax water for a shirt or six collars. Wring out the articles, old and roll up *tightly*. Let stand for two ours, then iron with moderately hot irons. A set of Mrs. Pott's sad-irons do the best work). Iron the shirt-band first, then draw the shirt over a board made expressly for the purpose, that will stretch the bosom evenly and hold it securely in place. After the shirt is ironed dry, draw it over a *bare*, smooth board and finish with the polisher.

In ironing collars, cuffs, etc., pull them gently with the hands until smooth. Iron first on the wrong side until partially dry, then turn and finish upon the right side. Do not turn over again as the tendency is to break up the adhesion of the sections. You can use the polisher the same as for the shirts.

The following is a very good starch polish for which a round price is often asked by dealers:—

Mix together, at a gentle heat, one ounce of white wax and two ounces of spermaceti. Add a piece the size of a pea to starch sufficient for a dozen pieces, or, dissolve two ounces of gum-arabic in a pint of hot water, bottle and cork. Add a table-spoonful to each pint of starch. I add no bluing to any starch, as there is no need if the articles have been properly blued in the rinsing process, and bluing does not readily combine with starch.

FROM MRS. O. J. PUTNAM.

The following is mother's way. As she was taught, so was I. We call it cold starching:

Of course, the shirts, etc., are to be washed clean and dried the same as a sheet or any other article.

Take one and a-half even tea-spoonful of Silver-Gloss starch or any other kind. Dissolve the same with one table-spoonful of milk, then put in one and a-half tea-cupful of cold water—this is sufficient for one shirt, one collar and one pair of cuffs. If more is needed increase in like proportion. Then take the above articles, turn or fold them so as to dip them into the starch on the wrong side, wring or squeeze all the extra starch water rom them, then roll them up together and lay them aside. See that the sad-irons are scrupulously clean, as a smeared shirt front is not a thing desired. Wash the irons with warm soap-suds and place on a clean stove to heat. When hot take the starched shirt and iron all but what is starched, then place the bosom-board in place, smooth out the bosom on the same, place over it a piece of worn white cotton cloth, then iron on this cloth with a hot iron, no matter if it scorches "some" as it will not scorch through till it is dry or nearly so; then remove the article from the board, starch again on the wrong side in the same starch after stirring it, put back on the board, smooth out—also wipe over with a damp cloth to remove particles of starch if any. Then take a common hot iron and iron right on the bosom, lightly at first; always iron one way this time as the gloss will be all the brighter for it and iron till dry or nearly so, then place the bosom by the fire to finish, as dampness removes the stiffness. Proceed in the same way with collars and cuffs and I think you will be pleased with the result.

I have found this method the easiest and best, after using cooked starch, etc. The articles are quite stiff and glossy and please those who wear them. Practice makes perfect, and you will soon be able to do up your linen in a short time. Do not imagine your starched articles are going to look as glossy as those done up at a laundry where power is used to gloss them. We must use elbow grease and hard rubbing when they have been starched the last time.

FROM MEDORA CORBETT.

To make starch that will make articles glossy and stiff with one starching only, dissolve in a clean, tin basin, one-third of the usual amount of starch, in just sufficient cold water; add boiling water till the starch is transparent and smooth, let boil for two or three minutes, and when comfortably cool, dissolve, in an earthen dish, the remaining starch and borax (one-half a tea-spoonful to one table-spoonful of starch) with a little cold water, add to the cooked starch a few drops of bluing, if desired; stir well together and strain into the earthen dish through a thin cloth or a fine wire strainer.

Having ironed the plain parts of a shirt, slip the bosom-board in, wrong side up, dip the collars and cuffs in the starch, lay them on the bosom and rub the starch in and the wrinkles out. See that each piece is wet through and through before laying it aside for 30 minutes or more protected from dust and flies.

To iron: lay a cloth over the bosoms, and put the collars and cuffs between two folds of a cloth; iron with a moderately hot iron, but not too long before removing the cloth; make the articles as smooth as possible, and when dry, pass a wet cloth over the right side of the ironed surface and polish. The amount of gloss obtainable will depend upon painstaking and the kind of flat-irons used. Put collars and cuffs in a deep dish and in a hot oven for a safe length of time.

FROM AUNT RACHEL.

After shirts have been washed and wrung out of the rinsing water, they are starched in boiled starch. This is made by dissolving a couple of table-spoonfuls of starch in a little cold water in a pan or basin. Set this on the stove and pour into it boiling water until the contents thicken, stirring all the time Remove from the stove and when cool, starch the bosoms and collars and hang them on the line. A little pulverized borax, dissolved in the starch, helps to stiffen the articles and if a sperm candle is stirred around in the starch while the latter is hot, it will assist the work of the flat-iron. Very particular persons hang their shirts on the line and pin them at the shoulders. When dry and ready to iron, the bosoms, cuffs and collars are wrung out of cold starch; that is, a tea-spoon of starch dissolved in a half-bowl of water. They are then rolled up and laid away for an hour, then ironed until dry, with a hot iron. If a soft white cloth wrung out of cold water is rubbed over the bosom when any spot or wrinkle appears the ironing will be all the better. Collars are treated in the same way, and embroidery is ironed on the wrong side. Starched clothes should not be hung out in very freezing weather, as the starch is apt to stick when the clothes are ironed. Good judgment will vary the mode of handling finely-starched goods according to the state of the weather. As in many other cases, practice in this "makes perfect."

FROM EMMA L. ROBERTS.

For one bosom and collar I moisten a tea-spoonful of starch with cold water, pouring on boiling water until I have the proper quantity. I use a new tin dish, and if the boiling water does not make the starch clear, I place it on the stove, and cook it until it is clear—but no longer. A little gum-arabic water, a small shaving of white beeswax, and two or three drops of kerosene improve it very much—one may use one or all if she has them. The starch should be made to penetrate the cloth by striking the article between the hands and keeping it rolled up tightly for two or three hours. I first place a cloth over the bosom and iron lightly; then remove the cloth and polish the bosom with a reasonably hot iron. If the result does not suit, I moisten the bosom with a cloth dipped in cold water and try again. It will polish all the better for wetting.

FROM MRS. A. J. GREENE.

Just before the articles are ready for the line I make my starch, allowing a table-spoonful to each shirt and its quota of collars. Having put the starch into a large bright basin, add sufficient cold water to dissolve the starch and also a small piece of white wax or spermaceti, pouring over the whole boiling-hot water to make it of the consistency of thick cream. Place shirt-fronts, collars and wrist-bands in the starch while it is quite warm; wring out and *thoroughly* rub the starch into the articles and hang them upon the line to dry.

An hour or so before ironing I put them, just long enough to wet them, into *warm* water in which has been dissolved about a tea-spoonful of starch to each shirt, wring them out, and roll the collars in a towel and the shirts by themselves.

When ready to iron I stretch the articles on the ironing-board and thoroughly wet each with a damp cloth, then pass quickly over them a good hot iron, polishing them until dry.

FROM MRS. H. T.

Take two table-spoonfuls of good Gloss starch and mix smooth with three table-spoonfuls of cold water. Set the pan on the stove and pour over it slowly, stirring all the time, one quart of boiling water. Let it boil five minutes. The starch must be strained through a thin bag into a pan. No matter how free from lumps the starch looks, the straining should not be omitted. When the shirts and collars are ready for the line, dip them in the not starch and rub it thoroughly into them from the wrong sides of bosoms and collars. When they are pertectly dry mix smooth one tea-spoonful of starch in one pint of cold water, dip the shirt bosoms and collars into it, wring out—not very dry—roll up and let them lie 10 minutes. Iron the plain parts first; rub the bosoms with a clean, damp cloth. Iron pertectly dry.

FROM "MARGARET."

The soiled articles should be first put into cold water, and rubbed slightly with the hands to remove the old starch and to loosen the dirt, then they are washed and dried in the usual way. An hour before ironing, I take about two table-spoonfuls of Gloss starch to a pint of water, dissolve it with cold water, adding enough warm to make it a little more than of blood-heat. Add a very little bluing, dip the collars in this and wring out several times—do not wring very dry the last time—then roll in a sheet. The shirt-bosoms are treated in the same way and laid away until ready to be ironed. Now take a soft cloth and rub the articles to remove any starch which may be on the surface; take a hot flat-iron and iron the collar first on the wrong side, then smooth the right side several times; change for a cooler iron and polish by rubbing vigorously.

FROM MARY E. WARREN.

A certain amount of tact and natural deftness of manipulation is necessary to do the simplest things *well*, and this is true for so simple a thing as starching and ironing. My method is this: After rinsing and bluing, I dip the articles in a boiled starch, (taking it for granted that every housekeeper knows how to prepare this) using the best sort. When the articles are dry, at evening I dip them in a cold starch—I find Electric or Celluloid starch very nice for this—roll them tightly, and in the morning iron them with a *hot* iron, but not so hot as to discolor or scorch the linen. By lightly rubbing the iron over with a piece of white wax, and then with a dry cloth before using it, a better polish will be obtained. Finish with a polishing-iron treated in the same manner.

FROM MRS. LINDA T. VAN BUSKIRK.

When I am ready to iron, I set a shallow kettle (the potato kettle) on the stove with some water to boil. Take a tea-spoonful of starch for each shirt, put it in a small bowl, dissolve or wet the starch with as little water as possible, then, while stirring it, add enough boiling water to make enough starch for the articles. Set the bowl in the kettle of boiling water and keep stirring the starch until it is cooked. While cooking put in a lump of nice suet tallow as large as a pea—it prevents all sticking. (I have tried kerosene but don't like it.) Apply the starch to the back of the bosoms, fold from right side and press tightly so that all will be damp. Then spread the article out, pull it into proper shape and hang it up for a few minutes. Iron the other articles and watch the starched ones. When they look as if they were partly dry, begin ironing them. Iron the plain parts first, then put a bosom-board into the shirt under the bosom, have a clean cloth and water handy to dampen dry places and wipe off any foreign substance. I lay a thin cloth over all starched articles first and pass the iron over this. When smooth take off the cloth, and rub a moderately hot iron quickly over. This puts on a polish that "my John" says is good enough for him or any one else. I use "Satin Gloss starch."

FROM MRS. A. H. S.

I am not presumptuous enough to think that my method will be beneficial, except as a contrast to the more modern methods of the present time, yet I will give it. After they have been washed, the clothes to be starched are allowed to become thoroughly dry before they are starched. Starch is then well rubbed into the different pieces, which are again dried *in the sun*. Common irons are used, and with reasonable care the results are satisfactory in my family. In making starch, I use the ordinary lump starch of the stores. This I dissolve in cold water until of the consistency of cream; then pour on boiling water, stirring constantly. It is then boiled for about 30 minutes, a small piece of butter being added. To make the irons smooth I rub them on a spray of red cedar and then they will put a fine gloss upon collars, cuffs and the like.

FROM MRS MARY E. PRESLEY.

After trying various methods of doing up shirts and collars with varying degrees of success, I have finally adopted the following which gives me complete satisfaction, but perhaps it would not be as well thought of by others. After the linen is thoroughly dried, I apply as much thick-boiled starch as it is possible to charge it with, to which is added one-half tea-spoonful of powdered borax to one quart of the starch. Starch is best applied with a brush. Roll the starched linen up and in course of half-an-hour it is ready for ironing. I use ordinary flat irons, and if one is careful there is never any trouble with the starch sticking to them. The secret of success in getting the brilliant polish so much sought after is "elbow grease." If a very bright gloss or enamel is desired, after ironing in the usual way an iron for this particular purpose must be used, which is a very heavy iron, rounded at the bottom and very bright. But as I have said I never fail to succeed with the ordinary ones.

FROM LIZZIE JOHNSON.

I do not starch the linen until it is dry. I then take about one tea-spoonful of Niagara Gloss starch to one shirt bosom, and proportionately for the collars, and dissolve it in the amount of water needed. I then starch the clothes and let them remain for a few minutes before ironing. I have used one tea-spoonful of a solution of gum-arabic and water in the starch with success.

FROM MRS. A. J. BRACE.

In my opinion it is not so much the method of starching upon which success depends as upon the starch itself. I always experienced more or less trouble until I began the use of Elastic starch and since then I am satisfied with my work even when done with the ordinary flat-iron, though I doubt not the so-called diamond-faced laundry irons would give a much finer polish

FROM MRS. GEORGE RANDALL.

When the clothes are ready for the line, I rub the bosoms of shirts as well as the collars with warm starch of the consistency of sweet cream. Three hours before ironing, dip them in cold starch and roll in a dry cloth. When ready to iron, I then rub them well with a damp cloth to remove any superfluous starch. I use a hard bosom-board covered with fine cloth. After smoothing nicely, rub hard and quickly. I do not polish.

FROM E. B.

I take the following ingredients in this pro-

When she was a Child, she cried for Castoria.
When she became Miss, she clung to Castoria.
When she had Children, she gave them Castoria.

portion: one table-spoonful of starch, one-half tea-spoonful of turpentine, and the same of salt. Moisten with a little cold water and then pour on about a half pint of water as hot as one can bear the hands in. After starching the articles, roll them up and leave them about ten minutes, then iron. I meet with very good success.

FROM N. J. PEFFER.

I wash, then starch the articles in cooked starch quite hot—then dry and starch again in thin, cold starch (unboiled) and iron with a common iron.

ARE YOU GOING WEST?

If you are going west of Montana, you should by all means go by the St. Paul, Minneapolis & Manitoba Railway, the only line offering a choice of three routes to the Pacific coast. You will pass by day-light for 300 miles through the Great Reservation of free government land in the Milk River Valley, and through Butte, the largest mining camp on earth, en route to the coast. Do not fail to see this government land as you go west. For further information, apply to F. I. Whitney, G. P. & T. A., St. P., M & M Ry., St Paul, Minn.—*Adv.*

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

CHAT BY THE WAY.

A CORRESPONDENT in Iowa asks us how to propagate Tea roses. There are four methods of propagation among florists—by cuttings or slips, budding, grafting, and layering. The first method our inquirer will find most practicable. Most florists do their rose propagation during January, February and March. The slips are made to one eye, the wood being sloped diagonally at the bottom; they are then stuck in pots or beds of sand. In a greenhouse there are heating pipes running under the benches, and this bottom heat causes the cuttings to root rapidly. If our correspondent does not possess these facilities, she will do well to put the cuttings in a window, where they will have no direct sun. The sand must be kept quite moist. The cuttings should take root four or five weeks after insertion, and should then be potted in pots not more than two and a-half inches in diameter. Rose cuttings may be made all through the autumn and winter; but the largest percentage seem to root during the three first months of the year. Tea roses propagate, as a rule, more readily than any other variety.

The same inquirer asks how to manage the tender cannas in the spring. We presume the tubers have been stored away all winter and kept from the frost like potatoes. Nothing need be done with them until the latter part of May, or the beginning of June, when they are to be planted out in well enriched soil.

* * *

AMONG the old fashions revived is that of cross-stitch embroidery. Many of the mothers and grandmothers will recollect the days when, instead of the ready indelible ink, every garment was neatly marked in cross-stitch. Four threads each way was the usual rule, and many a beginner has shed angry tears over those troublesome stitches. Now some of the prettiest table scarves, doileys and lunch cloths are worked in this stitch, imitating the fashionable Russian embroidery. Geometrical patterns are chosen, usually worked in blue, red, or yellow cotton. A charming lunch cloth is of fine white linen, with a geometrical border in red and blue cross-stitch; the edge is finished with handsome antique lace. One can find ideas in most old-fashioned samplers.

* * *

SOME of the prettiest little photograph frames now seen are imitations of old miniature cases or frames. They are the sizes to accommodate *carte de visites* or smaller medallions, and consist of Rhinestone brilliants set in silver, in antique designs. Others less delicate-looking are of gilt set with turquoise and garnets. Other pretty screen frames to accommodate several pictures are covered with Pompadour chintz.

* * *

PRETTY little trinkets recently noted were Shakespeare bracelets. They were narrow, flat, silver bangles, bearing, in raised letters, some little compliment or bit of wisdom from the great dramatist. These slender silver bangles are still very fashionable; they have entirely supplanted the thick, heavy bracelets of former years. Very pretty silver hair-pins are seen, but for general wear they are not in such good taste as plain shell pins, while the heavy metal is often considered injurious to the hair.

* * *

A GOOD deal of latitude is now allowed in dressing the hair, so every woman may select the style most becoming to her; the simpler it is, the better. The exaggerated "Psyche knot" is past its high-water mark of popularity and is now much modified. A braided or twisted knot, (braided preferable) is worn quite high up at the back of the head; this is becoming to most young women, and is convenient with the leading styles in hats. The bang is a little rounded, shorter at the sides than in the middle, and slightly curled; a tremendously fluffy or frizzy bang is considered rather vulgar. Another really fashionable style, which obtained some years ago, is the catagon plait, a single braid twisted into one loop at the back, coming down over the nape of the neck. The hair must be very thick to arrange well in this mode.

* * *

GREEN still seems a favorite color in everything; it is the prevailing tint in new millinery. A large hat recently seen was covered with grass-green tulle sbirred on the brim, and puffed over the crown The brim turned up at one side, towards the back; a large bow of shaded green ribbon was at the back. At one side of the crown, and trailing around the brim, was a large and straggling bunch of field flowers—buttercups, daisies, and clover, mingled with grass. Another arrangement in green was a small toque of puffed green tulle, with a loose bunch of dark purple lilac straying all over the crown. A large black lace hat had the brim bordered with moss-green plush, while it was trimmed with quantities of mignonette and grasses.

"THE KING'S DAUGHTERS."

MRS. ELLA M. FALCONER of Riverside, Berrien Co., Mich., writes to "Palmetto:"—"I have been reading some old RURALS lent me by a neighbor. 'The King's Daughters,' interested me very much. I would like to correspond with, and send reading to some of those spoken of. I do not know but that I am too late for names, it has been so long since what I read was written; but I hope not. I am a minister's wife, 22 years of age, and have two children. We live on the shore of grand, old lake Michigan."

I regret to say to this kind lady who has proven herself a "King's Daughter" indeed, that the only address I have by me is that of Mrs. J. C. Stribling, Pendleton, S. C., who, I am sure would enjoy a letter from one like my correspondent, and I feel certain also that she will see that all reading sent to her, is placed where it will do the most good. Being in that transition state known as "moving," I cannot at present lay my hands on my file of the RURAL, but in some paper between July 1st and October 1st, 1888, Mrs. Falconer will find other addresses where reading might be sent with profit.

My heart is warmed and touched by this dear lady's personal expressions of good-will and affection, and I return them most heartily. I would that in a very busy life I could find time to reply to all the dear friends who have greeted me through that common bond, "The RURAL NEW-YORKER." PALMETTO.

LETTER FROM AN INVALID.

AN article read years ago on "The Law of Limitation," has remained indelibly in my memory. My whole life had been a defiance of that law. I was determined to learn all that I did not know, to do all that needed doing, besides being everybody's willing substitute and servant, and my present condition is the legitimate outcome of such folly. I see it now. But as I grow older I am dismayed to find that many others have set that iron law of limitation at naught, and, like myself, are terribly punished.

All that remains for us to do is to submit; to ascertain, as promptly and as correctly as possible, the exact size of the niche we are individually capable of filling, and then, alone with Him who knows by experience the extent of human limitation, to say good bye to all the impossible things we had planned and desired to do.

There is no "bitterness of death" left untasted for one who has done this conscientiously I think; and the "afterwards" is a foretaste of Resurrection blessedness too. No more anxiety, no more dissappointment in ourselves; no more reproachful reflections to the effect that if we had but done differently, we might have accomplished more. We drop from the ranks to-day, are forgotten to-morrow, and the world's work goes bravely on without the individual help to which we attached so much importance while it was ours to give; therefore let us take time for rest, leisure for thought, strength to be glad and grateful: to be sweet, patient, hopeful, cheerful. Let us do this *to-day*, at any rate. To day is ours.

E. S. L.

News of the Week.

AGRICULTURAL NEWS.

SATURDAY, March 30, 1889.

THE President has just issued an order throwing open a part of the proposed Oklahoma Territory to homestead settlement—to go into effect on April 22. The extent of the area affected by the proclamation is rather doubtful, the estimates varying from 1,800 000 to 8,000,000 acres. The first was telegraphed from Washington yesterday morning as coming from the Department of the Interior. The general opinion is, however, that it amounts to about 4,000,000 acres which have been ceded by the Creek and Seminole tribes. There are also about 6,000,000 acres in the Cherokee Strip or Outlet, and 11,000,000 acres more held by various tribes whose title would have been extinguished by the bill creating the new Territory of Oklahoma, which failed to pass the last Congress. It is estimated that about 50,000 persons are ready to occupy the "opened" land. Thousands have gathered along the Kansas, Arkansas and Texas borders as well as in different parts of the Indian Territory ready to rush in as soon as the country should be opened. Hundreds of these have already swept in from all sides, and large numbers were already there before the issue of the expected proclamation. Telegrams from different points in the territory and adjacent country tell us that all the most eligible locations have already been taken up. Some have had their "claims" staked out for years, and a good deal of fighting and several deaths are already reported arising from disputes about possession. The President warns all that anybody taking up land before April 22, will never be allowed to make an entry in the territory, and General Schofield has ordered the troops to make a list of those who offend in this way, but still claims are being marked out on all sides. The troops at Fort Reno in the country are getting ready to enforce order after the land has been legally opened.... .....New Mexico and Colorado having passed laws providing that all meat sold within their borders must first have been inspected alive, thus prohibiting the importation of beef dressed in other places, the Solicitor-General of New Mexico has just ruled that dressed meat from outside sections cannot be stopped and turned back on the border of the Territory. A bill providing for a similar object is now causing some pretty violent discussion before the New York legislature. The dressed-meat interests are very active and pretty persuasive before all the legislatures in which similar laws have been introduced.....The largest creamery in the State has recently been established at Claremont, N. H., and the neighboring farmers have pledged the produce from 1,000 cows to support it...A law to prevent the adulteration of wheat flour has just been signed by the Governor of Maine.. .....The New England Milk-producers' Union has decided upon the price of 32 cents per 8½-quart can for milk delivered in Boston from April first to October first. If contractors refuse to agree to these terms, no milk will be delivered after March 31st. The net average price to the farmer after deducting freight to Boston, etc., would be only 2½ cents per quart.....Various local Milk-producers' Associations in New York State are joining 'The Union of Milk-producers for the Supply of the New York Market." The Milk Exchange of this city composed of local milk dealers, are strongly opposed to the Milk-producers' Union, and claim that internal disorder will soon disrupt it; but there are few signs of such a mishap. .....The earnest efforts of the "oleo" men have failed to secure the repeal of the anti-oleo legislation in Pennsylvania.... It is estimated that at least 100,000,000 pounds of binder-twine will be needed for the harvest of 1889, and that the recent increase in price by the binder-twine Trust or syndicate would give the manufacturers from $7,000,000 to $12,000,000 more than their usual profits—all of which must, of course, come out of the pockets of our farmers. It's certain that much grain in the West will be harvested unbound or bound by hand, and self-binders will be extensively converted into headers. The culture of jute and hemp in this country is likely to be stimulated by the extortion of the Trust, as both make binding twine as good, according to several who have used it, as that made from sisal and manila which cannot be grown here..... .....Last year's bagging Trust, is to be revived once more by the same parties, with headquarters at St. Souis. This is likely to be the last opportunity for doing so, as it is probable factories will soon be established for making a satisfactory substitute at a lower price from pine needles and other domestic products ..... A considerable number of representatives of manufacturers of and dealers in agricultural implements in different sections of the country met in convention at St. Louis, last Thursday. The objects of the meeting are to determine a schedule of rates and prevent disastrous cutting, and also to devise plans to extend trade into the Southern and Southwestern States, where farm machinery is now but little used....The March statistical report of the Department of Agriculture, issued Thursday, gives the result of the investigation, through its correspondents and agents and the merchant millers and the records of commercial inspection, of the average weight of wheat by States. The general average is 56.5 pounds, the lowest average of six years. In the spring-wheat region the range is from 53.5 in Dakota to 55 pounds in Nebraska. It makes the crop equivalent to 391,000,000 bushels of 60 pounds each—less by nearly 25,600,000 bushels than the quantity in measured bushels. ...The Chicago "Big Four" who buy half the cattle that arrive in Kansas City, and two-thirds of those that reach Chicago—the two greatest cattle markets in the country—say that they will boycott cattle from all the States or Territories that may pass laws hostile to their dressed-meat trade. New Mexico and Colorado, which have already passed such laws, are now under ban; the monopoly won't buy a head from either place. ... The members of the State Legislatures, that met the other day in St. Louis to devise some means of counteracting the evil effects of the "Big Four's" monopoly, accomplished little, and the meeting was very discordant. A bill, however, was adopted by a good majority, looking to the suppression of Trusts, and a bill providing for the inspection of meat in each State at the place of slaughter and prohibiting the importation of dressed meat from other States, was adopted by a slender majority. These bills are to be recommended to the legislatures of the States represented at the meeting. An "inspection bill," called the "Cantor bill," is now before the New York legislature, but it will hardly pass unless the farmers of the State speak out emphatically in its favor..... Henry W. Raymond, editor and proprietor of the Germantown Telegraph, and son of Henry J. Raymond, founder of the New York Times, has been appointed Private Secretary to his long-time friend, Secretary of the Navy Tracy.....The strong recommendation of Governor Beaver to the Pennsylvania legislature urging the adoption of much needed changes in the road laws of the State, is pretty certain to be unheeded, and several of the papers are justly indignant .....The present duty on hops is eight cents per pound; but 16,000,000 pounds were imported last year. Little wonder that there is a movement on foot for an increase of duty for the adequate protection of American hop-growers. ..... That great American Meat Company will soon offer for investment $4,000,000 of stock the par value of which is put at $100 per share, though the shares will be offered at $75 apiece; $7,000,000 of its $15,000,000 capital have already been subscribed and paid for mainly in lands, cattle and other property, and it is proposed to keep the remaining $4,000,000 in the treasury for some time so as not to depress the market..... Owing to fear of failure of the wheat crop from frosted seed and consequent loss of traffic after harvest, the Northern Pacific railroad has arranged with the owners of the numerous elevators along the line to furnish good seed to the farmers who cannot afford to pay cash for it, throughout the "frosted section"—nearly the whole territory north of the Northern Pacific, in Minnesota and Dakota. In return, the farmers agree, when the crop is harvested, to pay the price of the wheat and 10 per cent. interest thereon.

Pronounced Correct.

THE Warren Republican, of Williamsport, Warren County, Ind., printed the following in August, 1885:

"Rev. Colbrath Hall, of Pike, was in town yesterday. He reports the wonderful recovery of his wife within the past 18 months, after being *a confirmed invalid for over thirty years* from spinal trouble. About 18 months ago she began the use of Drs. Starkey & Palen's Compound Oxygen Treatment, and she attributes her recovery to the use of that medicine. She is now able to walk, to get in and out of a buggy, to take rides, etc. All acquainted with the Rev. Mr. Hall and his family will rejoice with them in this remarkable recovery."

In a letter, dated September 2, 1885, Mrs. Sara N. Hall, writes from West Lebanon, in the same county, regarding her own case·

"I have read the paragraph referred to in the Warren Republican, and pronounce it correct."

We publish a brochure of 200 pages, regarding the effect of Compound Oxygen on invalids suffering from consumption, asthma, bronchitis, dyspepsia, catarrh, hay fever, headache, debility, rheumatism, neuralgia; all chronic and nervous disorders. It will be sent, free of charge, to any one addressing DRS. STARKEY & PALEN, 1529 Arch St., Philadelphia, Pa., or 331 Montgomery St., San Francisco, Cal.—*Adv.*

LATEST MARKETS.

NEW YORK, Saturday, March 30, 1889.

COTTON is 1-16c higher on all grades, than last week.

POULTRY is in moderate receipt, and prices rule firm for good stock.

HOPS quiet and unchanged.

HAY is in moderate demand, with no change in prices.

BEANS.—The market is active, with slight change in prices

NUTS.—Peanuts are held firmly at former quotations. Hickory nuts and peanuts are unchanged.

VEGETABLE.—The potato market is weak and prices are somewhat lower. Some very nice Bermudas were held at $9. The market is literally swamped with onions and turnips. Very fine red onions are offered for 75c per barrel while they are retailed in Washington Market for 85c per bushel. No sale for turnips. Fresh vegetables from Bermuda and Florida are in good supply, but both quality and prices show a wide range.

FRUITS.—Fresh. Apples are in full supply, and qualities under fancy are slow of sale at low prices. Oranges are plenty and cheap. Cranberries are plenty and lower. Strawberries are dropping in price, ranging from 30 to 50 cents. Evaporated fruits are slow of sale, with slight change in prices.

BUTTER is in full supply, and the demand is limited except for best grades of fresh butter, for which full prices are asked

CHEESE is slow and unchanged.

EGGS are in heavy supply, and prices are lower, fresh gathered nearby being quoted at 11½ cents.

LIVE STOCK MARKETS.

NEW YORK, SATURDAY, March 30, 1889.

BEEVES.—Dressed beef slow, with the bulk of the sales at 5¼@6½c per lb. although strictly prime and choice quality goes as high as 6¾@7c.

MILCH COWS.—Receipts this week to date 127 head. Feeling dull, Inferior to Good Cows may be quoted at $25 to $45 per head.

CALVES.—Market steady, with rather a firm feeling for good stock. Prices ranged from 5c to 8c per lb. Dressed Calves unchanged at 5@10c for Country-Dressed Veals, with little Calves bringing 2½@4c. State and Pennsylvania Calves rarely exceeded 9c. City Dressed sold at 6@11c. Choice at 11½@12c.

SHEEP AND LAMBS.—Sheep sold at $5@$5 60 per 100 lb Yearling Lambs at $6 50@$7, and Spring Lambs were in good demand at $3@$6 50 per head. Dressed Mutton slow but firm at 6½@7½c for Chicago Dressed and 6@8c for City Dressed (Choice bringing 8½c). Dressed Yearling Lambs sold at 9@10½c and Dressed Spring Lambs at $2 50@$6 50 per carcass. Sales of State Sheep, 74 lb average, at $5 per 100 lb; State Lambs, 66 lb, at $6 50; Western Sheep, 99¾ lb at $5 60; Minneapolis Fed Sheep, 129 lb, at $5 37½; Ohio do, 98 lb, at $5 56¼; Michigan Lambs, 66½ lb, at $7; Jersey Spring Lambs, at $4@$6 50 per head.

HOGS.—Market just about steady at $5@$5 50 per 100 lb Country Dressed Hogs easier for Heavy and Medium, but steady for Light Lean Pigs. Quotations are 5@5½c for Heavy, 6@6¾c for Medium; 6¾@7½c for Light States and Lower Jerseys; and 7½@8½c for Light Upper Jerseys.

The Kodak.

PRICE $25.00.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be re-loaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

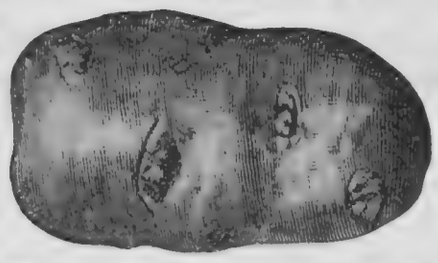
Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker.

The Eastman Dry Plate and Film Co.

ROCHESTER, N. Y.

EARLY DAKOTA VICTOR

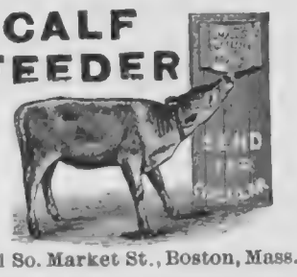
(From a Photograph.)



First Introduction.

Matured from Seed in North Dakota. Earliest Potato in Market. Grown with Early Rose, Vanguard, Downing, and Vick's Gem, getting same cultivation, matured earlier and more than doubled yield of any of them, producing **735** bushels per acre. Skin flesh color; eyes shallow, but strong; flesh pure white and floury. Table quality unsurpassed, baked or boiled. Large and uniform in size and shape; roots extending deep in soil, resisting drought. Big money in 1890 to growers of this potato. By mail, 1 lb., 75c; 3 lbs. $1.50; by express, ½ peck, $2.00. Cash with order, **GEO ELLIOTT & CO.**, Jamestown. Dakota. References: James River Nat. Bank; Lloyds, Bankers.

SMALL'S CALF FEEDER



Supplies a want never before successfully met by invention. The calf sucks its food slowly, in a natural way, thriving as well as when fed on its mother. Now used throughout U. S. Worth many times its cost. S'tisf'ct'n guaranteed or money refunded **J. B. Small & Co.**, 31 So. Market St., Boston, Mass.

WHITMAN'S NEW IMPROVED RAILWAY POWER.

The **BEST IN AMERICA** Has 25 per cent. more power. Far more durable. No breakage. New Governor. Thousands in use. Send for circular. Manufacturers of **Hay Presses, Cider Mills, Feed Mills, Corn Shellers, Feed Cutters, etc.** Address **WHITMAN AGRICULT'L CO. St. Louis, Mo.**

EGGS —P. Rocks, L. Brahmas and W. Leghorns, $1 per 13, 30 for $2. In new baskets, safety guaranteed. Fine stock. Address SAYBROOK VALLEY POULTRY YARDS, Oak Hill, N. Y. **EGGS.**

Strawberry Plants For Sale.

Haverland and Burts, $1.25—100; $8—1,000; Warfield, 75c.—100; $5—1,000; Jessie and Bubach, 75c.—100; $4—1,000; Gandy, $1.50—100; $10—1,000; Hampden. $1 50—100; Summit and Monmouth, $1—100: by freight or ex. **James Lippincott, Jr., Mount Holly, N. J.**

LOOK HERE!—160 acres, Dakota Ter., for sale cheap; 100 under plow; 80 fenced; river cuts round corner; good house, stable, granary, etc.; good assortment of fruit; small grove; good water; 3¼ miles from city of De Smet the county seat. For terms, address **D. C. NOYES, Box 77, De Smet, Dakota Territory.**

"THE Disease proceeds silently amid apparent health." That is what Wm. Roberts, M.D., Physician to the Manchester Infirmary and Lunatic Hospital, Professor of Medicine in Owen's College, says in regard to Bright's Disease. Is it necessary to give any further warning? If not, use Warner's Safe Cure before your kidney malady becomes too far advanced.

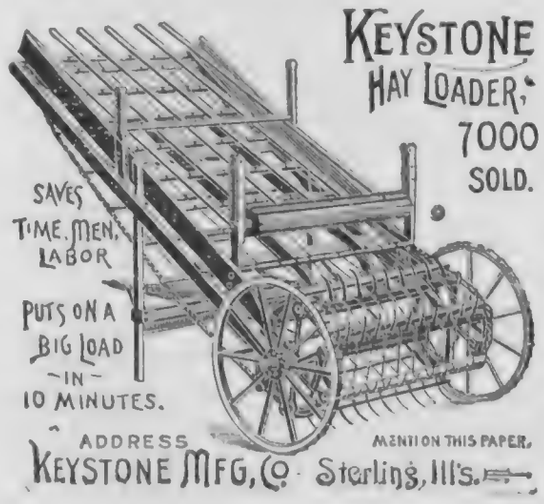
Send for large Illustrated Catalogue.

DR. AUSTIN FLINT, late professor in Bellevue Hospital Medical College, Fellow of New York Academy of Medicine, member of the State medical societies of New York, Virginia, Rhode Island, Massachusetts, etc., says, in speaking of Bright's Disease or advanced kidney disease: "The minor effects are headache, loss of vision, impaired hearing, involuntary muscular twitching, cramps, drowsiness, vomiting and diarrhœa." These are but some of the common symptons of this malady, which accounts for Warner's Safe Cure curing so many diseases (so-called), which are not diseases but are symptoms of advanced kidney disorders.



Newtown Double Geared, Level Tread Horse Powers.
AND THRESHERS AND CLEANERS ARE THE BEST.

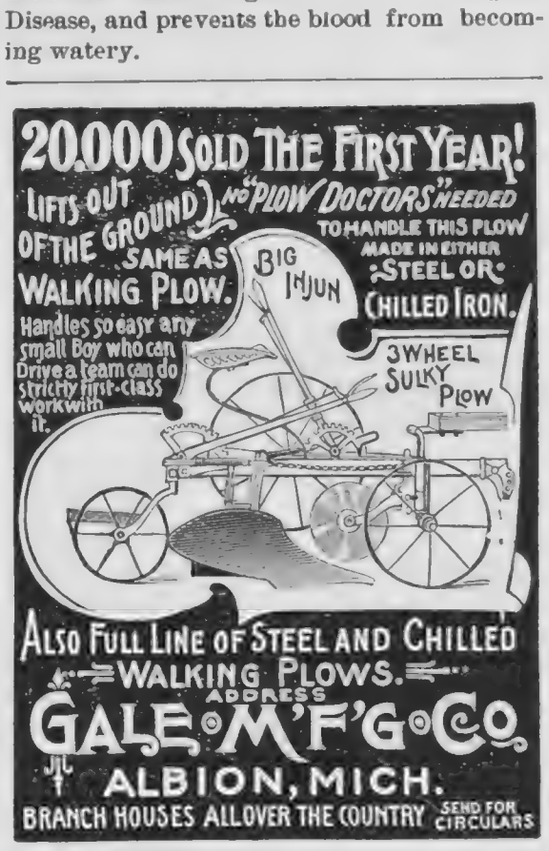
---

FITS, convulsions, dizziness and headache are prevented and cured by using Warner's Safe Cure. Why? Dr. Owen Rees says: "The tenuity (watery condition), of the blood in Bright's Disease, produces cerebral symptoms, the serous (watery portion), is filtered through the blood vessels of the brain causing anæmia and subsequent head symptoms." That is why these symptoms yield to Warner's Safe Cure. It gets rid of the Bright's Disease, and prevents the blood from becoming watery.



---

of two Acres at a sitting. A man, a boy and a horse can operate it. No heavy Chains or rods to handle. The crop on a few acres the first year will pay for the Machine. It will only cost you a postal card to send for an Illustrated Catalogue, giving price, terms and testimonials. Address the Manufacturers,

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

THE OWNERSHIP OF MANURE ON RENTED LAND.

E. J. H., Leavenworth, Kan.—Has a tenant a right to remove manure made on the premises?

ANS.—That depends on circumstances. Manure made on a farm from the consumption of its products, is generally considered as belonging to the realty or land, and will pass with the farm if sold. This rule rests on the ground that for the benefit of husbandry the manure produced on the farm should be there used. In New Jersey, however, manure is held to be personal property and does not pass with the real estate as a part of it. As between landlord and tenant, whatever manure is made by the consumption of the produce of leased land becomes the property of the landlord, though lying in heaps and made by the tenant's cattle from crops which belonged to him till consumed—even though he be a tenant at will only—and in the absence of any express stipulation on the subject, an out-going tenant has no right to remove or sell it to be removed. If he removes it, he commits an offence for which the landlord can obtain redress, and if he sells it, the sale vests no property in the buyer. Of course, the tenant has a qualified right in the manure for the purpose of applying it to the farm This rule does not apply to manure made in livery stables or out of the ordinary course of husbandry, or from products obtained elswehere; for manure so made is personal property and may be removed by the tenant at the close of his term.

D. E Z., North Leverett, Mass.—I have a clay bank beside the highway. Have the town officials a right to set off an acre or more, for repairing the road? Can they set their own value on it?

ANS.—Is it a turnpike, county or township road? The rules with regard to the three kinds vary somewhat, so that a more definite answer can be given if the kind of road is mentioned. As a rule, any person who may think himself aggrieved by the action of the highway officers, either in laying out, altering, repairing or discontinuing a road, or in taking materials for making or mending it, may, at any time within 60 days after the officers' determination has been filed, appeal to the judge of the county, who shall appoint three disinterested freeholders, residents of the county, but not of the town, to hear and determine the appeal.

S. W., Waterbury, Conn—A makes an offer to B for B's farm and B accepts the offer. An agreement is drawn up and signed by them and witnesses, stating the terms. When the deed is to be delivered and possession given, A pays down a small amount for which B gives a receipt. At the time he was sober and apparently sane. A is ready to take the farm; but B refuses to give a deed for it, giving as a reason, that he was not mentally competent to make a contract, and it is now sought to have a conservator appointed over him. Can A compel B to give a deed for the farm and possession of it, if a conservator is appointed over him.

ANS.—Probably not; such an appointment would indicate that he was not mentally capable of making a valid contract when he signed the agreement.

R. E D., (address mislaid).—In 1887 I had a lawsuit and the lawyer asked me to sign a note on the understanding that if I gained the suit, I would not have to pay the note. I did gain it and the lawyer got $250 for his work. I lost $100. Then the lawyer served papers on me for the amount of the note. I told him I could't pay it, and that he must give it up. He withdrew the suit then but said he would get judgment against me. Can he do so?

ANS.—For what consideration was the note given? The case isn't quite clear; but judging from the rather confused statement, it is very likely the lawyer can do as he threatens.

Various.

THE A, B, C, OF GOOD GARDENING.

ARRANGE your entire garden in long rows for cultivation by horse-power.

Build a hot-bed to start early lettuce, radishes, and plants for transplanting.

Cart all brush, vines, and other rubbish together, and burn them before you are ready to plow. You are always in a hurry then, you know.

Draw a plan of your garden on paper, marking the spaces assigned to the different vegetables.

Endeavor to grow a succession of peas, sweet corn, radishes, lettuce, etc.

Firm the soil over all seeds sown, when it is not wet enough to pack.

Gather all early peas, cabbage, etc. as soon as matured, and use the ground for late turnips, beets, celery, etc. This is more profitable than leaving it to grow up to weeds.

Hoe! hoe!! hoe!!! around the young plants, the oftener you hoe, the faster they will grow. This is one great secret (?) of early vegetables.

Irrigation by some means is a necessity for growing good cauliflowers on dry soils, in a dry season.

Jot down any bits of information about gardening, for future use; they may be lost if you trust to your memory.

Keep the ground clean and thoroughly stirred while the plants are small. A few radish or turnip seeds sown with onions, celery or other slow-germinating seeds, will enable you to work between the rows much sooner than you otherwise could.

Lima beans require a warm, light, rich soil, and should be planted eyes down, around the poles, four to a hill. They require extra care, but will wel repay it in the delicious product.

Manure melons in the hill with well-rotted yard-manure, mixing it well with the soil before planting the seed. Plant shallow, after the ground is warm.

Never, never, make a garden on cold, wet, springy, undrained land, nor on land filled with quack roots. Better buy your garden truck

Onions grow larger on muck, but those of the best quality are grown on upland. Quality at the expense of size.

Peas and potatoes for early use if planted before the ground is warm, should not be covered deeply, or they will be a long time in coming up.

Quality should be the desideratum in vegetables grown for home consumption. Unfortunately for the buyers, they usually pay more attention to size and fine appearance than to quality, and the market-gardener must govern himself accordingly.

Radishes, to be crisp and tender must be grown very quickly. A heavy dressing of coal and wood ashes worked into the soil, and frequent applications of liquid manure will secure both rapid growth and exemption from worms.

Stir the soil around the cabbages, corn, potatoes, etc., as frequently as possible, especially after a rain. Nothing is more favorable to rapid growth. "Hoe cabbage every morning before sunrise" is an old maxim.

Tomatoes are less liable to rot if trained on a trellis, than if allowed to trail over the ground.

Unceasing warfare on insects is the price of a good garden. Paris green in plaster or water for the Colorado beetle, and a much weaker solution for melon and other vines; and dry ashes sifted over plants when the dew is on, for the flea-beetles, are cheap, handy, and very efficient.

Vigorous-growing plants are less liable to serious injury from insect attacks, than are those which are weak and spindling; hence the wisdom of inducing a rapid growth.

Weed all small truck while the weeds are small. If left longer, they take the strength of the soil from the vegetables, and increase the danger of uprooting them in removing the weeds.

Xcellent beets, turnips and similar roots are grown for family use by sowing the seed late in June or early in July, thus inducing rapid growth and tender flesh.

Yard-manure should be well rotted before being applied to a garden, else many troublesome weeds will be introduced.

Zero weather is not very favorable for actual work in the garden, but is just the time to study new methods, plan the season's work, study the catalogues, select and order seeds, implements, etc., that no time may be lost when spring opens. F. H. V.

SOME OLD FASHIONS REVIVED.

THERE is at present a revival of old fashions steadily going on. Popular favor has returned to many of the customs of early times and our homes are rapidly assuming an air of the past.

The old spinning wheel has returned from exile and forms a conspicuous and interesting ornament in our homes.

Quaint old tapestries, rugs and articles of furniture have been restored to deserved popularity.

There is a reason for this revival.

Our ancestors were of the substantial kind and their tastes were accordingly marked.

They looked to their personal comfort and when it was attained they stopped.

Fashion's foibles had no charm for them and in mind and person they were the equal of any people the world has yet seen.

Quick in perception and accurate in judgment, they soon detected the cause of any Physical discomfort and as quickly applied the proper means for the removal of it.

Conspicuous among some of the old fashions recently revived has been the reproduction of some of our grandmother's early time home cures, which are now holding a deserved position in popular favor, under the name of Warner's Log Cabin remedies and include a Sarsaparilla for the blood, Hops and Buchu for the stomach and system, Cough Remedy for colds, Extract for internal or external pain, Hair Tonic, Rose Cream for catarrh, Plasters and Pills.

For purity, simplicity and for their genuine beneficial properties they are unequaled and are worthy of our good old grandmothers, who first produced them.

May there be a revival, by their use, of the good health and long lives of early times!

CATALOGUES, ETC., RECEIVED.

PEACH YELLOWS.—A Preliminary Report by Erwin F. Smith. Such is the title of Bulletin No. 9 from the Botanical Division of the United States Department of Agriculture. It is a volume of 212 pages and 37 plates, containing all the trustworthy information that Mr. Smith has been able to gather during 16 months of continuous observation and inquiry. In spite of the mass of information given in this volume, we do not see that the public is made much wiser as to the cause of the disease. Mr. Smith gives the following list of "conditions known or supposed to favor the disease"

(1) Climatic conditions.
  (*a*) Non-adaptation of the peach to our climate.
  (*b*) Supposed general change in climatic conditions.
  (*c*) Early autumn frosts.
  (*d*) Cold winters.
  (*e*) Excessive rain-fall.
(2) Earth conditions.
  (*a*) Exhaustion or infertility of soil.
  (*b*) Wet and rich soils.
(3) Artificial or culture conditions
  (*a*) Neglect of cultivation.
  (*b*) Neglect of pruning.
  (*c*) Excessive use of nitrogenous manures.
  (*d*) Degeneracy due to continued propagation by budding.
  (*e*) Propagation by means of imperfect or diseased pits.
  (*f*) Diseased buds.
  (*g*) Spread of the disease by infected pruning knives or saws.
  (*h*) Nurseries not responsible for all of the outbreaks.
(4) Mechanical or vital injuries.
  (*a*) Injuries by men or quadrupeds.
  (*b*) Injury by borers.
  (*c*) Root aphides.
  (*d*) Fungi.

AGITATOR THRASHER.—Catalogue from the J. I. Case Thrashing Machine Company, Racine, Wisconsin. This is the 46th annual catalogue issued by this house. It fully describes and illustrates the excellent thrashers which have made a reputation for Racine. There is also a very good list of boiler and saw-mill outfits noted in the catalogue. A novel and exceedingly valuable feature is introduced in the form of "Case's Catechism" This is a series of questions and answers bearing upon the proper mode of running a steam engine. We have frequently had inquiries from those who desired to know how to run a steam engine. This catechism is about the best answer that we have seen.

ALABAMA AGRICULTURAL EXPERIMENT STATION, Auburn, Ala.—Bulletin No. 4 of this institution treats of the culture of strawberries, grapes and raspberries. These are subjects that ought to interest Southern farmers.

NEVADA EXPERIMENT STATION.—Bulletin No. 2 is sent by Leroy D. Brown, Reno, Nev. The bulletin deals with "The interdependence of plant life and climate conditions of Nevada." We do not see that this subject is of any great value to the general public.

EXPERIMENTS IN ARKANSAS.—The First Annual Report of the Arkansas Experiment Station, Fayetteville, Ark., is a very creditable volume. It is sent by Director Albert E. Menke. It will be impossible for us to speak of all the experiments noted in this volume. The station is very young yet and consequently this report must be largely devoted to introductory work, the formation of a base upon which to rear solid results. It seems to us that the Arkansas Station has made a most excellent start in the right direction. The indications are that it will prove a source of profit to the State. The Station officials seem to think that Arkansas should become a sugar-making State. Elaborate experiments with sorghum have been started, and it is proposed to find out all that it is possible to know regarding the chances of sorghum sugar in Arkansas. Experiment with potatoes, small fruits, fertilizers, dehorning, and vineyard work are also recorded

FOOD ADULTERATION IN NEW JERSEY.—Report of the New Jersey Dairy Commissioner, from William K. Newton, Paterson, N. J. It is the duty of the New Jersey Dairy Commissioner, to collect and analyze samples of the various foods offered for sale in the State and to see that the laws regarding the use of food adulterants are enforced. During 1888, 623 articles of food were analyzed. Of these, 320 were pure and 303 adulterated or below the standard. It appears that a considerable quantity of oleomargarine is still sold in New Jersey, notwithstanding the fact that only 28 licenses for its sale were granted during 1888. Of milk, 121 samples were examined and 43 of these found to be below the standard. A number of milkmen were detected in an effort to sell skimmed milk for whole milk and the milk from diseased cows was detected in several cases. The Commissioner states that a large proportion of the lard offered in New Jersey was adulterated. He estimates that not over 1,000 pounds of absolutely pure "leaf lard" is made in the State in a year. American canned goods were generally pure and wholesome. Traces of tin are frequently found in such goods, but it is not believed that tin is a poison. Out of 16 cans of imported canned vegetables, copper was found in 11, and only eight pure samples out of 24 specimens of coffee were discovered. Coffee adulterants are generally harmless however. Ground spice is seldom pure, extracted honey and maple sirup are often adulterated and "soda water" that is stored in bottles with metal stoppers is found to contain lead in damaging quantities. The whisky of New Jersey sustained its general reputation for vileness. Only three samples out of 15 examined could be considered "standard." Brandy and gin were even worse. The Commissioner is surprised to learn how rapidly the opium habit is increasing, and how much of this deadly drug is sold at country grocery stores The report contains considerable information that will be interesting to Jerseymen.

NATIONAL EDUCATIONAL ASSOCIATION.—The proceedings of the meeting of this association, which was held at Washington in February, 1888, are sent out by the Bureau of Education. This volume should be full of interest to teachers. Some of the most noted educators in the country contribute articles on topics that seem to lead up to the true principles of education. Here is the first paragraph we find in the detailed report. It is the opening of an essay on the importance of manual training in the public schools.

"The effort to avoid labor is the chief curse of the human race Idleness is a social crime. Work is the law of life, and hence the duty of all." We most earnestly commend this pamphlet to the thousands of men and women who make a business of training our children.

LUBURG CHAIRS.—Catalogue from the Luburg Manufacturing Co., Philadelphia, Pa. A special feature of the business done by this house is the abandonment of wholesaling. It is now proposed to sell direct to all consumers at the lowest known factory prices. This manner of doing business is becoming very popular and always meets with the approval of customers. Those of our readers who want to procure a baby coach, a reclining chair, an invalid chair, or in fact any sort of a comfortable seat will do well to procure this catalogue and read it over.

Miscellaneous.

NEW LEGISLATION NEEDED CONCERNING MONOPOLIES.

No. 3.

PRES. W. I. CHAMBERLAIN.

PRIVATE property, if wisely invested and managed in railways has its natural rights as property, to fair interest on the investments, insurance on the risk, and compensation for the skill displayed and labor expended in its management. But such property has by its very nature sharp limitations.

First. Railways are by their very nature virtual monopolies for their "suction ranges," (as O. W. Holmes terms it for colleges and cities.) That is, railways are virtual monopolies for the belt of territory for which they furnish outlet. This is clearly true for non-competing points, and under "pooled rates" and division of receipts there are no competing points as between railways. Natural waterways and State canals owned by the people can and do compete for slow freights, but not for perishable or fast freights or for passengers; and except for short distances horses on common roads cannot compete with steam on steel rails either for freight or passengers. I assume, then, that by their very nature and environment, railways, when once built, naturally become virtual monopolies. This point is susceptible of full proof. As monopolies, their operations should be regulated by law for the welfare of society. For it is a fundamental principle of our government, one for which our fathers fought in the revolution, that there should be here no privileged class authorized to levy unrestricted tax on the many. But an unrestricted monopoly on a necessity means exactly that—an unrestricted power to tax, a most dangerous thing with human nature what it is. Indeed we may as well fix it in our own mind clearly and once for all that it is one chief function of every just government to protect the ignorant against the overreaching of the learned, the weak against the violence of the strong, the simple against the cunning of the crafty, and the poor against the possible injustice of the rich. Even in reference to this single function, the "*laissez faire*" theory of government breaks down entirely. There must be something of the "paternal" element in government, or it cannot be a power for righteousness," justice, civilization, growth.

Second. Railways are *public servants*, *common carriers*, clothed by the public with most valuable public franchises. That is, the Government, the agent of the people, or rather the *soul* of which society at large is the organic body, so to speak, the Government gives to the railway companies its own right of "eminent domain" to lay their tracks, buying their road-bed and right of way *at a fair valuation* through private property, often unwilling, sometimes even hostile. For, while all of us want railways in territory yet unoccupied, none of us want them to come, where for the good of society they sometimes must—exactly through our farm, between our house and barn. The true theory of "eminent domain," by the way, rests, not upon the assumption that Government does or did own the land, but upon the fact that society must have arteries and veins for commerce, and that therefore Government, the agent, executive, brain, or personality of socie-

"RAT CATCHERS."

DRAWN FROM LIFE. See page 247. Fig 91.

ty, must see that these arteries and veins are opened as needed, and kept open. The same ultimate authority that opens wagon roads in the country, and streets in the city, opens railways through unwilling private land. The railways are as truly public thoroughfares as the roads and streets, though made and managed by private capital, somewhat like turnpikes and plank roads of old. And even as the turnpikes were gradually bought or taken by the county or State, the toll-gates taken down, and the roads owned, repaired and kept wholly at public cost and for the general good, and as the Post-Office system has all the time been owned and managed by the Government solely for the good of society, so if the good of society should ever seem to require it, might the Government take the railways into its own hands by purchase on appraisal, exactly as it at first authorized the railway companies to take their road-beds from the farmers on appraisal and purchase.

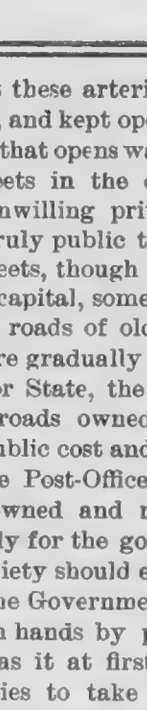

Fig. 87.

To deny this is to deny the right of Government itself to render a needed public service, which yet it has a right to authorize others to render.

Clearly the Government has no right to authorize railway companies to take, even by purchase on appraisal, the lands of unwilling private owners, except on the ground that railways are needed as public thoroughfares, and in order, and provided that the railways may serve the public reasonably, impartially and well, with no sudden changes in rates to shock and disturb business, with no secret rebates or discriminations for or against persons or localities. Clearly the government has the same right to regulate freight rates that it has to regulate passenger rates. The latter right is seldom questioned by the railways; the former right is often sharply questioned and bitterly resisted.

The fact that the wise adjustment of freight rates is a matter of great complexity and difficulty, does not prove that such an adjustment is not needed by the public, but exactly the reverse. The very fact of the intricacy of the problem makes it the easier for the railways to overcharge or discriminate if they are left wholly free by law to fix their charges as they will. It is a matter, however, that calls not for passionate recrimination and warfare, but for calm study and most earnest and candid deliberation. Never shall we secure laws both wise and just until we are as anxious to protect the real rights of the private property invested as to guard the public interests involved, and vice versa. If society and government make unjust demands against the railways, it will react injuriously upon society. We shall be more likely to succeed, however, if we make an earnest effort, than if we give up in despair. Free competition will not regulate the matter, for in reality, as seen, we have not free competition, but virtual monopoly backed by public franchise.

Third. Another sharp limitation arises from the fact not often noticed, though hinted at above, that the railway companies *are not inventors* except in minor degree, hence should not, as they sometimes seem to do, claim the rights and profits of inventors. The great predominant inventions that give them their vast carrying power,—steam-engine, locomotive, graded road-bed, solid, parallel steel rails and the like—these overshadowing things, I say, *are not the inventions* of the present railway companies or managers. These with the vastly increased carrying power they confer, long since became the property of the general public, with the lapse of the patents that once covered them. It is not enough to say that the railways carry cheaper than teams and wagons can. Of course they do. That is just what these great inventions of the past enable them to do. It is, however, a curious fact illustrating this hidden fallacy of argument, that one of the first railways built in Iowa based its local rates upon the actual cost of wagon transportation on dirt roads, *mud* roads, usually in the then new country. This was an absurdity, an utter ignoring of the existence of steam engine and iron track as ideas then and agents then belonging to society, to the world at large.

Rural Topics.

THE RURAL NEW-YORKER WOMEN'S National Potato Contest.

Instructions to be Observed in Competing for the Souvenirs.

THE plot must not be *less* than 1089 square feet, or one-fortieth of an acre. The rows must be equally (*i. e.* approximately so) distant from each other whatever that distance may be. The seed-pieces must be planted at an equal distance apart in the rows, trenches or drills. Any kind of manure or fertilizer, or both, and in any quantity, may be used. Any variety of potatoes may be planted.

2. The plot, whatever the size, must be settled upon on or before April 30, though it may be planted earlier or later in the presence of two witnesses. If *larger* than one-fortieth of an acre, this fact will have weight with the judges to this extent: *All things equal, or nearly so, the larger plot will draw the higher premium.*

It is *imperative* that each contestant should *devise* the entire plan of the contest and *superintend every* part of the work; see the land prepared, manured and fertilized; the seed cut, planted and covered; the insect-exterminator prepared and applied; the crop harvested, weighed, etc., according to the instructions which follow. It is *not deemed imperative that a contestant should be constrained to do the work with her own hands.* The R. N.-Y. has considered this carefully in deference to many who have expressed the opinion that each contestant should perform the entire work. But it should be borne in mind that many are physically unable to do so and

Fig. 88.

it would be manifestly unfair to rule them out as ineligible for that reason. In this "Contest" there is no justice in exacting of women what in similar competitions has never been demanded of men.

3. The full reports must be received before November 1st next.

THE REPORTS.

The following particulars must be given in the reports:

1. Size of the plot.

2. Whether the land is rolling or flat, sandy or clayey, moist or dry, naturally or artificially drained.

3. What was raised on this land for the three past years and about how much crop of each was harvested? How much fertilizer or manure was used?

4. When plowed or spaded, how deep?

5. What and how much manure or fertilizer was applied? The approximate cost of each?

6. When planted, the variety, *size* of seed and average number of eyes; total *weight* of seed; how planted, *i. e.*, in hills, drills or trenches; the depth?

7. Give an account of the weather from planting until harvest, whether wet or dry, hot or cool, etc.

8. State when and how often cultivated; how deep, with what implements.

9. Give the approximate hight of vines, size of stems, date of bloom.

10. At what date they began to die; when dead?

11. What was used to kill potato beetles; how often applied; how applied?

12. The date of harvesting.

13. State how many bushels altogether (60 pounds to the bushel). How many bushels of marketable; how many of unmarketable?

N. B. *All potatoes weighing less than three ounces to be considered unmarketable.* Absolute exactitude in this will not be insisted upon.

14. State whether the potatoes averaged shapely or unshapely; eyes deep or shallow; smooth or otherwise. If scabby, state what was deemed the *cause* of the scab.

15. *If engaged in another "Contest" state wherein you would proceed differently.*

FINALLY.

The following certificates must accompany each report:

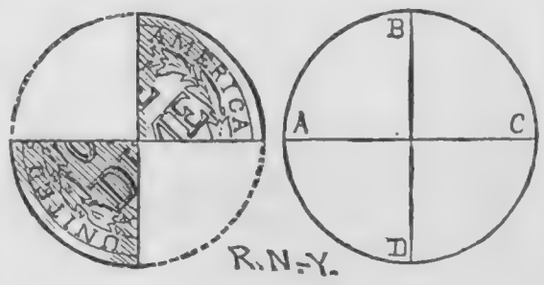

Fig. 89.

FIRST.

I do hereby affirm that the report herewith sent you is true in every particular.

JOHN JONES.

Jonesville, Jones Co., Ohio.

SECOND.

We do hereby affirm that we measured the plot of John Jones and found it of the exact area he states. We further affirm that we saw the potatoes dug and weighed as they were dug and that his statement is correct.

SIGNED, JAMES BROWN, CALEB SMITH,

Jonesville, Jones Co., Ohio.

Field Crops.

"CONTEST" CRITICISM.

WHAT WOMEN WRITE CONCERNING THEIR CONTEST.

FROM ILLINOIS.

My husband, though not a farmer or gardenere xcept so far as potatoes are concerned is enthusiastically in favor of the Women's Potato Contest. His increasing enthusiasm in the matter has awakened an answering echo in my own mind. Therefore, please, enter my name as one of the contestants. My husband has for years taken pains to fix up our kitchen garden plot in the highest state of fertility, and says I may take my choice in this rich garden plot; I shall also help myself to his fine compost heaps of leaf-mold, and to the best commercial fertilizer the markets afford. And as to varieties to plant, we already have almost every novelty in the potato-line grown in the country. Then we have almost every kind of garden plow ever invented; and let me tell my sisters to use Cole's garden plow. With this easy-running implement it is only fun to cultivate the garden. We take so many agricultural papers that I am making myself believe I am as well posted in potato culture, as "Joseph." In your efforts in favor of progressive agriculture, and in bringing about some useful employment and out-door exercise and healthful recreations for us poor, cooped-up women you have my best wishes and heartfelt thanks. MRS. J. W. BAKER.

Bureau County.

FROM ALABAMA.

My husband, though an M. D., has been a constant reader of your good paper for some years, and I, (little dreaming that through weary months of sickness he would be driven into abandoning work in his chosen profession) have often laughed at him for perusing your paper and catalogues, which he always claimed rested him. Last November while I was very sick we decided that change of climate and change of occupation, were what we most needed to restore us to health. So while I was so ill that it seemed almost like a farce, my husband sent in my name to you as one of those who would enter the lists of contestants in the Women's Potato Contest. We came South in December, planted potatoes the 15th of February; aside from my little contest plot, we put in six acres of Beauty of Hebrons. From the day we began the work our health steadily improved. I think you deserve great credit and many thanks from delicate ladies, for thinking of the plan of the Contest, etc., to induce women to work *out of doors more.* My little plot of potatoes will not be ready to dig till the first or second week in June. As to the division of souvenirs, etc., you know the average number of bushels per acre is less in Alabama than in Wisconsin and other States either East or West, as given by the Agricultural Reports of the United States. I presume there will be very *few* competing for the prizes in the South, but I hope that those who do will not labor under any undue disadvantage arising through dividing the country into East and West, as you spoke of doing in a late number. When my name was sent to you we were at our home in Eau Claire, Wisconsin. I hope I may be one in the South who will win, as I have done all the work with my own hands.

Wheeler Station. M. B. H.

FROM MASSACHUSETTS

Why not conduct the Women's Potato Contest in the same manner as the one in which you took part last year? Let there be no minimum size or weight to constitute a "merchantable" potato, but rather let the entire yields be estimated by weight only, as that is the only accurate and honest method to ascertain the true amount raised by each contestant in the United States

I would also like to cross out one other idea. Why say anything as regards cost of producing the crop. It seems to me that this Women's Contest should be conducted in a purely business-like manner just the same as though the participants were men instead of women. Among the prizes offered by the Mapes Co., and others, I see nothing regarding cost of production: it simply means the man who gets the largest yield from one acre. One party might be able to select a plot where it would need no fertilizer to raise a good crop of potatoes, while others, like the writer, could truthfully say, one year ago the plot was too poor for bugs to live on. Yet, health being spared, I have great hopes of that little piece of ground.

Fig. 90.

Am I alone in saying that the first prize should go to the woman who gets the largest yield and does the most work with her own hands? Supposing I tell my husband just how to do the work, and at harvest time, my plot gives the greatest yield. My neighbor over the way has done all the work on *her* plot (excepting plowing, harrowing, and applying the manure) and she gets within a small amount of my yield. By the labor of both head and hands she has *earned* that first prize and ought to have it. MRS. F. L. AVERY

I am much pleased with your success in creating an interest in the Women's Potato Contest, but I do think your condition about the "crop grown at *least cost*" is manifestly unfair. What chance has a woman on some of New England's barren fields in competition with her sisters in situations where the soil has all its virgin fertility! In New England, in many places the natural soil will not produce 20 bushels of potatoes to the acre.

All the fertility must be purchased, adding very much to the cost of the crop. Also the soil is in many places very stony, thus adding to the cost of cultivation, digging, etc. To be just, let the factor of cost not be considered. If it is, many in New England will not use as much fertilizer as they would like to for fear that if they get the biggest yield they will not win on account of the cost. My little girl wants to try and will do all the work except team work and putting on manure. She, last year, covered an acre of potatoes planted in drills one hoeful of soil to each piece and with her sister, put slug-shot on 1½ acre in one day. E. D. G.

Ashburnham,

FROM KANSAS.

I should never presume to dictate to the RURAL. It would seem to me as cruelly presumptuous as to question the wisdom of one's parents. I have been a reader of its wisely conducted pages since a little girl, and it has long since become the oracle in our family in all matters pertaining to the farm. Now in regard to the potato contest. It seems to me such a grand idea of the editor to allow the ladies a chance to show what they can do, but it does seem to me that to be a fair competition one ought to do all the work, except, of course, perhaps breaking up the ground. Thirty-three feet is a very small space, no more than two good-sized rooms, only one-fourth the size of the garden that I have tended for the last 10 years. Now if brother or husband does the work, turning it over to wife, or daughter, or sister, when the work is done, he merely competes for the prize through wife or sister; such a one would seem to me only a fraud, not a fair and honest competitor. Now I expect to do *all* the work on my little plot, even to the breaking up of ground with the riding plow, and I would so hate to be beaten by some other farmer's wife who only sat comfortably in a rocker glancing now and then out at the work being done by the "hired boy." MRS. L. F.

Johnson County.

In presenting my name for "membership" in the "Potato Club" it is needless to say that I do not expect one of the coveted prizes, but it looks to me as if there is fun ahead for all parties engaged in the contest, and I want a share of it. As has been suggested, it seems to me that the "National" plot should be divided into districts, with a grand sweepstake prize. Then, too, would it not be well to give the weight of the *entire* yield, as well as that of merchantable potatoes?

The funniest thing to me is the general desire on the part of the ladies to win the prize *justly* by "*doing all of the work myself.*" I took the Editor's offer to mean a prize for the most successful *method*, his aim being to ascertain *the best way* to grow a large crop of potatoes, that being what he sought in *his* famous "contest plot," and these ladies who seek to earn their prize *honestly* have never inquired whether the Editor of the R. N.-Y. performed *any* or *all* of the manual labor, or simply directed the *manner* in which it should be done. In short, wasn't that contest, and isn't the coming one, more a trial of *methods* than display of *muscle*?

Junction City. MRS. H. H. C.

FROM DAKOTA.

Many women, like myself, if they engage in the project at all, must do so at *very little* or no cost, and we would have a much poorer chance in comparison with those who can use any quantity of fertilizer, than the New England woman 'in her barren fields,' as compared with virgin soil. The New England woman will probably have the best place in the garden, too. The pioneer has to wrestle with unsubdued soil and drought.

Huron. MRS. W. A. B.

FROM MICHIGAN.

I think the potato contest a grand thing. I do not think it will be right for women to contest against men. I think we ought to do all the work except plowing and drawing the manure. Such work will suit me, I can watch the bees and tend my patch of potatoes as well as my garden. MRS. J. E. K.

Marlette.

FROM PENNSYLVANIA.

I think there should be two classes. We intend to do all the work but plowing ourselves. We expect to use newly-cleared land and shall try the RURAL'S method of planting. We live on a hill where frost comes late in spring and early in September. The only corn we can ripen is the Cory, Northern Pedigree and Pond corn sent by the RURAL two years ago.

MRS. R. A. CORD.

Cameron County.

FROM NEW YORK.

I wish to send you my name for the Potato Contest. I believe it will be a help to hundreds of farmers' wives who now have but little, if any interest in out-door farming. You have my hearty co-operation in anything which will lead to breaking up the monotony of cooking and washing dishes.

Tioga Co. MRS. W. M. S.

RURALISMS

Experiment Grounds of the Rural New-Yorker.

EFFECTS OF DIFFERENT QUANTITIES OF FERTILIZERS ON POTATOES GROWN IN A VARIABLE SOIL.

Plot 30—220 pounds, yielded at the rate per acre of		258.50	bushels.
Plot 36—220 pounds		205.33	"
" 40—220	"	172.33	"
" 31—440	"	298.83	"
" 37—440	"	253...	"
" 41—440	"	253...	"
" 32—880	"	282.33	"
" 38—880	"	227...	"
" 42—880	"	231. .	"
" 33—1320	"	228.16	"
" 44—1320	"	242...	"
" 34—1760	"	280...	"
" 39—1760	"	242...	"
" 43—000	"	161.33	"
" 35—000	"	132...	"

SUMMARY.

The average crop of the plots that did not receive any fertilizer was at the rate per acre of		146.66	bushels.
220 pounds gave		212.05	"
440 "	"	268.28	"
880 "	"	246.78	"
1320 "	"	285.08	"
1760 "	"	261...	"

As has already been stated the soil of these plots, naturally variable, was made exceedingly so by grading, the soil from the higher parts having been carted to the lower places. It is in some parts a sandy loam, in others a clay loam, and in still other parts a stiff brick clay—all impoverished by years of cropping without any manure of any kind. It will be remembered by older readers that the R. N.-Y.'s potato experiments previous to last year were made on plots of notably uniform soil, so impoverished that anything short of a "complete" fertilizer failed to materially increase the crops, while it was found that as high as 1760 pounds to the acre could be profitably used. In the present trial it will be seen that 440 pounds gave more crop than 880 pounds, and that 1,320 pounds gave more than 1,760. To what extent this contradictory result may have been due to the flea-beetle can not be estimated.

The variety planted was the Rural Blush. Some of the vines were greatly, some slightly, and a few not at all, injured by the flea-beetle.

The fertilizer used was the Stockbridge Potato.

Entomological.

A NEW INSECT PEST.

JUST as diseases due to microscopic organisms suddenly appear and become epidemic among men and animals, so every few years a new insect appears and increases so rapidly as to cause great havoc in the vegetable world. Between 1850 and 1860 the moth called Liparis monacha appeared in the vast forests of East Prussia. In a few years the larvæ of this insect, in spite of the collection of 300 pounds of eggs, or 150,000,000 single eggs, and the destruction of 1,500,000 female moths, transformed over 30,000 acres of forest into a desert covered with lifeless trunks. At another time a species of grasshopper, Zabrus gibbus, utterly destroyed vast areas of wheat and rye in Bohemia and the vicinity in the space of a few nights.

In the "seventies" the little pine tree borer (Bostrichus typographus) ruthlessly destroyed the finest old trees in the Bohemian forests. The devastation wrought by the Phylloxera in the vineyards of France, Hungary and parts of Germany is fresh in the minds of all.

The latest pest hails from Sweden where it has recently created great havoc, especially in the barley and rye fields. The State Entomologist of Sweden, Holmgren, reports that on the island of Gothland, barley to the value of nearly half a million dollars was destroyed by the larvæ of a species of fly, the scientific name of which is Chlorops tæniopus. The same insect destroyed fully a third of the rye crop of the province of Upland. The length of the perfect insect is from one and a-half to two lines. The general color is a brilliant yellow. The eyes are green, which circumstance suggested the name of Chlorops or "green-eyed." The feelers are short and black and end in round knobs. On the top of the head is a black triangular patch with the apex in front and there are three longitudinal black stripes on the back of the thorax. There are various black dots and marks about the base of the wings and on the sides of the thorax, and four transverse dark brown stripes on the top of the short abdomen. The legs are yellow except the extremities of the first pair which are black and in the male are crossed by a yellow ring.

The fly lays its eggs between the leaves before the ears appear. The eggs hatch in about ten days and the larvæ eat irregular furrows up the tender stalk, beginning at the uppermost joint. The edges of the furrows soon turn brown and knots and so-called "gouty swellings" appear. The development of the ear is arrested; it either remains hidden between the leaves or struggles to the light and puts forth a few imperfect grains. The larva when full-grown is about two lines long. The chrysalis stage is passed on the stalk or concealed in the ear. The pupæ have been found in July on barley plants which appeared perfectly sound, but when the leaves were separated, the inner ones were found to be dead, yellow and partly eaten and the stalk injured. The brown chrysalis was hidden among the leaves about an inch from the top joint. The chrysalis state lasts from 17 to 21 days.

There are many other species of Chlorops, similar in appearance and mode of life to C. tæniopus. Some of these have occasionally appeared in vast numbers and done much damage. In the autumn of 1857 a dense cloud was seen rising from the roof of a house in Zittau. The cloud had so much the appearance of smoke that energetic attempts were made to put out the supposed fire, but it was soon found that the smoke consisted of millions of small fire flies issuing from under a broken tile. The insects were of the species Chlorops nasuta. They were also found in immense numbers in other houses of the city.

The engravings, Fig. 87 and 88, are taken from a German publication. Fig. 88 shows the natural size of the insect, *a*, with an enlarged picture at *b*, and the stem of the plant at *c*. Fig. 87 shows the appearance of the stem after an attack. L. B. F.

Ulster Co., N. Y.

The Naturalist.

TERRIERS.

(*See page* 245.)

ON page 181 of the RURAL a good friend in Canada had the following:

"I very much admired the picture of the collie dogs in a late RURAL, but I would like to speak a good word for the Scotch terrier. If a couple of them are around, one will not need to protect the young apple trees with tar, felt or wire netting to keep off the field mice and moles. The Scotch terriers will save all that work. The owner can always see them hunting around in the grass wherever rats, mice or moles are to be found. As watch dogs, too, they are better than a burglar alarm. They will not let themselves be tampered with or bribed."

The R. N.-Y. can add little to this statement except to say that the picture on the first page (Fig. 91) are drawn from life. The little Scotch terrier at the bottom of this picture has entirely cleared his precinct of rats and mice. As a watch-dog he has more than once given an alarm at the approach of suspicious characters.

Farm Economy.

MONEY BY MAIL.

WHILE looking over some back numbers of the RURAL NEW-YORKER I saw an article describing how silver coins could be conveyed by mail. I enclose herewith sketch and sample of a device that I have been using for 15 years. I have found it very convenient and by means of it have sent money to all parts of the country without loss or damage to the envelop though silver will sometimes cause this when placed loosely in an envelop. Take a piece of stiff wrapping or card-board paper—the latter the better—cut a piece the size of the envelop, and set the pieces of silver to be mailed down on the card-board, one at a time. Put your fore finger on the center of the silver and with the right hand run a pencil around the silver marking a circle, then draw a line from C to A and from B to D; then take a pocket knife and cut through these lines; lift up sections B and D; put the coin under these letters and your money will go anywhere safely. To make this little arrangement will only take two or three minutes. Do not cut the circle.

W. S. B.

A CHEAP MILKING STOOL.

SAW off a leg of some light dry wood as long as the stool is to be high and six or eight inches in diameter. Flatten one side and nail a strip on and let it stick up behind for a handle, hang it up when not in use. Nail on it a piece of sheep-skin for a seat. See Fig. 90. E. B. S.

PARTIAL PARALYSIS DUE TO PREGNANCY IN A MARE.

E. C. R., Alden, Iowa.—I have a brood mare due to foal April 1. About a week ago I noticed that she appeared stiff in one front leg and that she seemed weak and that the muscles of her shoulders trembled. A few days ago she got up with difficulty, and soon lay down again and has not been on her feet since. That day she had twinges of pain frequently. The local doctor called it "colt-founder" and advised giving niter, two ounces, and laudanum one ounce. I gave her half that amount which relieved the pain. I have also bathed her spine with hot vinegar and salt, and am feeding her good hay and bran mash. She does not eat much and shows no desire to get up. What ails her and what should be the treatment?

ANS.—The weakness or partial paralysis is very likely due to the pregnancy, as such cases occasionally occur. Beyond advising that the mare ought to have been placed in slings and made as comfortable as possible, we can give no satisfactory course of treatment, because each case should be treated according to the symptoms as they develop from day to day. Good nursing is of prime importance. Keep the bowels open by feeding a nutritious, laxative diet. Scalded oats and bran are excellent. Give very little coarse fodder. Medicines are to be given only when necessary. Sweet spirits of niter in ounce doses for its kidneys; powdered gentian one-half ounce doses, quinine 10-grain doses, or citrate of iron and quinine, dram doses, two or three times daily as tonics, may usually be given with advantage.

AILING SHEEP.

C. H., Baldwinsville, N. Y.—I started in winter with 40 young, thrifty ewes. After three or four weeks I noticed that one of the flock did not eat as well as usual and after a few days she lost control of her hind limbs and appeared paralyzed. On close examination I found her lungs to be covered with purple spots, one of them being almost entirely purple although she showed no signs of lung trouble in breathing. From a peculiar look of the eyes and a movement of the head I thought at first the trouble was due to some form of staggers; but it was amenable to no treatment. What is the matter? I have been feeding cut corn-stalks until within a few days, when I began feeding good Timothy.

ANS.—The trouble was probably due either to the feed or too close confinement or both. The cut stalks, especially if smutty, musty or well ripened, would not be a suitable ration to feed alone. Such a diet would be very likely to produce indigestion, impaction and paralysis. Confinement in close quarters with little or no out-of-door exercise would predispose the animals to disease. You did well to change the feed, but it would have been much better if you had alternated the stalks and hay all winter. Or a small ration of grain should have been given with the stalks. When fed upon such coarse dry fodder, free access to common salt and water will do much to keep the bowels in a healthy condition.

STARTING A SMALL CREAMERY.

E. P., Beverly, N. J.—On my farm of 150 acres I milk 16 Jersey cows and retail butter the year round at 40 cents per pound. I would like to build two silos and keep 40 cows, starting a small creamery with a centrifugal separator, using the milk from my own cows as well as that of about 100 belonging to my neighbors; would this be practicable?

ANS.—Of course, the whole scheme is eminently practicable; the only weak point about it, that is discernible, is the limitation put on the number of cows—40—when the number, in a short time, should be 150—a cow to each acre. The two silos will be all right, provided they are made large enough, and constructed in a substantial and air-tight way. The use of a separator, especially when it is contemplated to make butter from the milk gathered from other farms, is not only right, but it is about the only really practical, and best method of getting all the cream from such milk, still leaving the skim-milk in the best feeding condition. For farmers with small dairies, not living contiguous to butter-factories that manufacture from milk, or those who wish to patronize a gathered-cream factory, iced creameries are excellent; but gathered milk, if butter is to be made from it, had better go through the separator.

VITALITY OF THE EGGS OF PARASITES ON SHEEP.

D. C. W. C., Cumberland, Ohio.—How is it that the eggs of parasites on sheep can be taken into the stomach without being destroyed? Will freezing destroy their vitality? I notice small white specks on the droppings of my sheep; what are they?

ANS.—In the case of those parasites in which the egg is taken into the stomach with the food (in ruminants this means the fourth or true stomach) the egg-case or envelop is digested off, setting the embryo parasite free. If the embryo is then alive it is able to resist the action of the gastric juices, which have no power to digest living, healthy tissues. After the young parasite has been set free it passes to that part of the intestine or system selected by that particular parasite as its habitat. The same principles apply to the other domestic animals as well as to sheep. So little is known of the life history of these parasites in their egg and embryo stages that we do not know under what conditions the eggs are destroyed, or what degree of cold they will resist. The white particles you notice on the sheep droppings are undoubtedly the ripe segments of tape-worms.

FUNGUS ON CARP.

J. H., West Granby, Conn.—I have about 100 German carp in a pond 10x12 feet, in which the water is two feet deep and furnished by a spring. The carp are troubled by a fungus and several have died within a few days. What is the matter?

ANS.—Marshall McDonald, the U. S. Commissioner of Fish and Fisheries, to whom this question was referred, sends the following answer:—"The fish are probably affected with fungus, a vegetable parasite present in nearly all waters. Bruises or sores on fish are its points of attack, and by its drain upon their vitality it causes death. The best remedy is to make a strong solution of salt and water, and dip the fish in it, allowing them to remain for two or three minutes, and then transfer them to fresh water. This should be done two or three times a week."

STERILITY IN A MARE.

G. P., Lost Creek, Va.—My 16-year-old mare had a colt when she was six years old; then she had no chance to get with foal for five years; but since then she has been to a stallion regularly; but has not got with foal. What can be done to get her with foal?

ANS.—Mares frequently fail to breed after they are 10 or 12 years of age, especially where they have not been bred regularly. There is probably no remedy. In such cases about the only treatment that can be given is to keep the animal in that condition most favorable for breeding, *i. e.* in good working flesh—not too fat, on a moderately rich diet, but restricted in quantity. Regular exercise is very essential; even hard work is often most favorable. Idleness and overfeeding predispose to sterility.

INFLAMMATION OF THE EYE OF A HORSE.

S. D. C., Ainsworth, Md.—My horse keeps one of his eyes shut nearly all the time. I put some sugar on it and it appeared to do good at the time; but did not cure it. Eye-water doesn't help it. The eye-ball seems to be dull and not so glossy as the other; but there is no film over it. What should be the treatment?

ANS.—Cover the eye with a cloth and keep it constantly wet with a solution of 30 grains of sugar of lead and 10 grains of morphia dissolved in a pint of distilled water or clear rain water. Give the horse six drams of Barbadoes aloes to open the bowels. Then keep the bowels slightly loosened by feeding roots or a bran mash once daily. Keep the horse in moderately good condition but do not overfeed.

KILLING WIRE-WORMS AND WOOD-LICE.

J. D. B., Modus, Conn.—How can I get rid of wire-worms and wood-lice in a rose-bed in a greenhouse?

ANS.—You cannot rid the soil of wire-worms, but you can trap a good many of them by burying pieces of carrots in the soil, examining these daily and killing all the wire-worms found on them. For wood-lice take two pieces of old half rotten boards, perfectly dry, and lay them one above the other in a dry shady part of the rose-bed. The wood-lice will crawl in between the boards. Examine these traps frequently and kill the insects with scalding water.

THRUSH.

J. W. C., Halifax, Pa.—All the frogs of my seven-year-old mare waste away and have a very offensive odor. She appears to be in great pain. What is the matter; and what should be the treatment?

ANS.—The disease is thrush. Cut away the dead horn and scrape the surface clean. Then press dry calomel on the diseased surface and well into the cleft of the frog. If thorough, one or two applications should be sufficient. Keep the feet clean and out of the wet as much as possible until well healed.

Miscellaneous.

E. A. H., Potsdam, N. Y.—A turkey of mine has a swelling just above her bill. It began last fall and has been gradually growing ever since. It is soft and when I press on it something like foam runs out of the eye. Another swelling is beginning on the other side. What should be done for her?

ANS.—Wash the head with warm vinegar and water every day for a week or more.

D. S. C., Catonsville, Md.—My 16-year-old mare had her first colt last May. I bred her again in August, and she aborted in March. Will it be safe to breed her again, and, if so how soon?

ANS.—Yes, after three or four months if the mare appears to be all right. Special precautions should be taken in her care to avoid all causes that would be likely to cause a repetition of the act.

H. T., Richmond Center, Wis.—At what temperature does an egg get so cold that it becomes useless for hatching?

ANS.—The safe rule is not to allow the temperature to fall below 85 degrees, though it does not follow that a point below this is sure to spoil the eggs. Too much depends upon the eggs themselves and the length of time they have been in the incubator. The eggs should be kept as near 103 degrees as possible all through the incubation.

P. M., Brucetown, Va.—My six-year-old mare passes soft droppings like those of a cow. She has never had a foal; is she likely to have one? She is healthy and works well?

ANS.—The general condition of the mare may be improved by giving her two tablespoonfuls of the following powders on her feed night and morning for a week. Then omit for a week, after which give the medicine for another week alternating for several weeks. Sulphate of iron four ounces, powdered gentian, ginger and niter each eight ounces. The only way to tell whether the mare will breed is to try her.

A. Q. McD., South Hartford, N. Y.—My father has a very fine herd of Short-horn cows with which a Jersey cow is allowed to run; will the offspring of the Short-horns be liable in any way to be marked like the Jersey?

ANS.—Many cases are on record where animals peculiarly marked have had an effect on the fetus or unborn young of animals of other breeds or varieties. When there is no sudden fright or worrying, there is probably no danger of variation from having animals of one breed running with those of another; certainly not after the animals are born.

A "Rural Reader," Tioga Co., Pa.—When my young grade Jersey cow came in in the fall she was nearly dry. We milked her until four weeks before she came in. One teat became inflamed and the milk thick and stringy. I gave her two doses of saltpeter and she was all right. Last week she calved and the trouble began again, and again the saltpeter was given. The milk comes all right now, although it is deficient in quantity. There seems to be only about a pint in that teat; but a nice lot comes from the others. What ought to be done for her?

ANS.—Since the trouble has already disappeared treatment is not necessary. The flow of milk in that quarter will probably gradually return. If it does not do so this season it will probably be all right after the next calving. The trouble was evidently due either to an injury to that quarter or to over-stocking while drying off.

W. H. L., Walton, N. Y.—I have a hot-bed for lettuce, two feet deep; how deep should the horse manure and soil be to give the best results? 2. How far apart should the plants be in the bed when thinned out? 3. Could I transplant some of them without hardening them by exposure and would such a course be advisable to secure a large crop for the market? 4. Could I sprout early potatoes by placing them in the hot-bed, then putting them in drills, the potatoes being placed between the seed drills?

ANS.—If two feet deep from the sashes is meant, 13 inches in depth of manure, four inches of soil, and seven inches of head room. But this is a shallow hot-bed. 2. It depends upon the variety; 10 inches is fair distance at this time of year. 3. Not safely. Why not make a small hot-bed for the seed, then in three week's time make another to transplant the seedlings into? In this way the plants not required for the hot-bed could be hardened off and planted outside. 4. Yes, but we don't think you would gain very much.

DISCUSSION.

"RHEUMATISM" AMONG HOGS.

J. W. J., SUGAR RUN, PA.—There is a disease common among young hogs, which is very well described by W. S. P., of Forestville, N. Y., and commented on by Col. F. D. Curtis on page 180 of the RURAL. I have frequently had cases of it among my hogs when kept in close confinement, and have two severe cases on hand now. They are both sows about six months old and expected to farrow in May. The one attacked first showed a little lameness in one hind leg, which soon extended to the other, then to all the legs and apparently to every joint in her body. There is a stiffness in the neck which can scarcely be bent sidewise, and all the muscles seem to be sore so that any movement or attempt to use them gives the animal pain. A few days after the first one was attacked, the other became afflicted in the same manner, but not quite so badly.

They lie still constantly, (generally flat on the side), except when driven up; they squeal with pain produced by their efforts to use their limbs and muscles. They have but little appetite and not much thirst; but will eat a small quantity when driven to the trough or when an ear of corn is thrown beside their noses. Since I commenced raising hogs 40 years ago, I have had a good many cases of the disease but never any so far as I remember that was fatal. They have always got over it after a while without any doctoring. Once I had a sow so bad that she had to be helped up, and as she would not eat; I let her lie and gave her up to die, only going to the pen twice a day to look in. She lay three or four days without eating or drinking, and then got up and came to the trough of her own accord, ate moderately, got well and had a litter of good pigs.

Mr. A. D. Hoag, a neighbor, told me that he had a sow which he kept for raising pigs until she was about four years old, and that every time she had pigs, at a certain stage of her pregnancy, a great lameness came upon her, but she would get over it before farrowing, have a litter of good pigs and do well.

His opinion is that pregnant sows are more subject to the disease than other hogs; but, according to my experience, boars are subject to it the same as sows. I had a boar once that was so stiff in his hind legs that, instead of stepping over the board between the sleeping apartment and the feeding room, he would jump his hind legs over together rather than bend them. Now if the disease was caused "by feeble bones and delicate joints," as Col. Curtis suggests, my boar would not have been likely to do this, as the jumping would have jarred the bones and joints and hurt him worse than stepping over.

I agree with Col. Curtis that close confinement and want of sufficient exercise have a good deal to do with bringing it on, but I cannot agree with him that the disease originates from improper diet. It certainly did not in the case of my hogs unless Col. Curtis himself recommends an improper diet, for with the exception of linseed meal, and the addition of milk, they have had the very food which he says is proper. Wheat bran, middlings and milk are what I always feed to my young hogs until I want to fatten them, and then I substitute corn-meal for the bran. In my opinion it would be hard to improve much on the food which W. S. P. had been feeding his hogs when they became "lame in their hind legs, and sore and stiff all over" unless he had milk to give them. The "boiled potatoes, wheat bran and meal" would keep their bowels loose enough and make them grow finely without linseed-meal. The advice to "turn them out daily and drive them about for a half hour," I cannot indorse, and would not have it done to my sick hogs if Col. Curtis would furnish the boy to do it for nothing. It is too much like the old way of trotting a sick horse up and down the road to cure the colic. If the weather were favorable I would turn them out of the pen and let them exercise if they saw fit, but to drive hogs as lame as mine, for half an hour, or for five minutes would be an act of cruelty that the Society for the Prevention of Cruelty to Animals might look after. I call the disease rheumatism, as it has usually come on my hogs during rheumatic weather, when it was damp, rainy, and the wind in the east. Up to the time my hogs were attacked by the lameness, they were so strong and active that they always jumped up when I went to feed them and stood on their hind legs with their fore feet against the side of the pen as easily as a dog would have done it. If their bones had been tender and joints weak they would not have been likely to do it, and the habit of doing it was favorable for strengthening their legs by the exercise it gave them. Col. Curtis is high authority on all farm topics, and especially in regard to the management of hogs, and it seems like presumption to disagree with him on a subject he has made a specialty, but as Mr. Terry would say: in Mr. Curtis's locality, on his farm and in his pens he may be right; but in my locality, on my farm, and in my pens, the case is altogether different.

RUNNING IN DEBT SOMETIMES A GOOD THING.

S. N., HARLAN, IND.—It has often been said that there are two sides to every question; but judging from what has been published in the RURAL from time to time, there is only one side to the question, "Shall a man run in debt?" A few things, however, can be said on the other side. I would say from personal experience that it has been good for me to go in debt, and I am satisfied I have made much more than it would have been possible for me to make if I had not done so. A man cannot make much money just by day's work if he has nothing else. He needs capital, and if he has it not, he must run in debt and use the capital of somebody else, and the more capital a man has the more profit he ought to have at the end of the year. I know that the man in a late RURAL cartoon was wonderfully bowed down with his debts, mortgages and taxes. It was a true representation of some, while others are not burdened by their debts but pay every obligation at maturity. I think M. H. W., on page 161, gives us the reasons why they are so burdened. He would name those riders, Intemperance, Lost Time, Waste, Dishonor, Ill-health, Crime, and I think in most cases he is right; but if these things are the cause of failure, why lay it to running in debt. If those who fail from these causes had been temperate, industrious, saving and punctual, they might have paid their debts and been relieved so they could straighten up. Now I know a good many men who commenced with nothing, worked till they could get enough to make a payment on a piece of land and run in debt for the rest, and paid it, and have a good home, whereas if they had waited till they had enough to pay for a farm, they might never have got one. Then I know a few men who as soon as they get a farm paid for, will run in debt for another, and so buy a farm every few years. I don't know how it is in other places; but I do know that any man who is economical and has the push that would enable him to succeed in any other business, can, in this country, buy a farm on time and pay for it.

An editor of the RURAL told us a year or two ago that he had bought a piece of land and intended to make the crops from the land pay for it. If he can do that, why should not others? It's not running in debt that plays the mischief, but it is running in debt for the wrong things. For instance, if a man goes in debt for nice clothes, when they are worn out they are gone—there is nothing left. Just so with something to eat, and with nice buggies and fast horses, and fine houses and thousands of other things that produce nothing. After a short time they are gone or depreciated in value so that there is a great loss; but when a man buys a farm, it ought to bring him in more than the interest and be worth as much at any time as when he bought it or more, so where is the loss? And if a man needs a horse or implement to do his work with, it is better to buy on time than to neglect his work.

The most of those that complain about their debts belong to the "farming-don't-pay" class

and don't take any agricultural paper; they are always too hard up and can't afford it. I commenced taking the Genesee Farmer when a boy about 18 years old and have been taking one or more agricultural papers ever since, and several times I have got ideas or facts from the paper one of which would pay me to take the paper as long as I live. I like the RURAL first-rate and expect to take it as long as I live.

EXPERIENCE WITH OATS.

A. T. T., FRANKLIN PARK, N. J.—That there is nothing certain excepting death and quarter day is an old saw whose antiquity does not lessen its veracity. From it may be deduced, also that all the world's an experiment. From the vantage point of the last half of an average life the experimental character of the world will be plainly discerned, which substantiates the triteness of the saying that our hind-sight is much better than our fore-sight, as during the first half of life we are quite apt to mistake mere surmises for actual truths. Of the experimental character of much of the results of his 365 days' yearly labor the farmer is tolerably well aware. To be sure he has it recorded that seed time and harvest shall not fail, but the variations of the unfailing seed time and harvest are so exceedingly multiplied that results, which are what he counts on, are too uncertain to be classified other than experimental. (No reflections intended on the RURAL'S sanguine attempts to produce a specified harvest of potatoes regardless of conditions.) A couple of years ago a writer in another farm paper advised that oats be sown in February on snow, stating that the crop would be as certain as if sown in the time of year formerly deemed suitable or even more certain, and, besides, it would be a month in advance of the old way. The writer of this article has not hesitated to enthuse at any plausible theory in this line and his personal investigations, it must be conscientiously admitted, have sometimes had a depressing effect financially. Repeated disappointments will after a time convince the greatest zealot that the best laid plans may come to naught; therefore it was with a laudable degree of prudence that this particular experiment was determined upon. A small piece of ground only was therefore devoted to the trial. During the latter part of February a small depth of snow presented the proper conditions, and a couple of square rods of ground plowed the Fall before were sown with oats. They were washed in properly according to rule, every kernel being nicely mixed in its muddy little bed. The wintry season was extended somewhat beyond the usual period owing to the inclement weather which *may* have militated against the anticipated crop. However, I did not look for sprouting oats before the snow banks had subsided, but I did look for them later and looked in vain. No oats were so green as to appear above ground by the middle of April. On cultivating the field the last week in April preparatory to sowing oats, the two square rods assigned to the early crop were found sprinkled over with a blackened and rotted mass of seed from which it was evident not even the faintest effort at vitality had manifested itself after being sown. If the soil is a light sandy one possibly oats might wash in deep enough to thrive, but if, on the contrary, it is a heavy clayey one the grain is much better off in the owner's granary until nature's own time has arrived. The writer once sowed a quarter of an acre of Southern winter oats and harvested in June the following year 17 bushels of fine oats. That fall two acres were sown on equally good or better land and not a quart was harvested. It is said there is no effect without a cause; probably the cause of this difference in results was the difference in seasons. The first being a mild winter and the latter a cold one. If there was any moral at all to this experiment it may be to sow no winter oats in this latitude.

LIME AS A MANURE.

B. R., BROAD FORD, PA.—There have lately been several inquiries and a number of articles published in the RURAL in regard to lime as a fertilizer, and the conclusions of all are altogether different from the results of my experience as well as of every farmer in Fayette and Westmoreland counties who has used lime on his land. There have been millions of bushels of lime used in these two counties the last 60 years and there is more used each succeeding year. I have myself burned 50,000 bushels in less than 20 years, and, instead of lime enriching the father and impoverishing the son, all my experience and every other farmer's here is just the contrary. As to putting sufficient on land to do the best it is expensive even where limestone is handy and fuel cheap, and it fails to do the best until 10 years after it is put on. Though its effect on small grain and grass is immediate it shows most and does the best for wheat and clover. I have by the use of lime alone raised 20 bushels of wheat per acre on land that before applying it produced only from three to five bushels, and land that at its best produced 20 bushels, after liming produced 30 bushels per acre. People here who use lime put on from 300 to 1,000 bushels to the acre, which at five cents per bushel, is quite expensive at first, but it will last for thirty years when enough is put on.

The way we burn lime here is to select as level a site as we can, and put a double layer of dry wood (old rails are the best) all laid the same way, then a layer of coal, then a thin layer of limestone, then a heavy layer of coal, and a heavy layer of limestone, and after this lighter layers of coal alternately to the top. The larger the kiln the less the cost per bushel, as two kilns of 5,000 bushels each, will take one-third more coal than one of 10,000 bushels. It is generally hauled out as soon as it is cool enough, which is a most disagreeable job, particularly on a hot or windy day. It is put in piles until it rains (never covered) when it is evenly spread. A better way is to burn the lime a year before using, and scatter direct from the wagon; it is just as effective and a great deal pleasanter way. I can raise more wheat by the use of lime alone than by the use of the best manure. Our best land is limestone clay, while the lime is in the ground naturally. I can't see why it is not just as good put there artificially. We have land here (limestone clay) that has been farmed for 100 years without any manure, that produces as well as it did 50 years ago. Put a heavy coat of manure on land and in five years the land will lose all the effect of the manure and be as poor as before. If you still keep on farming the land without any manure it will be poorer; does that prove that the manure impoverished the soil? If lime is useless on land, what fools the farmers must be! But they don't care whether it has any plant food or not so long as it makes things grow. I think there are more things in nature than are dreamed of by theoretical, not scientific farmers.

CARE OF MANURE.

H. N., LINCOLN, ILL.—F. M., South Bend, Indiana, asks in the R. N.-Y. of February 23, how to keep horse manure from burning. The answer is that thoroughly saturating it with water and compressing it will keep it from burning. How this is best accomplished is what I want to point out. The ground where it is intended to pile the manure, should be nearly level, (for although it takes a good deal of water to keep horse manure from burning, it should not be placed in a hole or depression where water can collect) make the piles about nine feet or more wide and as long as the manure will go or the room permit. Build the pile as nearly straight upon the sides as you can, and every layer of one foot or less must receive a thorough sprinkling with water and be tramped as in building a hotbed. After the pile is as high as desired and heat rises, the tramping must be repeated for a few days until the pile appears solid. There it is to be left undisturbed till wanted. If a good rain strikes it, so much the better, as the manure will absorb all that falls on top of it if the pile is flat. It should be arranged conveniently for getting the water there. Putting barrels on the wagon and throwing the water over the pile with a pail, did not prove satisfactory to me, as the work will often be neglected until one or more days' haulings have accumulated; then the water will not soak through and the lower part will fire-fang and spoil. The better way is, if a well is not by the manure already, to have one dug for the purpose with a good force pump in it. A tank or a lot of oil barrels should be prepared for the water and stand a little higher than the pile is going to be, and there should be a rubber hose of sufficient length with spraying nozzle attached to it. Do not think this will entail too much expense or labor, for if the manure is worth hauling, it is certainly worth preserving, and the more carefully and thoroughly this is done, the better satisfaction will be given. There is a difference between heating and fire-fanging. I want manure to heat to a considerable extent in order to destroy grass seeds contained in it and to hasten decomposition. Horse manure treated as above, is the best covering and mulch for strawberries that I can find. As to swine, I think they are entirely out of place on a large pile of heating horse manure; they like to lie on it, but they generally take cold from it and it is the worst place for them to lie down. Rooting it over and exposing it to the air is of no benefit to the manure. Where small quantities of manure are thrown out daily or weekly, cattle tramping and lying down on it will preserve it in the best manner. I compost nearly all the manure I use and do not spread or pile any on land that I want to plow early in spring, until the ground is dry enough to plow; then having the manure at hand and in good condition, a man can spread half an acre and plow it the same day. If the manure is spread in winter, it may be better for the land, but it keeps the latter wet or heavy too long in spring and renders it unfit for early gardening. At least this is the case with my soil unless the manure has been perfectly rotten.

MORE ABOUT "GRAIN HAY".

R. A. S., JOSEPH, OREGON.—A writer in a recent RURAL wants to know more about our practice of feeding grain hay. I will try and tell him how we do out here. Wheat and oats mixed make the best. Some sow wheat, oats and barley. I don't like barley mixed with wheat and oats, as it ripens much earlier. We sow a bushel of wheat and a bushel of oats. The proper time to cut grain hay is when it is in bloom. If I cut with a mower I let it lie in the swath until it wilts a very little, then cock it up in big cocks and let it cure One will have to use his own judgment about curing it. Out here we always have dry weather in harvest and can put hay up green and it will cure in the cock. The best way to cut grain hay is with a self-rake reaper or binder; then it is free from dust. Some bind their hay the same as grain; it is much more easily handled and doesn't occupy so much room in the barn. "Is it enough better than Timothy to be worth the price of straw and grain in the Eastern market?" For milch cows I think it is better feed, but the greatest advantage it has over Timothy is that it will grow on land on which Timothy won't, and I think it will make a third more hay than Timothy on the same land. Then again, where grain lodges, a man can make it into hay and derive a profit, whereas if he let it lie it would not amount to much. For horse feed I would let the grain stand until the head got in the milk for all kinds of farm work. A man can work a team without any other feed by giving them time to eat what they want at noon. A person must feed grain very sparingly when he feeds grain hay that has stood until it got in the milk. Any kind of grain will make good hay. The only difference between hay for cattle and horses is that it should be cut earlier for cattle. Stock of any kind don't like rye hay as well as the other kinds of grain hay, but if they are fed no other kind they eat it well and do well on it. A lady was telling me last spring that her cows never gave so much milk when fed on any hay as they did when they were fed on rye hay. Last fall I had grain hay for my team. The days were short and I plowed a little over three acres of land a day. I fed with the hay two quarts of chop barley and bran mixed half and half. I never had a team do so much hard work and keep up as they did. I am now feeding Timothy and clover mixed, I don't like it as well as the grain hay.

ABOUT THE NATIONAL POTATO CONTEST.

E. A. F., HANCOCK, VT.—In the RURAL of March 2, on reading the editorial allusion to the Women's Potato Contest, I notice this question. Is it fair to award premiums to those who raise the largest yield of potatoes at the least cost? I am somewhat confused. I don't just understand the object of this potato contest. I supposed to raise the largest yield at the least expense was just what we were to work for. Is the object of this contest merely to induce us to spend all we can on a few hills of potatoes solely with the idea of getting a prize, or, perhaps, the name of raising the most potatoes, regardless of the expense? If so, I, for one, have been laboring under a false idea of its purpose. I supposed it to be for the life-long good of potato culture. Again, how many women, do you suppose, have sent in their names who will not have any fertilizer or any money to buy it with, and who will have to depend entirely on barn manures? I live on a hill farm and don't expect a pound of fertilizer—only what I can manufacture myself; but I intend to try to raise potatoes just the same. As to the committee, I should prefer those most competent without regard to sex.

R. N.-Y.—The above reasoning is perfectly sound from our friend's standpoint. The R. N.-Y. respectfully submits the following: Here is a contestant who plants her potatoes in virgin soil, or in a soil rendered *excessively rich* by previous treatment. The cost, in *such a case*, will be nothing at all for manure or fertilizer and she will have a decided and unfair advantage over the many who will plant in comparatively poor soils. If the "least-cost" clause is to remain in, the latter class of contestants are virtually ruled out.

AS TO COW-PEA HAY.

F. C. F., MOBILE, ALA.—I have raised hay from cow-peas for the last 15 years and think there is nothing better for stock of all kinds. My method of preparing the land and sowing is as follows: After the spring crop has been taken off (about April or May) I replow, although I have broken up sod land and sowed right on top and got a full stand. I sow from 1¼ to 1½ bushel to the acre broadcast and harrow in. I cut the peas as soon as they begin to bloom or are making runners, that being the best time as far as my experience goes. Then one gets all the leaves, which I consider the most valuable part, but if one leaves them to run and mat together the leaves will all be lost in curing. The stems remain and are too hard and woody, and unless they are cut up with a cutter and fed with ground feed, they would not be relished by stock. I cut the peas with a mower or by hand in the morning as soon as the dew is off, rake them in windrows in the evening, and finish curing them in cocks. Some people throw the vines on racks in the field to finish curing, but where these are not handy my plan is very good. They will then retain their bright and green color and be eagerly eaten by all stock. If peas are allowed to run and mat over the ground, as suggested by H. L. Wysor, in the first place they could not be cut with a mower and it would require more than three times the amount of labor to cut them by hand, to say nothing of the loss already stated. The peas that we generally get are somewhat mixed—Black Clay and Whippoorwill—but any of them is good unless two crops on one plot in a season are wanted; then I would prefer the last though this holds good only in this latitude I believe.

BINDING-TWINE TRUST.

H. BROS., WHEATLAND, DAK.—I noticed an article in the R. N.-Y. of March 23, on this matter. We farmers of the North west are greatly interested in the subject of twine. On March 20, a farmers' meeting was called to discuss the question in Casselton, Dak. I never before saw such a large assembly of farmers to discuss their interests. It was shown that flax could be grown successfully here, but as there were none present who could give any information as to the manufacturing of twine from flax, a committee was appointed to investigate the matter, and report at the call of the chairman of the meeting. The subject of headers was debated and it was proved that we could buy headers to cut our grain for less than the twine would cost us at present prices. The advisability of starting a factory for the purpose of manufacturing twine from flax at some point in the Red River Valley was discussed, and also an oil mill. With starch and sugar factories, of course, we cannot do anything, but we are going to grow the flax this season and many farmers said they would plant from 10 to 100 acres. The latest Trust is among the jobbers: they have all combined and their traveling men will take orders from merchants but give no prices; these are to be fixed to suit themselves, when the orders get to headquarters. We think it is about time some legislation should protect farmers.

WOOL WASTE AS BEDDING FOR STOCK.

M. M., MEDWAY, MASS.—In a late RURAL an inquirer asks whether wool waste is good for bedding cattle, and the reply is "Yes, excellent." I beg to differ. I used large quantities of it at one time, taking the waste of a factory for three years. I looked at it, thought it would make good bedding and tried it, but it would not keep cattle clean. It was very far from clean itself, and it would adhere to the cattle, and it does not absorb much liquid on account of its oily character. It will heat, however, and the odor exhaled is enough to condemn it for use about the stable. In fact it is unbearable. In my reading I found advice to rot it down before using it for manure, and I tried that, but was not pleased with the results. The product, with the addition of ground bone and muriate of potash, made good manure, but very much of its value appeared to have been lost, though I kept the rotting pile well covered with loam. I could only surmise that free nitrogen had escaped during the heating process. A great waste there certainly was in some way. I have found the best results in my own practice, by spreading the waste broadcast on the ground and plowing it in. The bone and potash can be applied and harrowed in the surface. Used in this way, the results were excellent for grass. I have seen much of it used by other parties and if it is used in this way it gives by far the best results.

LIME FOR THE CABBAGE ROOT WORM.

T. H. HOSKINS, NEWPORT, VT.—Lawyers, as a rule, avoid proving too much. They make their points good with evidence (when they can) and rest there. In horticulture, it is pretty safe to say that evidence may prove so much as to be quite worthless; and it looks to me as if that were the case with Mr. Beckwith's experiment, as reported by E. S. Goff, of the Geneva Experiment Station in the RURAL, p. 181. If the test made "seemed" to show that the presence of lime in the soil about cab-

bage plants doubled the number of attacking root maggots, it might also seem to have been wiser to try the experiment over again—before sliding into print with it, in antagonism to the life long experience of such veteran gardeners as Peter Henderson, for instance, who says—in "Gardening For Profit," p. 137.—"The large amount of lime in the soil is not only congenial to the growth of the cabbage tribe, but is certainly destructive to the larvæ of the insect." The experience of others, on lands not naturally rich in shell lime, (such as Mr. Henderson recommends for cabbages) is that while its application does not at first destroy all the worms, and perhaps may produce but little effect, yet in the long run it does greatly diminish the number, so that good crops are grown where before they utterly failed.

A MISTAKE CORRECTED.

L. S. F., OAKLAND, IND.—In the RURAL of March 2, page 146, it is said that the bonded railroad debt of Muhlenberg county, Indiana, has been allowed to grow until it has reached $1,000,000, and that efforts are being made to repudiate it. This statement must be a mistake. There is in the State no county so heavily afflicted with debt, and none that would try to evade its legitimate debts; nor is there in the State any county called Muhlenberg.

R. N.-Y.—A telegram making the statement appeared in several New York dailies on February 21 and 22, just before the RURAL of March 2 went to press. No doubt Indiana was substituted by mistake for Kentucky, in which State there is a Muhlenberg county. We commented on the matter, believing the statements as to the fact and the place correct, without finding out whether among the 92 counties in Indiana, one was not called Muhlenberg. We are glad to learn that none of the counties in the fine old Hoosier State is so grievously debt-laden, and also that her sons have such a just pride in the honesty and solvency of all parts of their State as to be ready to correct promptly even an unintentional error reflecting upon her.

KEEPING HORSE MANURE FROM BURNING

R. B, ST. HENRY OF MONTREAL, CANADA.—In a late number of the RURAL, I saw an inquiry of how to prevent horse manure from getting fire-fanged. We draw the manure from 80 horses from the city. In beginning the manure pile, we give plenty of room, and as the loads arrive from the town we keep driving over the heap, spreading each load not more than six inches thick. We also had a basin-shaped hole in rear of the barn lined with puddled clay which received the urine from the stables and leakage from the barnyard. We put the horse manure from the city into this basin, and it absorbed all the liquid, making manure of the best quality.

We used the former plan when the basin got full and could not contain any more manure. The continual driving over the heap packed it so tight that it kept the manure from getting fire-fanged.

We get all the manure we want for nothing, and have to draw it three miles; our unleached hard wood ashes cost us $5.50 per ton delivered.

A LANGSHAN-COCHIN CROSS.

H. G., HAMBURGH, CONN.—After seeing the picture and reading the account of the RURAL'S Wyandotte-Dorking pullets in a late issue, I venture to give the result of a similar experiment I tried last spring in crossing a flock of Langshan hens with a Buff Cochin cockerel. The pullets, like the RURAL'S, vary very much in color; two have a complete mixture of black and brown feathers, while some are nearly all brown with spangled necks of black, while others have black feathers over their bodies with brown necks. All have fine plump bodies of as good form, I think, as that of the specimen shown in the RURAL, and they have fewer feathers upon the legs than the parents on either side. They were hatched about the middle of May; but did not commence laying until the last of December; but they have laid very well since then. Their eggs are very large for pullets and all are of the shape and color of those of the Cochin.

BURPEE'S GREEK WINTER ONION.

G. H. S., NORTHFIELD COUNTY, VA.—Last year I planted a packet of Burpee's Greek Winter onion, and was well pleased with the size of the bulbs, but a large percentage were scallions. This may have been owing to the soil—a rather heavy loam. At this date not one of them shows the least sign of sprouting, while Wethersfield and Danvers, with hardly an exception, have made sprouts from half an inch to four inches long. All received the same treatment. If the scallions can be eradicated I am inclined to think that Burpee's will prove a good onion for this section.

E. L., PHILADELPHIA, PA.—The criticism on calling the new American seedling rose by a French name—"Souvenir de Wootton"—in a late RURAL, is, on general principles, correct; but in justice to the originator—Mr. John Cook, of Baltimore—it should be stated that it was named and offered for sale under the name of Souvenir of Wootton. True, souvenir is a French word, but it is a word in everyday use, so much so that it has become part of our own language. The name, as it now stands, is much better than if it were known as "In remembrance of a pleasant afternoon spent at Wootton." The originator of an improved variety of fruit, vegetable or flower is entitled to some latitude when giving it a name. There is a little history connected with the naming of the rose under consideration, which may be interesting. "Wootton" is the country home of Mr. George W. Childs, proprietor of the Philadelphia Public Ledger. It is located at Bryn Mawr, Montgomery county, Pa., six or eight miles from Broad street Station, Philadelphia, on the main line of the Pennsylvania railroad. In August, 1886, the Society of American Florists was in convention in this city. Mr. Childs invited that body to his beautiful place to accept of his hospitality which was dispensed with a lavish hand and generous spirit. Mr. Cook, in his desire to return thanks to Mr. Childs, named the rose as above. When the rose becomes more widely cultivated and better known, the Souvenir de or of, will be dropped and it will be known by its more distinctive name "Wootton." The rose belongs to that class known as the Hybrid Tea. It is the result of a cross between the Tea rose Bon Silene and the H R. Louis Van Houtte. From present indications it will be more valuable to the grower of cut roses for commercial purposes in winter, than for the amateur to grow out of doors in summer. It may, however, prove as hardy as La France or any of the same type. It is more the color of Papa Gontier than the Jacqueminot, as it does not possess the velvety sheen which is one of the charms of the old and well-known "Jacque." It is large and double, and it is certainly one of the most promising varieties for cut flowers that has been tried in recent years.

S. S. C., FREDONIA, N. Y.—The RURAL of January 19th, referring to "Farmer's Institutes," and an article by Mr. Hodgeman on page 35, says, "Is he right in his guess that the managers of the New York State meeting are trying to heat the mass from the top?" Let us do justice to the present series of meetings. I attended the institute at Sherman, Chautauqua county, in December. Recently one was held at Fredonia. I think they were of great utility. They were both of them every whit as good as the institute described by Mr. Hodgeman. There is nothing in this world beyond improvement; but the meetings were a pronounced success—instructive, interesting, stimulative, helpful. This is the universal verdict of the farmers. Never before did I see professional men and others, not farmers, show so much interest. Believe me, if the two institutes in Chautauqua county, are samples, the money appropriated by the legislature will bring fourfold returns.

H.T., BRANDYWINE SUMMIT, DELAWARE CO., PA.—1. The corn that I have been growing for several years is a mixture of Gourd-seed and shallow-grain varieties, my aim being to get a large long cob and deep grain. By planting a mixed corn I think the blossoming period is lengthened, giving the pollen a better chance to fertilize the ears and making them fill better. 2. My yield, on an average, is about 75 bushels per acre without manure. I have grown 106 bushels on a measured acre with stable manure. 3. Four feet each way. 4. Stable manure and good bone superphosphate.

E. A. B., HOPKINS, MINN.—Of the vines grown from Niagara grape seed received from the RURAL one has survived. Last year it bore one imperfect bunch—white with a slight tinge of yellow—ripened with or a little before the Concord and was about the size and shape of the Lady.

What Others Say.

THE Albany Cultivator and Country Gentleman offers in a pithy way suggestions as to the construction of silos that shall really cover the entire subject.

SILOS should be made deep or high when practicable, so that the silage itself may exert a greater pressure on all below. * * Good walls may be made of boards or plank, nailed on the two sides of a stiff timber frame forming an air-space lined with tarred building paper, to make it air-tight and prevent freezing much. * * If the planks are well soaked with petroleum, they will last many years. The portion next to the earth may be treated with gas tar. * * A plank door, capable of being strongly barred, should open next to the passage towards the stable. * * The bottom or floor should have perfect drainage. * * After filling the silo, during successive days, the contents will settle in the course of a week or two, to about two-thirds of their former bulk. * * A ton of good silage contains no more nutriment than an equal amount of well dried and cut cornstalks, but it is liked better by cattle and is better assimilated, digested, and goes further than the dry fodder. * * It has nearly the same advantages as green food given in summer. * * The best silage is obtained by allowing the stalks to ripen enough to let the grain glaze, and the leaves to dry on their edges. Failure results when cutting too green. * * Thoroughly tramp around the edges of the silo in filling; the central portion will become solid without much tramping. * * Weighting the silo packs the top layer more nearly air-tight; leaving it exposed causes several inches to rot on the top. A layer of several inches of dry straw holds a portion of the steam from the hot silage and tends to lessen the rotting. * * A weight of a hundred pounds to the square foot is ample It may be stones laid on plank cover; or it may be sand, saw-dust, earth or bags of grain, according to convenience. Weights are better than screws, because continuous. * * In feeding out, expose as little of the silage to the air as convenient, either by cutting down perpendicularly in successive sections; or in small silos with large herds, by taking off successive layers over the whole surface. * *

MANAGEMENT OF CREAM.—The all-important question that was asked John Gould at the institutes was, "How can I keep cream to get enough to churn and not have it get old or musty?" Milk and cream, Mr. Gould says, in the Weekly Press, will take up everything afloat but fine flavor. The best remedy is a creamer. Keep the cream sweet and cold by allowing the pail to remain in the cold water. When ready to churn bring out the cream, warm it up to 64 or 65 degrees and keep it there until properly ripe or pleasantly acid, or bring it up at once to 75 degrees and let it cool down slowly to 64 degrees or thereabouts and churn as it gets acid. The chief trouble, and the one that gives the most bother, is in allowing cream to remain in a room of changing temperature, from freezing up to "blood heat," as many a room is where cream is set to await churning. Keep it cool at a uniform and low temperature. Don't try to keep it too long even then. Better add 30 per cent. of water at 64 degrees and churn the oftener. Never add "fresh" cream to old just as you start to churn. The acid of the old cream will not "cut" the new quickly enough to liberate all the globules, and a large per cent. will remain unchurned and will go out in the butter-milk, which also decreases the profits of dairying.

WORTH NOTING.

IT is useless for any one to attempt to make a small farm pay, unless he has a love for his work, remarked a speaker at a late farmers' meeting, as reported in the Massachusetts Ploughman. If he has a genuine love for it, everything he puts his hand to seems to know it. If his specialty is plant growth, whether fruit, vegetable or cereals, it is astonishing to his neighbor how they grow. If it is animals, they feel his love and how they grow and thrive. But if, on the other hand, he has no special love or liking for his work, plants and animals seem to know it, and they don't like him and fail to respond to his heartless labors.

A FARMER must be a student and abreast with the progress of the times. In brief, the qualities necessary to the make-up of a successful farmer are as follows: he must be active, diligent, methodical, economical, temperate, progressive, a good salesman, and possess a good share of common sense. If he is not blessed with these qualities, the sooner he sells out and gets into something else the better; for it will avail him nothing to remain and make himself uncomfortable and everybody else by whining and moaning that farming is a poor business and cannot be made to pay.....

THE corn plant cannot endure a crusted soil about it.....

IF, by some unforeseen accident every other grain crop, every root crop, and all our grass and other fodder crops were lost to us, we could still survive and prosper if only corn were spared.....

THE florists of the country are trying to settle upon a national flower. The R. N.-Y. would select Zea mays. This would no doubt amaze the ladies and corner the florists.....

IF it be granted that the application of 1,000 pounds of a $50 fertilizer will increase the yield from 25 to 50 bushels, then that amount can be profitably applied.....

NOTHING will keep the young corn plants thrifty and keep them growing better than stirring the soil.....

PROF. HENRY says, in the Breeder's Gazette, that a principal reason why farmers have held to the silo is because their stock show such an intense fondness for silage after having been fed upon it a few weeks. Every good feeder learns to appreciate the discriminating appetite of his cattle and is happy in catering to it, believing that any preference expressed by the beast should be carefully considered by the master. There is no denying that horses, cows, steers, and sheep prefer some of this succulent food to anything that can be given them excepting grain and roots, and will leave the best hay that can be made, for plain fodder-corn silage. So long as the facts stand thus those who have had actual experience will not permit themselves to be argued out of the case by persons who have had no experience in the matter. They propose to stand by the beasts that have the food to eat, rather than by neighbors who theorize about it. It is an undeniable fact that the friends of the silo today are the *owners* of silos, and that the objections to it come almost wholly from persons who have never fed a pound of silage in their lives. It will be ample time for us to grow doubtful in the mattrr when we see siloists giving up the practice.....

THE new tuber-bearing plant called Stachys tuberifera is prized in France. The tubers with us at this season are rotting when kept in damp sand, while if brought into a warm room they shrink up immediately into a mere skin. The plant is said to be hardy .....

MR. W. W. RAWSON says that the best cultivators do well if they succeed with cauliflowers three seasons out of four. Failures are generally caused by drought.....

MR. PHILBRICK of the Massachusetts Horticultural Society, plants squash seeds among his early potatoes. The squash vines do not ordinarily interfere with the potato vines until the latter have made their growth.....

MR. PHILBRICK commends the White Egg as the best turnip for family use. This variety may follow a crop of peas if the land is rich..

JUST before frost Mr. M. B. Faxon takes up his tomato plants with all the soil that can be made to adhere to the roots, and places them in the cellar. He has had perfect, well ripened tomatoes on his table as late as Thanksgiving from such vines.....

MR. FAXON speaks well of the Sieva dwarf bean. This variety is really a small Lima....

PLANT some beet seeds for greens. Is your parsnip seed sown?.....

THE following is taken from our old and much respected friend the Farm Journal:

"DEAR FARM JOURNAL: Would you not, as friend and guardian of the farmer, do us the favor to call on the RURAL NEW-YORKER, and try to induce it to call a halt, and think what it is doing to us poor farmers who happen to be potato growers? For the last seven years or so it has been teaching the world to raise such enormous crops of potatoes that the price has whittled down, so that to-day they only bring the Pennsylvania farmer about 20 cents per bushel. And now, to cap the climax of our misery, it is trying to induce all the fair ladies of the land to go into potato culture next spring, for health and for profit. Should this prove a success, what will potatoes be worth a twelvemonth hence? Probably not more than five cents per bushel. And the R. N.-Y. in its next cartoon will be obliged to add to the load of the over-burdened farmer, a bouncing, healthy, robust woman or two, on his shoulders, carrying large sacks of potatoes to market. The last straw broke the camel's back.
Hydetown, Pa. DESPAIRING FARMER."

PROF. HENRY says, in the Farmers' Review, that the best way to treat sorghum is to plant eight or ten seeds in hills two feet apart, with the rows three or three and one-half feet wide. Plant about the same time as corn, but not until the ground has become warm, upon well prepared, freshly stirred soil. He has been able to grow cane with very little hand cultivation, by having the ground carefully prepared and using a fine slant-tooth drag to stir the soil before the seeds have sprouted, and while the plants are small. If the hills are slightly below the general surface the drag will not tear much of the cane. Usually cane must be hoed once or twice, since the young plants are quite small when they first spring up, and easily smothered by weeds. The after cultivation can be carried on with the cultivator.....

PROF. FERNALD shows us that alum water—even a saturated solution—has little or no effect upon the currant worm.....

WALDO F. BROWN offers a sensible suggestion in the Farmers' Review. It is that the end posts, which must bear the strain of stretching the wires, be set with concrete. It will take but a few cents' worth of cement to a post, and will make it perfectly firm at the bottom, and also more durable than if set in the clay. It is almost impossible to set posts firm enough so that they will not yield to the strain when the land is wet and soft, but by digging a hole fifteen inches square and pounding it full of coarse cement grout around the post it will give base enough to the post to keep it in place.....

BEFORE the meeting of the Market Gardeners' Association, as reported in the Massachusetts Ploughman, Mr. Crosby remarked that system is needed upon our farms; some farmers now work their men only 10 hours per day, others still demand 15 hours; when we can offer our men the same wages for the same hours that are offered by other trades, and a steady job by the year, we will be able to get as good men as ever, and as many as we want, and we shall also be likely to keep more of our young men upon the farm. If the farmer demands 13 hours of labor for the same pay that is given for the 10 hours in other trades, then farming must be a poor business; so say the young men and the laborers, and this is why we cannot keep them.....

HE further said that Messrs. Budlong & Son, of Providence, R. I., the largest market gardeners in New England, work their men only 10 hours per day. If it is necessary to get the men out at 5 A. M., give them two hours at noon or quit at 5 P. M. or give them better pay.....

A GOOD man who works with a will and has his employer's interest at heart can earn as much in 10 hours as an indifferent or careless man in 13 hours and in order to get the best service we must use our men well and secure their good-will.....

A MEMBER was asked what were his objections to a wooden silo. He replied that rats were liable to destroy it. One member estimated that it would require 12 tons of silage a year for each cow—about a ton a month.....

THE silage has kept better in the silos made from lumber than in those of concrete. Mr. Bullard says that they feed twice a day regularly, morning and evening. In addition to this the cows get, morning and evening, mixed with the silage, three or four quarts of grain. The grain that satisfies best is made up of half bran, one-fourth chop, and one-fourth oil-meal. For cream and milk it gives the best results.....

LAST March (1888) 100 prominent men of Wisconsin were written to who had built and tested silos. All expressed themselves in favor of the silo and satisfied with their success in raising the fodder and feeding the silage. No less than 2000 silos, as the R. N.-Y. has noted, were built in Wisconsin last year.....

MR. J. J. H. GREGORY, before the same meeting, said that he had used three manure spreaders and found them very useful tools. They have been much improved of late. The Meeker harrow was also a very useful tool; he used it in preparing land for small seeds, and estimated it saved him the labor of 18 men with rakes in preparing land for onions. It will not work well on land that has many stones as large as the fist, but on good loamy land is invaluable. For spreading fertilizers in the drill and mixing with the soil he used the Spangler Spreader, and a machine made at Taunton for broadcast spreading of fertilizers. This machine drops the fertilizer so near the ground that it does not get blown away by the wind.....

Mr. GREGORY stated that the manure spreader would put on about four cords per acre at one application. If more than this was needed he applied fertilizers. Mr. Sullivan said the Meeker harrow did not work well on the stiff soil of Revere. Mr. Rawson said he had discontinued using a manure spreader because he could not apply enough at one application and in going over a second time the wheels would clog. He preferred to use two carts. He used the Meeker harrow and liked it for sowing fall spinach on ridges. He also used it somewhat in spring. It is a good tool. He preferred the Cutaway harrow to the Acme; it clogs less and will work on sod. Mr. Gregory said the Kemp manure spreader will work any manure except long straw fresh from the stable. Brick-bats do not generally clog it, but sometimes are thrown at the driver by the machine. He had spread 65 loads in a day with two spreaders and a man to help load.

Mr. James Russell said this machine works well and will spread anywhere except down a steep hill. The improved machine will apply 12 cords per acre by lapping half way.....

PROF. HENRY, of the Wisconsin Agricultural Experiment Station, says experiment silos open in a very satisfactory manner this year, and some of the silage shows only a trace of acid. The first crop of clover silage was very satisfactory and he thinks more interest will be taken in it in the future. The feeding experiments are not yet far enough along to warrant much being said regarding them, but thus far they have got rather more milk and more butter by several per cent. from ensilage than from fodder, although the fodder is unusally fine. He sees nothing wrong with the milk, or its keeping qualities, whether from silage or fodder.....

DIRECT.

——PETER HENDERSON: "Above all, be careful not to to attempt the cultivation of more land than your capital and experience can properly manage. More men are stranded, both on the farm and garden, in attempting to cultivate too much, perhaps, than from any other cause."

——"THE dried peat moss, now being used in the cities for bedding, is likely to be of great value to the market gardener, if it can only be had in sufficient quantities. We have had it in use in our own stables for about a year and find it not only more economical than straw for bedding, but its absorbing qualities make it of great value for fertilizing purposes."

——MASSACHUSETTS PLOUGHMAN: "One of the surest roads to success on a small farm is promptness. I know of nothing that causes more failures than the want of it."

——"MANY think the sons must remain on the farm. I have only one son, and he is not adapted to farming. I don't want him to stay on the farm, for I don't think he is adapted to the farm. Some boys do not like farming and they will not succeed."

——"I HAVE been an overseer of the poor at Peabody for 35 years and not a single farmer has ever crossed the threshold of the Poorhouse."

"GIVE fools their gold, and knaves their power;
Let fortune's bubbles rise and fall;
Who sows a field, or trains a flower,
Or plants a tree, is more than all"

——HUSBANDMAN: "If the new Secretary of Agriculture wants to get very close to the people his Department is intended to represent he cannot do better than to call to his aid men who have made farming their chief business and tried to elevate the industry by securing for it the recognition it deserves as a most honorable calling."

——"A MAN who has a business capable of yielding 20 per cent. annual profit and has 20 per cent. of mistakes to correct in its management may look for great egress through the little end of the horn, so to speak."

——COL. F. D. CURTIS: "Give the hog some show. Pigs always kept in a pig-pen are not healthy food, and the man who eats them eats his own pig-pen."

——N. W. AGRICULTURIST: "If farming does not pay it is easier to put enough energy and brain work into it to make it pay than to enter upon the fierce struggle for life that is going on in all cities. There are nine chances to win on a farm to one in a city."

Horsford's Acid Phosphate,
Beware of Imitations.—*Adv.*

Miscellaneous Advertising.

Scrofula

Probably no form of disease is so generally distributed among our whole population as scrofula. Almost every individual has this latent poison coursing his veins. The terrible sufferings endured by those afflicted with scrofulous sores cannot be understood by others, and their gratitude on finding a remedy that cures them, astonishes a well person. The wonderful power of

Hood's Sarsaparilla

in eradicating every form of Scrofula has been so clearly and fully demonstrated that it leaves no doubt that it is the greatest medical discovery of this generation. It is made by C. I. HOOD & CO., Lowell, Mass., and is sold by all druggists.

100 Doses One Dollar

MAKE HENS LAY

SHERIDAN'S CONDITION POWDER is absolutely pure and highly concentrated. It is strictly a medicine to be given with food. Nothing on earth will make hens lay like it. It cures chicken cholera and all diseases of hens. Illustrated book by mail free. Sold everywhere, or sent by mail for 25 cts. in stamps. 2½-lb. tin cans, $1; by mail, $1.20. Six cans by express, prepaid, for $5. I. S. Johnson & Co., P. O. Box 2118, Boston, Mass.

$20 FENCE MACHINE FOR $10
Freight paid. *Guaranteed.* Hundreds in use. Circulars free. S. H. Garrett, Mansfield, O.

THAT OFFER OF $5,000.

OUR readers will doubtless call to mind the offer so widely advertised for the past ten years by H. H. Warner & Co., the proprietors of Warner's Safe Cure and Warner's Log Cabin Remedies, that they would pay $5,000 to any person who would prove to an impartial referee that they had ever published a testimonial that was not genuine, so far as they knew.

This offer had the ring of honesty about it, and as the matter has an especial interest just now, we give a copy of the offer as it appears in the Messrs. H. H. Warner & Co.'s pamphlet:

AN OFFER OF $5,000.00.

Every Testimonial published by us is Bona-Fide, and, so far as we know, is absolutely true. To any one who will prove the contrary to an impartial referee we will give $5,000. *H. H. WARNER & CO.*

Rochester, N. Y., January 2, 1888.

We ask the reader's careful attention to the following testimonials, as bearing on the offer, and their unbiased opinion of the same with reference to the $5,000.

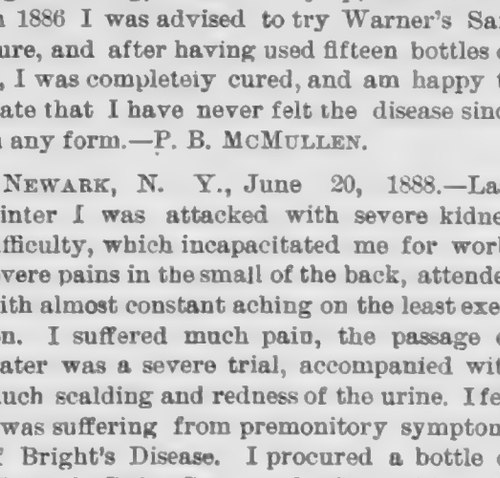
IOWA CITY, IA., June 30, 1888.—Some weeks since my daughter had a severe attack of Rheumatism. She was persuaded to take one bottle of Warner's Safe Cure, and one of Warner's Safe Rheumatic Cure, and has entirely recovered. We think it wonderful, as twice before she had been confined to her bed for months with it.—MRS. SYLVANUS JOHNSON.

CAMP VERDE, ARIZONA, Oct. 27, 1888.—For nearly a year I suffered from Gravel, and was under the treatment of a doctor. I took a great deal of medicine, but it all seemed to fail. I then began with Warner's Safe Cure, and after using one bottle of it began to get better; got another bottle, and took half of it. The gravel stone left me, and I began to mend. I am now feeling as well as I ever did in my life.—MRS. DOLLY MASON.

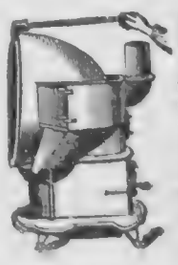
231 Myrtle Ave., BUFFALO, N. Y., November, 1888.—In 1866 I was attacked with kidney disease, and suffered for 20 years, applying often for advice to medical men of high standing, without any apparent relief. In 1886 I was advised to try Warner's Safe Cure, and after having used fifteen bottles of it, I was completely cured, and am happy to state that I have never felt the disease since in any form.—P. B. MCMULLEN.

NEWARK, N. Y., June 20, 1888.—Last winter I was attacked with severe kidney difficulty, which incapacitated me for work, severe pains in the small of the back, attended with almost constant aching on the least exertion. I suffered much pain, the passage of water was a severe trial, accompanied with much scalding and redness of the urine. I felt I was suffering from premonitory symptoms of Bright's Disease. I procured a bottle of Warner's Safe Cure, and after taking the first bottle I felt so much improved that I continued to take it to the extent of four bottles. I am now a new man, able to do a good hard days work, with no recurrence of any trouble with the kidneys.—MANDEVILLE W. PLASS.

There is no getting away from such testimony as the above. The offer is genuine. In fact, Messrs. H. H. Warner & Co. have always requested that doubters should write direct to persons giving testimonials, (enclosing stamp,) and who are of necessity, in the great majority of cases, totally unacquainted with the firm.

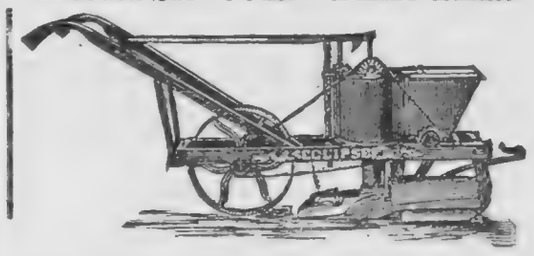


CHARMING NOVELTY.—Lamp shade in the form of Toy Buildings. Landscapes with illuminated cottages. Price, 12c. each; 10 shades, $1.25, $2; carriage free; payable in advance in stamps or money orders of any country. 100 shades, $4.50, including packing, taken at factory. In 8 days more than 10,000 were sold. H. KUMSS, Warmbrunn, Silesia, Germany.



PROFIT FARM BOILER!
With Dumping Caldron, empties its kettle in one minute. The simplest and best arrangement for cooking food for stock. Also make Dairy and Laundry Stoves, Water and Steam Jacket Kettles, Hog Scalders, Caldrons, Etc. Send for circulars.
D. R. SPERRY & CO.,
BATAVIA, ILL.

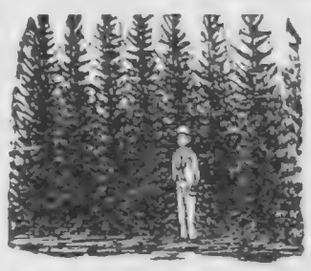
ECLIPSE CORN PLANTER.



Will plant Field and Ensilage Corn, Beans, Peas and Beet Seed in **hills, drills** and **checks**—in hills up to 45 inches; in checks from 36 inches up to any distance desired. Will disiribute all Fertilizers **wet** or **dry.** Farmers, send for circulars.
ECLIPSE CORN PLANTER CO.,
Enfield, Grafton Co., New Hampshire.

JOHN SAUL'S
Washington Nurseries.
OUR CATALOGUE OF
NEW, RARE AND BEAUTIFUL PLANTS
for 1889 will be ready in February. It contains list of all the most beautiful and Rare Greenhouse and Hothouse plants in cultivation as well as all novelties of merit well grown and at very low prices. Every plant lover should have a copy.
ORCHIDS.—A very large stock of choice East Indian, American, etc. Also Catalogue of Roses. Orchids, Trees, etc. All free to applicants.
JOHN SAUL, Washington, D. C.

379 VARIETIES OF FRUIT TREES, VINES, PLANTS ETC.
Apple, Pear, Peach, Cherry, Plum, Quince, Strawberry, Raspberry, Blackberry, Currants, Grapes, Gooseberries, &c. Send for Catalogue.
J. S. COLLINS, Moorestown, N. J.



FOREST TREES.
Catalpa Speciosa, White Ash, European Larch, Pines, Spruces, Arbor Vitæ, etc., etc.
Catalpa Speciosa Seed.
Forest and Evergreen Seeds.
R. DOUGLAS & SON,
Waukegan, Ill.

GROWERS AND DEALERS IN SWEET CORN, ATTENTION! Genuine Connecticut grown Stowell's Evergreen Sweet Corn by express, $2.25 per bushel, $1.25 per half bushel, 75c. peck.
C. E. CHAPMAN, Westbrook, Conn.

GRAPE VINES
Nectar, Woodruff, Eaton, and all the best varieties. Gandy and other Strawberries. Blackberries, Raspberries, Wonderful Peach, and other nursery stock.
Descriptive catalogue giving *Instructions for planting* free
JOEL HORNER & SON, Delair, Camden Co., N. J.

VEGETABLE PLANTS—Standard Sorts, at reliable rates. Send for Price List.
M. GARRAHAN, Kingston, Pa.

FOR SALE CHEAP!
3 and 4-Year-Old Apple Trees. List of Varieties and prices on application.
GRAY BROTHERS, New Canaan, Conn.

IT WILL PAY YOU
—BEFORE BUYING YOUR—
SEEDS

WM. ROBERTS, M. D., Physician to the Manchester, Eng., Infirmary and Lunatic Hospital, Professor of Medicine in Owen's College, says: "Gradual failure of strength, increased pallor or sallowness, and disinclination for exercise is one of the prominent symptoms of kidney disease." Warner's Safe Cure is the only remedy that is guaranteed to cure kidney disease.

THE
RURAL NEW-YORKER.
A National Journal for Country and Suburban Homes.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, New York.

SATURDAY, APRIL 13, 1889.

THE R. N.-Y. hybrid and crossbred wheats never looked so well as now at this season. The reasons are, first, that the little field is so graded that water does not stand in any part, and, second, the plants were carefully mulched with horse manure last fall after the soil was frozen.

"*Am I alone in saying that the first prize should go to the woman who gets the largest yield and does the most work with her own hands?*"—MRS. F. L. AVERY, page 248.

ATTENTION, friends of the Women's Potato Contest! Read the "Instructions" given on page 246 and save it for future reference. If the R. N.-Y. has not covered the entire subject in an acceptable way, suggestions are now in order. Next week a complete list of the names of the contestants will be printed.

"*By planting a mixed corn I think the blossoming period is lengthened, giving the pollen a better chance to fertilize the ears and making them fill better.*"—H. T., page 250.

A SMALL bag of peas was opened one day last week and found to be alive with the pea weevil. They were placed in a paper box six inches square, one tablespoonful of buhach was added, the lid put on and the box shaken. They were kept in this box for 48 hours and shaken three or four times during that time. All the weevils were killed. If all who sow peas or beans would treat them in the same way, the pea and bean weevil would soon disappear.

"*Allow me to congratulate you on the very handsome way you illustrated the feeding experiment of this college and to thank you for the elaborate notice you gave of it.*" EDWIN WILLITS, Director, Michigan (Experiment Station).

THIS is given as a Wisconsin agricultural rule, but there is no reason to suppose it will not work wherever land is tilled:

"When I think my field is running down and see the old parrot on top of the fence, I plow from eight to 10 inches deep in the fall, and in the spring I mix 14 pounds per acre of clover seed with wheat or barley and sow with a broadcast seeder. When the clover comes up the old parrot leaves. J. B.
Ripon, Wis."

"*From the day we began the work our health steadily improved. I think you deserve great credit and many thanks from delicate ladies, for thinking of the plan of the Contest, etc., to induce women to work out of doors more.*"—M. B. H., page 248.

HERE is a point raised by an Ohio subscriber, that our readers are requested to think over:

"Does the Inter-State Commerce Law benefit the average farmer? I shipped potatoes to a point situated on a Cincinnati and New Orleans road, not two-thirds of the distance to New Orleans from Cincinnati, and was charged the same rate as to New Orleans on the same road. The overcharge is about $100. My lawyer friend says we cannot afford to sue a railroad for that amount, and lawing is not in my line anyway. Is not this the common experience of farmers who use the railroads?"

"*The latest trust is among the jobbers, they have all combined and their traveling men will take orders from merchants but give no prices; these are to be fixed to suit themselves, when the orders get to headquarters. We think it is about time some legislation should protect farmers.*"—H. Bros., page 249.

OUR venerable friend Alfred Rose, of Penn Yan, upon receiving a letter from a New York law firm *in re* his claim that the R. N.-Y. potato No. 2 is one of his seedlings, displays some feeling in his reply. The firm among other questions asked: "Do you declare that the R. N.-Y. No. 2 is the same as your seedling?" Mr. Rose replied: "I do not. In the name of God what more do you want?"

In the face of this and previous declarations to the same effect, his potato pamphlet is being sent about the country. What is said of the No. 2 and his own seedling is cunningly worded so as to lead the reader to suppose them to be the same. But *he* does not say so.

"*As to swine, I think they are entirely out of place on a large pile of heating horse manure; they like to lie on it, but they generally take cold from it and it is the worst place for them to lie down. Rooting it over and exposing it to the air is of no benefit to the manure.*"—H. N., page 249.

THE NEXT SPECIAL of the R. N.-Y. will treat of *Hay and Haying Tools.*

The R. N.-Y. will be glad to have its readers send short answers to the following questions:

1. *What grasses are grown for hay in your part of the country? Do you favor early or late cutting? Why?*

2. *Give a list of improved haying tools in general use in your vicinity.*

3. *How often do you seed down? With what crops? What season?*

4. *What is the average yield per acre and what manure is used?*

5. *Any new grasses or substitutes tried recently? What success?*

6. *What in your opinion is the best way to increase the productiveness of our meadows?*

"*From the vantage point of the last half of an average life the experimental character of the world will be plainly discerned, which substantiates the triteness of the saying that our hind-sight is much better than our fore-sight, as during the first half of life we are quite apt to mistake mere surmises for actual truth.*"—A. T. T., Franklin Park, N. J., page 249.

UNDER "Discussion" a correspondent makes some statements showing how Western farmers regard the "Binding Twine Trust." It is evident that these farmers are in earnest. The injustice of those who seek to impose upon them has passed the limit of endurance. The R. N.-Y hopes something will come of the effort to manufacture twine from flax or some other western-raised material, and it believes that the plan can be carried out. The writer passed many a day in boyhood turning the wheel in an old New England rope-walk. Consequently he knows something about the economy of the manufacture of rope and twine on a small scale. Dakota farmers *can* make their own twine and defy the "Twine Trust." The R. N.-Y. ventures to say that there are plenty of men all through the West who were reared within sight of a "rope walk" and who can hatchel and spin if called upon to do so.

MILK dairymen near some of the larger towns and cities never raise their own cows. They buy cows in the full flush of milk, milk them until nearly dry and then sell them for about what they will bring as beef. Some farmers who have a good supply of hay and stalks buy these rejected cows and keep them until they calve and then sell them, perhaps to the very dairymen who owned them before. Several farmers living near the R. N.-Y. New Jersey farm have practiced this business for some years. It is a rather speculative business. The cow may or may not be in calf, she may prove a good milker or a poor one. The best that can be said of the practice is that it enables a farmer to speculate on a lot of fodder that would be worth but little in the market any way. The cost of raising a heifer calf increases as one comes nearer a large city. This fact, if nothing else, ought to show Eastern farmers the folly of trying to raise calves from poor cows.

THE seeds of Pyrethrum cinerariæfolium are now offered by nearly all seedsmen. As the R. N.-Y. informed its readers four years ago, these plants stand the winter without protection, give a profusion of bloom, while the colors vary from red, through rose to white, resembling large Oxe-eye daisies or White-weeds in form. They are really among our prettiest hardy herbaceous perennials. It may also be remembered that we tried a year or so later powder made from the flowers of the Oxe-eye daisy (Chrysanthemum—Leucanthemum—vulgare) thinking possibly that it would have the same effect on insects. It had no effect at all upon them.

It is an interesting fact that while the ground flowers of pyrethrum have such a remarkable effect in paralyzing many kinds of insects, the flowers while intact upon the plants are visited by insects the same as other flowers, without, in so far as the writer could discover, causing them any injury.

THE director of one of the Western Experiment Stations sends a rather pompous announcement in which he informs the R. N.-Y. that he proposes to send all his bulletins free of charge. Then he goes on to say:

"It would afford me still greater gratification were you to reciprocate by admitting the Station to your list of exchanges and assure us of the regular receipt of your publication. I may further say that the policy of this Station from now on, will be to subscribe only to journals of a special technical character and to none of those of a more general nature and circulation. We propose to issue monthly publications and believe they are equivalent in value to the majority of the weekly or monthly agricultural or family papers of the country."

The R. N.-Y. believes that these Stations are fully able to pay for their papers. They have a fund large enough to cover all such expenditures. There is no reason why any farm paper in the country should make any of them a present of a year's subscription.

LAST year an anti-oleo bill before the Massachusetts legislature providing that oleomargarine should not be colored in imitation of butter, was lost in the Senate, and earnest efforts were made at the last election to defeat enough of the opposing legislators to insure the passage of the measure this year. Just after the election it was supposed that this object had been attained, as several of the antagonists of the bill failed to secure a re-election. This reasonable expectation of the Bay State farmers has, however, been disappointed, as a similar bill introduced into the present State legislature was defeated by a tie-vote in the Senate the other day. The mishap was due mainly to the failure of the farmers of the State to impress their wishes in the matter forcibly on their representatives, though one or more of the latter proved shamelessly treacherous in violating the promises they had made before election. The "oleo" men found little difficulty in securing genuine or bogus signatures to numerous petitions against the bill in the towns and manufacturing villages; whereas the farmers were lax in obtaining signatures to counterbalancing petitions in favor of the measure. If farmers will not take pains to help themselves in legislative as in other matters, they can hardly hope for success, however just their demands.

SEVERAL of the agricultural papers express considerable dissatisfaction at the selection of S. S. Rockwood. Editor of the State Gazette, Portage City, Wisconsin, as "chief assistant" of the new Secretary of Agriculture, on the ground that he knows little or nothing of agricultural matters. These animadversions are, however, misplaced. Mr. Rockwood has been selected only as Chief Clerk of the Department. True, the Chief Clerk was the principal assistant of the Commissioner of Agriculture; but the law creating the office of Secretary of Agriculture at a salary of $8,000 a year, also provided for an Assistant Secretary at a salary of $4,500, who is to have the chief charge, under the Secretary, not of the clerical work, but of the agricultural business of the Department. After some delay, this office has been offered to Edwin Willits, President of the Michigan State Agricultural College, and the selection is generally regarded as eminently proper and gives widespread satisfaction. The present salary of President Willits is $2,000 a year together with a fine residence and other advantages. His position too is permanent and congenial, so that there was some doubt whether he would leave his pleasant Michigan home, to make a new one in Washington. He has, however, just accepted the position. The office of Assistant Secretary of Agriculture, should be permanent to a competent incumbent.

A METHOD TO PROTECT TREES FROM BORERS. TRY IT.

LAST year we briefly alluded to the simple method employed by our neighbor Augustus J. Hewlett, to protect his apple and peach trees against the borer. It has led to so many inquiries that it may be well perhaps to speak of the method more in detail. Fruit-growers all know that tarred-paper about the trunk is harmful to it. Laths, etc, tied about the trunks are not altogether satisfactory. Mr. Hewlett's mode reduces the labor and expense to a minimum and seems thoroughly efficacious, as he has practiced it for over 20 years. White lead and raw linseed are mixed as for ordinary outside painting, though a somewhat smaller proportion of the lead suffices. With this mix enough cheap mineral paint and lamp black to imitate closely the color of the bark. The young trees should be painted in the spring just as soon as transplanted and every year thereafter in early May. The paint is applied from a little below the soil to a foot above. In four or five years the bark will peel off after the paint has been applied. When this excoriation occurs, if before July, it is best to remove what bark still clings and at once give another coating of the paint. The new bark underneath will be found bright and healthy, showing that the paint does no harm. Mr. Hewlett painted some apple trees every spring for 15 years or more. The painting was discontinued for several years as he thought there might be no occasion for further painting. These trees however were at once attacked by borers and several were found six inches above the entrance. Peach trees are painted in the same way. He has never had a tree injured by borers if they were regularly painted.

Try Mr. Hewlett's method, friends. He is a careful, conservative farmer and his statements may be accepted as fully trustworthy.

"*It is not enough to say that the railways carry cheaper than teams and wagons can. Of course they do. That is just what these great inventions of the past enable them to do. It is, however, a curious fact illustrating this hidden fallacy of argument, that one of the first railways built in Iowa based its local rates upon the actual cost of wagon transportation on dirt roads, mud roads, usually in the then new country. This was an absurdity, an utter ignoring of the existence of steam engine and iron track as ideas then and agents belonging to society, to the world at large.*"—PRES'T W. I. CHAMBERLAIN, page 245.

BREVITIES.

READERS who have had experience with the "grain hay" noted in another column, are requested to write it out for the R. N.-Y.

THE Kentucky station confirms the R. N.-Y.'s conclusions as to the value of sulphate of iron as a fertilizer. Why not stop hinting at the mysterious fertilizing powers possessed by this substance.

A PICTURE of an Ohio farm-house will be printed next week. Readers of the R. N.-Y. will be greatly pleased with it. Such a house is a certain indication that farming pays and is made comfortable—indoors at least.

IF you want to make a good hired man feel discontented get him to do all the work of caring for the farm team and then drive the team yourself. The man who takes care of the team ought to drive it—that is, if you want the best work the team can do.

THE R. N.-Y. has just been shown an ornament for a woman's hat in which bright-colored bugs take the place of birds' heads. The wings of the bugs are colored and polished in a beautiful manner. This is a good idea. Some of our most injurious insects are the handsomest.

POULTRY people who complain that purchased eggs do not produce chicks true to the standard or that some breeders hold their eggs for higher prices than others do, are respectfully requested to try a breeding pen of their own and see how the chicks will vary in size, color and shape.

LAST fall the R. N.-Y. gave some facts regarding the profit of mulching winter wheat with straw. Quite a number of readers wrote at that time that they proposed to experiment with various sorts of mulching. The R. N.-Y. will be very glad to hear from all who have tested the matter.

MR. DAVENPORT writes us that instead of being surprised that varieties of potatoes are occasionally mixed by dealers, the wonder to him is that so many varieties are kept pure and true when it is considered that there are scores of kinds that so closely resemble each other. He thinks that if the varieties in this country were weeded down to the selection of the fittest a dozen would cover the best of them. Truly many are called (by various names) but few chosen after trial.

Veterinary.

A FIGHT WITH THE MICROBES OF LUNG PLAGUE.

DR. JAMES LAW.

(*Continued from Page* 219.)

In carrying out the work of extinction of lung plague in Cook County, the district was mapped out into eight divisions with clearly defined boundaries, so that nothing should be overlooked, and a veterinarian was placed in charge of each division; each became responsible for his own division, made a succession of house-to-house examinations of the entire district, and with the assistance of two helpers, sworn in as deputy sheriffs, marked every bovine animal with an ear tag bearing a given number by which such animal was registered, with its personal description, stall and owner on our records at the office. If on a subsequent visit more or fewer cattle than at first were found in any herd, the animals must still correspond to our office records, the new arrivals must correspond in description and number of ear tag with those entered on our records as sent to this particular herd by permit, and the deficiency must likewise correspond in tag numbers to those shown by our books to have been sent on permit to an abattoir and slaughtered. All movement of cattle from herd to herd within the quarantined area was stopped. Cattle might be introduced by permit from a healthy source outside and by a prescribed route direct to their destination, but they must stay there until sent to slaughter or until the quarantine should be raised. Apart from this, all fresh cattle going to stables within the quarantined area must come direct from the Union Stock-yards. The Stock-Yards company provided that no cattle should be admitted from Cook County, but that only such as came by rail, from outside the county, and from healthy districts should obtain access. This they carried out faithfully; indeed, any admission of Cook County cattle would have been the death sentence of the yards for all store cattle, as no one would have ventured to purchase and make additions to his home herd from an infected market. But we did not need to rely on the stock-yard employés alone for the exclusion of infected and exposed cattle. The city Board of Health had an inspector constantly at the gate to look after the question of diseased meat, and to put the question beyond doubt a Government employé was placed at each gate to prevent all ingress of cattle, and to apply ear-tags and give permits with all cattle passing out and destined to the quarantined stables. This employé at the stock-yard was furnished with a list of stables that had been emptied by slaughter and disinfected and those that had been otherwise attested as free from infection, and to these only was he authorized to grant permits.

Every morning he furnished the office with a duplicate of all permits granted by him the previous day, and these together with those granted at the main office, were arranged in groups according to location, and deputies were furnished with lists of herds to which they had been sent, that they might return to the office a full description of the cattle in such herds with their tag numbers, for comparison with the permits granted the preceding day. If a discrepancy appeared the person who obtained the permit was held responsible and could be prosecuted or punished by the withholding of all future permits, or both.

For some time, until we got all cattle tagged and registered, the law was evaded in isolated cases, but as soon as the record was complete the system worked admirably. Unscrupulous and evil-disposed dealers soon learned that the Nemesis of fate followed closely on the heels of every such contravention, and as the judges loyally sustained the law in its letter and spirit, offenders were compelled to make a virtue of necessity and to respect and obey the statute. From this on we had no trouble from the surreptitious introduction of cattle into quarantined herds.

Another point of no less importance was the system of permits by which alone quarantined cattle could be sent to slaughter, and the obligation of the butcher to kill such only in the presence of a Government veterinary inspector. By a strict appliance of this rule and a holding of the owner or custodian to account for the disappearance of any animal except in accordance therewith, we insured that no diseased animals could be smuggled away, and that even chronic cases of the disease coming from an apparently sound herd would be discovered and recorded. Then there was a standing rule that whenever any case of lung plague, acute or chronic, was furnished by a herd, that herd should be at once purchased and slaughtered and the premises disinfected. But as it was almost invariably the case that, prior to the application of our systematic method, any such infected herd had been in contact with other adjacent herds, on the open commons, such adjacent herds were, as a rule, dealt with in the same way. In the majority of cases the slaughter of such adjoining herds furnished evidence of disease, which justified the precautionary measure, and thus not only the infected herd but the locality was at once purged of the infection. Then as to pasturage: whenever a stock-owner had a fenced pasture to which his cattle could go without becoming exposed on any unfenced ground, there was no restriction, but if they had to pass over open ground, even if it were no more than crossing the street, such movement could only be made under a permit and under the precautions requisite to avoid infection of themselves or others. No permit was given to pasture on land that was not well and securely fenced.

Under such a system as this it could only be a question of time when the last vestige of infection would be destroyed and the country and State freed from the suspicion and restriction. The success came sooner than we had reason to hope, for on the 28th of July the last acute case of the disease was met with, and after this we had only to keep a sharp look-out for chronic cases in the slaughter-house, until all cattle that had been in the infected area prior to the inauguration of our work and had ever been probably exposed to infection had been disposed of. That accomplished there was nothing left, even of a chronic nature, from which a new outbreak could originate, and the lung plague can only start anew when introduced from without.

A year ago I hoped that it might be possible practically to extirpate the disease from New York before I had to leave the work last September; but the drawbacks were so many and potent, (above all the adverse decisions given in the courts, the need for new legislation, and the failure of the appropriation) that it was impossible to realize this hope. In spite of all these draw-backs, I had the satisfaction of seeing Staten Island freed from the plague, Westchester and New York almost purged of its presence and Long Island alone remaining subject to inspection and an example of the unwise opposition of its misguided people—the first place on the Continent to receive the infection and the last probably in both State and Nation to be freed from its grasp. In 30 years this lung plague has never been circumscribed to such narrow limits, and never has the duty been more easy or more urgent to complete its suppression.

Indust'l Societies.

THE TWENTY-SECOND SESSION OF THE AMERICAN POMOLOGICAL SOCIETY.

(R. N.-Y. SHORT-HAND REPORT.)

More about orange culture; great, recent and prospective increase of the industry; lemon culture in Florida.

DURING the last evening session George R. Fairbanks read a highly interesting essay on "The Orange Industry of the United States from a Commercial Standpoint." The enthusiastic orange growers evidently realized that it is very seldom the Northern members of the great pomological family ever come to the citrus region, and that they had better make the most of their visit. Hence the various and exhaustive papers on the orange, lemon, etc. Mr. Fairbanks spoke of the early history of the orange in Florida; how the seeds were brought by the French and Spanish explorers over 300 years ago at the settlement of St. Augustine and later. Soon after the territory was ceded to the United States a few groves along the coast and the St. John's river were planted. Zephaniah Kingsley, an Englishman, became the leading grower at that time, and a small quantity of the fruit found its way North by small coasting vessels. With the advent of steam vessels and railways came the first commercial impetus to this industry.

Where there are now over 10,000 orange groves, there were only a few hundred 20 years ago. A well-established mature grove can be relied upon to produce $300 per acre, even at one dollar a box. Orange growing is the most compact and productive of all agricultural industries. A grove producing 10,000 boxes will freight a train of 33 cars. The present annual orange product of Florida is estimated at 3,000,000 boxes—10,000 carloads—which pay to the railways about $2,000,000 for freight. The box-stuff costs about $390,000; nails $30,000; paper for wrapping $120,000; labor of gathering and packing $600,000; total cost of preparing fruit for market about $1,140,000. To this the cost of cultivation, fertilizers, packing-houses, teams, tram-roads, tools, implements, etc., must, of course, be added. Then when we realize that not more than one-fiftieth of the orange trees in Florida are bearing, the possible and probable future development of this industry seems amazing. We now import about 3,000,000 boxes annually. California produces about 700,000 boxes, and Louisiana two or three hundred thousand more. This brings the total consumption of oranges in the United States to 7,000,000 boxes a year. If all the trees now planted in this country come into bearing, the supply will exceed the present demand.

Dr. J. D. Neal then followed with some remarks on the disease known as "root-knot," which is quite troublesome at the South. He showed a small peach tree and other plants affected, the roots of each being a mass of hard, knotty excrescences. He said the sandy soil of the South was much subject to the disease. In each of the knots are found millions of microscopic worms, he said.

An interesting paper on "Lemon Culture in Florida," by H. S. Kidney, of Winter Park, was presented to the Secretary. The Villa Franca and Belair Premium are the best among the choicer kinds and most profitable to grow. Two-thirds of the groves are of these varieties. "I advise budding upon the sweet or sour orange, the latter the better. Lemons require more moisture than oranges; they should be planted closer—only 15x20 feet apart. Plenty of shade is needed; and with it rust is more apt to be avoided. Five-year-old trees should be 10 to 15 feet high and equally broad. They should then begin to bear, yielding an average of a quarter to a half-box, doubling the yield annually until they produce about eight boxes of fruit when 12 years old. There are usually two crops each year, one ripe in July and August, another in October and November. The tree is less liable to disease than the orange. Florida lemons always bring a high price, averaging $2.50 to $4. per box, and I am very hopeful for the profits of lemon culture here."

Domestic Economy

DRESS.

THIS is the season when the thought of the new spring bonnet and gown is uppermost in the minds of fashion's worshippers.

"I *must* have something new for Easter" each exclaims. "But what?" When Easter comes, the fortunate ones hie them to church to exhibit their new finery, and to "take in" what the others have on, while those who could not revel in a new gown and bonnet, remain at home still doing penance.

Every one likes to be well dressed, as a matter of course, but there are many who are *never* well-dressed, no matter how much money they spend upon their personal adornment, for they lack that most essential of all things—*taste*. No one can be considered well-dressed, no matter how costly the apparel, who is dressed in such a way as to attract universal attention. A true lady, one of innate refinement, will eschew for street wear, bright, glaring colors and striking or gaudy millinery. A person may be considered well-dressed who gives the impression of perfect harmony; who makes one feel that her toilet is complete, even though we cannot specify *what* she has on.

I was making a call a short time ago when the gentleman of the house said, "Oh! I saw Alice to-day and she looked beautiful."

"What did she have on?" asked his wife, woman-like.

"Oh! I don't know," he replied "something soft and gray and sheeny—anyhow she looked lovely."

"That's just like you men," said his wife, "Now I'd have known exactly *what* she wore."

That woman was evidently a well-dressed woman. She left the impression on all that she looked "lovely" and that is all that is necessary. She may have had on a garment made of some simple material, inexpensive, yet made in good taste.

If you cannot afford to have many dresses, get something dark, and plain for what you have. If you get a blue, red, or green dress and are compelled to wear it almost constantly, people will soon come to know you by your frock; while if you get a black or dark brown or gray, you can wear it steadily for many months without attracting attention thereby. It is well to have *always* a good black dress for a "stand-by." This can be worn at any season of the year and will not be out of place. A fresh ruching, a bright bow at the throat, or neat white collar and cuffs will brighten and freshen it up wonderfully. I heard a lady say to another one day: "How is it you always look so nice? I

don't see how you do it on the salary you make and do the other things you do, too."

Her friend laughed and said,

"How many dresses do you think I have?"

"Oh! I don't know" replied the other, "I never thought; only you always look as if you came out of a band-box."

"Well," she answered, "I own just two black dresses. One good one, which I wear on bright days, and one not quite so good which does for the cloudy, dark, or damp days."

Her friend opened her eyes wide with astonishment. But after thinking a moment remembered that she always wore black. The secret lay in the way she cared for her clothes. Every night before going to bed she looked over her dress carefully, put a stitch wherever one was needed. Her facing and braids were kept in order—and that is a job of no small undertaking as my fellow-sisters well know. Her dresses fitted well and brightened up with something at neck and throat, she, as her friend said, "always looked well."

Some people buy whatever is fashionable without knowing whether it is becoming to them or not. This is a great mistake. Now I think of all the known colors red is the loveliest. When I was a youngster I used to implore my mother to buy me a red dress, but she would not do so, because she told me I'd look like a "fright" in it. I didn't believe it—because I didn't know. My sisters wore red; why couldn't I? At any rate I determined that as soon as I grew up and could buy my own clothes I'd have a complete red suit, from the crown of my head to the toe of my foot. Did I? Well, I guess not! Imagine any one with light hair, shading on red, wearing scarlet! I still yearn for a red gown though, and I believe if I ever get rich that I'll have one just to walk up and down my own room in!

Neat gloves and good shoes are the most essential points of one's dress. The French have a favorite saying, which, when translated into our tongue runs—"If one be well gloved and shod, the rest is nothing."

Keep your clothes brushed. The dust, if allowed to remain, fills in the interstices and the garment soon looks rusty.

DORA HARVEY VROOMAN.

KITCHEN TALK.

ANNIE L. JACK.

I THINK there is nothing more trying to a housekeeper than the endeavor to get up a variety for breakfast in winter in the country where the grocer is afar off and the butcher calls only once a week. It is true the larder of the proverbial farm-house is always supposed to be full, and the pork barrel is a never-failing institution. But if one is the least bit inclined to rebel against this as a regular stand-by, and does not happen to be fond of eggs, the question remains, "What shall we have for breakfast?" Tiring of oatmeal lately we have found wheat middlings a pleasant change, light and easy of digestion and very quickly and easily prepared. Home-made marmalade now that oranges are so cheap, is a great treat to some children for breakfast. Rice cakes, from left-over boiled rice of the day before, can be made up with a batter of eggs and milk and baked on a griddle, and corn-meal mush fried in gravy, is very much relished by children who do not care for meat. In spring a breakfast of fresh-water fish, with asparagus and potatoes and a few crisp radishes, is a refreshing change, and the fine flour from corn made into batter cakes with genuine maple sirup, is a real luxury. There is no time of the year when one's appetite is so languid and variable as in the first soft days of early spring.

The proper food for children going to school should be a subject of study; for it only invites to illness to go out on an empty stomach, and yet we all want our little ones to eat what we think is suitable for them. The habit of taking a little of everything, tasting, and leaving part of it, is often copied from their elders, and is a pernicious custom. Given good, plain food, they should be encouraged to finish what they accept. "If grandpa was here he'd make you clean up your plates," said a small child once to a company who were leaving a lot of tasted food to be carried away.

As I write, the kitchen fire burns low, the kettle stops singing, there is a lull in the domestic machinery. Breakfast is over, the clearing up is finished, it is bright and sunny in the window where the canary chirps. Some one said that my kitchen was the cheeriest room in the house, and that is what I want it to be; for with families of moderate means in the country much time must be spent there, especially as in our case where the daughters are mother's help.

OF HIS OPINION STILL.

"A MOTHER," writing to the RURAL of February 16th, fails to see the point of my criticism of Charity Sweetheart's Reveries, and calls it "a tirade against refinement." The dear soul is entitled to her opinion, be it right or wrong, but it recalls an anecdote that I read somewhere of a debate between two children, one of whom delivered this conclusive argument: "It's so! for mother says so, and if mother says so it's so if it ain't so!"

The "refinement" at which I "sneer" is not refinement in any sense of the word, neither according to Webster's Unabridged, nor in accordance with the code of the several States in which I have been. The pseudo-refinement against which the "tirade" was made is the pharisaical egotism of narrow-minded beings, who with the danger of a little learning fondly imagine themselves of a superior mold, and who, in soulful yearning after the utterly utter, would fain flee to Heliconian hights, and serenely exclaim to an admiring world: "We thank God that we are not as are our fathers and brothers, who have no more brains than so many calves." If it is refinement to blazon the faults and misfortunes of brothers, and others to the gaze of the public; to hold up the follies and foibles of loved ones to the shafts of ridicule; to be continually engaged in lauding self at the expense of others; to be continually saying "I"—"I"—"I" it must be confessed that I do despise it.

From masculine women and effeminate men I pray to be delivered. Whenever I see a specimen of the genus Pithecus, commonly called dude, I feel a strong desire to turn him over a barrel and spank him. "Shy and delicate" boys seldom make men of any kind. A very few years finish their brief course, and they are but a memory. There is a vast difference between boyish mischief and natural depravity. A healthy boy is naturally mischievous, and when two or more are together there will the spirit of mischief be also. The ordinary treatment of many boys has a tendency towards driving them away from home to the village store, to the saloon, and into bad company generally, and I make the assertion that more boys are driven to ruin by the treatment accorded them at home than by any natural depravity. Anything is good enough for the boys, any place in the house is good enough for their room. They don't need anything except plenty to eat, and plenty of work to subdue their superabundant energies. No good clothes are needed, no pocket-money, no books, papers, etc., no amusements, no holidays.

Tired mothers exclaim "Boys are *so* much trouble," failing to understand the little animals. Sisters vote them nuisances, and are *so* glad when they have taken themselves off, no matter where, just so they are gone. Under such circumstances no wonder many boys become boorish men, and what else should be expected when the training of home is made to give place to the influences of the saloon, and the village streets? No mother has a right to expect boys to become polished men, when she fails to train them aright at home.

Absurd as it may seem to many, I make the assertion that a woman may be refined, and yet be unable to write her own name, and on the other hand she may have received a common education and be an ignoramus and a slattern all her life. It is an impossibility to make a silk purse out of a sow's ear. I will instance two cases:

In my early manhood among my acquaintances was a young lady whom I considered to be finely educated and accomplished. She made her home with relatives who were both educated and refined. The young lady was a good conversationalist, as most Southern women are, an artist in dress, and a connoiseur in the niceties of good breeding, but she could not write her name. In early life she had been unfortunately situated; had never been to school and was densely ignorant when her aunt took possession of her, and gave her a few years' training. And those few years worked wonders.

Another lady who received the course of the district schools, is greatly afflicted by the home-adornment mania. The walls of her sitting-room are covered with specimens of her handiwork. Crotched what-'al'ye-call-'ems, splint thingumbobs, common chromos with frames of straw fastened with red strings; chromos with frames of split corn-stalks tied with strips of red flannel, with paste-board frames, with paper frames; chromos tacked on the walls, with bits of red flannel over the tacks; strips of red and blue tissue paper woven into a mat and tacked to the wall; splint card-racks filled with highly colored cards; all kinds of figures cut from tissue paper and stuck on the walls; wash-stand in one corner filled with a heterogeneous lot of glass-ware; piles of rubbish and dirt all over the kitchen, floors dirty, windows grimy; madame's dress untidy, with glimpses of underclothes, at neck and wrists, positively black; baby filthy, with head frescoed with a thick coat of grease and dirt that had not been washed off since it was born, more than 12 months before. There was home adornment with a vengeance! Not any of that kind for me, thank you. True? Every word of it, and that's not all.

"Concerning the fish story," There was wife in sitting-room, wife's daughter in parlor, negro cook asleep in kitchen, and head of the house out in the rain doing the work a negro woman was employed to do, all on account of madame's nagging temper.

A MAN.

NOT DEGRADING WORK.

DISH-WASHING—that bugbear of so many young girls in families of moderate means—can be robbed of half its terrors by getting ready for it. First, a big bib apron to cover the whole front of the dress, and loose sleeves with rubber bands at top and bottom to slip over dainty cuffs, and plenty of hot water and towels are necessities. Then gather up, and sort the dishes for washing like this: go around the table taking up knives and spoons in one hand, and forks in the other, to prevent needless scratching: next cups and saucers and fruit dishes; then vegetable dishes, bone plates; etc., and lastly plates and platters, having a convenient dish in which to put refuse food for cat, and dog, or chickens. Don't burn any food unless absolutely necessary. A limber knife and bit of bread, to scrape and rub off crumbs and grease, will make dish-washing a less repulsive task. Now, if both hot water and soap are used freely enough to give the desired cleanliness and polish to the dishes, the fingers will suffer, unless a dish mop, or patent dish-washer is used, (if it only was a *real* dish-washer) which is only a pair of small wire tongs to hold the dish-cloth; a spring wire clothes-pin does very good service if better cannot be procured. Every woman ought to take good care of her hands—keep them as soft and pliable as possible without doing injustice to her work. Nobody really likes to see, or to have, roughened, blackened hands, in spite of the poems written on "Little Brown Hands," and with a little care and forethought much rough work can be done without serious damage to the hands. Stiffened fingers can neither mend stockings as deftly, nor play the piano as well as supple ones, and the busy housewife, who does much of her own sewing, will find it economy to take good care of her hands, as well as the young girl who takes painting or music lessons. Wear old gloves when sweeping or doing rough work, if grandfather *does* look contemptuous; keep a bottle of diluted tartaric acid handy to remove fruit stains, and use glycerine and rose-water—equal parts—to rub on the hands at night. Thos. K. Beecher wrote once that he "should think a woman would be glad, when she broke a dish, to think that she needn't wash that same old dish 365 times next year—aye, 3 *times* 365 times," but so long as we keep this "habit of eating," must dishes be washed, unless that millennium dawns, that Mrs. Fisher wished for so long ago, "when dishes will be made of such cheap material that after a meal one can afford to gather up the four corners of the table-cloth and dump the whole thing into the back-yard, I'd not like to live near that back-yard long, however. Dish-washing *is* monotonous and discouraging work, in that it never stays done, any more than does cooking, or washing and ironing, etc., but if "cleanliness is next to godliness" it cannot be "degrading work," as I recently heard a bright-faced young girl call it. And dish-washing can be idealized, if one wills, as well as digging potatoes I should think, and that has been proven by the RURAL to be an ideal occupation.

AUNT BETTY.

LOOKING GLAD.

AS I gazed on the little dead face of one of my own loved household, much bitterness was added to my sorrow by the thought that he might have been saved if we had only summoned the doctor sooner; if we had only realized how very sick he was, before it was too late to save the precious life. Still another source of sorrow is the thought that I did not always do all that could have been done to make that little life happy. It takes so little to make a child happy! There is one thing I wish I could impress on every young mother's heart. There is something that will cause a child more peaceful pleasure, more perfect content than all other things. I will give a little incident as an illustration. A mother, after a hard day's work, was washing the supper dishes. Six year-old daughter was wiping them. There was quite a long silence, which the little girl broke by asking, "Mamma, what are you looking so glad about?"

Oh, mothers, acquire the habit of "looking glad." The little ones in the house with you study your faces earnestly. They know nothing of your tired feelings. They do not understand your troubles. What do they realize of the debts you must help pay, the losses you have, the lack of convenient articles to do the hard work you must do, and all the crosses you must bear! They know only their own little wants, and think "mamma" can supply them all. If her face is gloomy and dark, they are uncomfortable, and try to carry alone a burden which a few words might set right.

Oh, mothers, if your little ones must wear patches, must eat bread and milk from the kitchen table, and do without pretty toys, by all means treat them to a pleasant face. Bury your own trouble. Keep it out of your face. Practice, and practice, till you can show a face without the least cross look, while the little folks can see you. When your tears get the better of your resolutions, *hide* till the storm is over, clear away its traces, and smile into the eyes of the first prattler you meet. In the old days, you never met your lover with cross looks and tears. Now, never meet your children, as you would have hesitated to let him see you.

MRS. LEVI H. NILES.

TWO NEW ENGLAND RECIPES.

BAKED BEANS.

PUT the beans in cold water to soak, the night before. Next morning, put in a colander, and rinse two or three times. Then put them in a kettle with the pork you intend to bake, cover with water, and boil one and one-half hour. It needs one pound of pork for one quart of beans. When the beans are soft, put into the bean pot with just water enough to cover, add a pinch of pepper. Bake three or four hours in a moderately hot oven.

BOSTON BROWN BREAD.

THREE and three-quarters cups of Indian corn-meal, two and one-half cups of rye meal (not flour), two-thirds of a cup of molasses, one quart of milk, (either sweet or sour,) two even tea spoonfuls of soda dissolved in the milk; steam in a tin pudding boiler five hours. Take off the cover and leave in until morning.

MRS. J. STEIGLEDER.

Woman's Work.

CONDUCTED BY EMILY LOUISE TAPLIN.

KILLING TIME.

OLIVE E. DANA.

I SUPPOSE most of us are busy people and therefore as healthy, earnest folk ought, have a hearty contempt for that old phrase "killing time," and especially for the thing itself. It seems to me to belong only to certain aimless pleasures of the so-called fashionable world, or to the extravagances of certain harmless individuals whose intellects seem in inverse ratio to their pocket-books. It probably does not occur to us that we are guilty of the same folly; yet is it not often true? Do we not do it practically in many ways? Was it not something like it when we bestowed much labor, beside dimes and dollars, on a certain piece of fancy-work which, when done, had little beauty, it may be, or, very likely, was too good for the rest of the furnishings? How many hours every week do we spend in unprofitable reading? How many in equally unprofitable dreaming or "moping" or worrying? If we are "alive unto God," our time must partake of that consecrated vitality. We are making it in a great measure null when we plan out more than we can do in a given time and perhaps have to leave that which was most necessary. We are despoiling it as surely when we overload and distend it as when we make it bear and hold too little. We do most fatally misuse it by over-work and over-worry. There is no way so painful to ourselves, who must bear the pains of all dying hours, as to thus

destroy it as it were before-hand. We learn by experience how not to do it.

WHETHER IT PAYS.

DID you notice what Miss Dana says about doing one thing at a time? She is right; it doesn't pay to do more than our strength can bear, especially when it is unnecessary. A great deal of harm is done by ambitious girls who are bent on utilizing every moment in some way. The idea of trying to study, for example, when the body is completely tired out! Certainly it does not pay. Change of occupations certainly rests one, but, all the same, one cannot really study profitably when one is tired out.

Fancy-work is one of our greatest relaxations; certainly the needle is one of the greatest blessings we women possess. But, all the same,a good deal of it does not really pay. Take, for example, much of the crocheted edging one sees. It is terribly trying to the eyes especially by lamp-light—yet many girls spend their evenings entirely in this work. It does not really cost much, if any, less than bought trimming;—taking into account the wear and tear on one's eyes it costs more. Of course, there is the pleasure of making, but, after all, does it pay?

Perpetual practice on the piano when a girl has no actual taste for music—does that pay? I don't think it does. There ought to be music in every household, if possible, but, all the same, there is a great deal of valuable time wasted in music by girls whose taste lies in other directions, merely because it is the custom. As far as social qualities go, a girl who can talk pleasantly and sympathetically will always attract far more than one whose cultivation is musical, and nothing else.

PATTY GARTON.

SMOKING IN PRIVATE.

SMOKING in public is bad enough, but it is a question whether or not it results in as much personal injury and inconvenience to those who dislike smoking as the habit of smoking at home. In public we can get away from those who are obnoxious to us, but in private it is sometimes almost impossible. I sometimes think chronic smokers take a fiendish sort of delight in tormenting those who do not smoke. How often when visiting at the house of our friends is our whole evening's enjoyment spoiled by the after-dinner cigar! If we adjourn to the piazza or take a stroll about the grounds the master of the house insists upon the omnipresent cigar. If we go riding the host drives, sits upon the front seat and the tobacco smoke is wafted back into our faces. If a private rowing or sailing party is proposed, the so-called gentlemen must load up with cigars or cigarettes. On every side—everywhere--we come in close contact with the poisonous vapor.

Who can tell how many headaches have been caused, how many delicate lives sacrificed by this deadly nicotine? How horrible the fate of a delicate and sensitive woman who is tied for life to a habitual smoker. Few men are drunk on liquors or beer all the time, while many men are dull and stupid, narcotized all the time. Respect for a man's family ought to induce him to abandon the disgusting habit even if he cared nothing for the comfort or welfare of the public.

In the matter of smoking there is a lingering relic of the homage which men formerly paid to women. Almost any man, who makes any professions of being a gentleman, will ask ladies if smoking is objectionable to them before lighting a pipe or cigar in their presence. Who ever heard of one man asking another if he objected to smoking? It is, however, a fact that some men suffer greatly from inhaling tobacco smoke; as a rule, they suffer in silence for fear of hurting the feelings of the smoker or of being called a crank.

To sum the matter up, I would make a new and imperative rule of etiquette, that *no man should smoke in the presence of other men who are not smoking, or in the presence of ladies or children.* J. H. G.

GOLDEN GRAINS.

THE REV. F. D. KELSEY concludes a pleasing sketch of a Chinaman who was helped by a lady and who returned her kindness by making her a handsome and costly present by saying that we must carry to the needy Christ's gospel of the loaves and fishes—the gospel of bread and cordwood and coats—until men realize that religion is more than a formulary, creed or ritual.....

FLAVAL says that when God intends to fill a soul, he first makes it empty; when he intends to enrich a soul, he first makes it poor; when he intends to exalt a soul,he first makes it humble; when he intends to save a soul, he first makes it sensible of its own miseries, wants and nothingness.....

TALMAGE says that if you want to have a stalwart Christian character, plant it right out-of-doors in the great field of Christian usefulness, and though the hot sun of trial may try to consume it, it will thrive until it becomes a great tree, in which the fowls of heaven may have their habitation.....

SIR HENRY TAYLOR says a secret may be sometimes best kept by keeping the secret of its being a secret. It is not many years since a State secret of the greatest importance was printed without being divulged, merely by sending it to the press like any other matter, and trusting to the mechanical habits of the persons employed for their printing the document without knowing what subject it related to.....

GOOD nature disarms enmity, allays irritation, stops even the garrulity of fault-finding. It more than half overcomes envy. A really good-natured man is the most troublesome morsel that the malign passions ever attempted to feed upon. He is the natural superior of irritable persons .....

ROBERTSON says that what the world calls virtue is a name and a dream without Christ. The foundation of all human excellence must be laid deep in the blood of the Redeemer's cross, and in the power of his resurrection....

UNCLE ESEK says in the Century "I have heard of men who knew more than they could tell, but I never have met one. If a man has a genuine idea, he can make himself understood."....

"FAITH won't enable a man to lift a ton all at once, but it will, ten pounds at a time."...

"YOU may travel a good ways on whisky, and travel fast while you are going, but you can't get back when you want to."....

LONGFELLOW says "Ah, how wonderful is the advent of the spring! the great annual miracle of the blossoming of Aaron's rod, repeated on myriads and myriads of branches! the gentle progression and growth of herbs, flowers, trees, gentle, and yet irrepressible, which no force can stay, no violence restrain, like love that wins its way and cannot be withstood by any human power because itself is divine power."....

THE I X L COIL SPRING ROAD CART

Beyond a doubt is the easiest riding cart made. Springs can be adjusted for one or two passengers. Before purchasing write for wholesale prices. A. L. PRATT & CO., No. 71 Willard St., Kalamazoo, Mich.

THE Brompton Hospital for consumptives, London, England, published a statement that 52 per cent. of the patients in that institution had unsuspected kidney disease. Every drop of blood in the system passes thousands of times through the lungs in each 24 hours. The same blood passes through the kidneys for purification. If the kidneys are not in a healthy condition or able to expel the poisonous or waste matter the acids return to the delicate tissues of the lungs and produce irritation, which results in the symptoms of what is known as consumption. This explains why 52 per cent. of the consumptive patients have unsuspected kidney disorder. Warner's Safe Cure puts the kidneys in a healthy condition taking the acids from the blood which vitiate the lungs and cause consumption.

LATEST MARKETS.

AGAIN the advertisers have monopolized so much of our space that a report on markets is out of the question. There is, however, but little change from our last report.

The Encouragement of Numbers.

Which do you prefer to lose, your health or your fortune?

After all, there is no alternative, if you lose your health you lose your fortune.

On the other hand, if you gain health, you gain fortune, for have not our wise old philosophers agreed that Health is Wealth?

From our standpoint, we might say that Compound Oxygen leads to this best of all, wealth.

But we leave that as an inference from what our patients say of us.

Note the encouragement in the following:

OFFICE OF JOURNALIST,
NEW YORK, July 28, 1888.

We rarely notice anything of a medical nature in the columns of the Journalist, but we must make an exception in favor of Starkey & Palen's Compound Oxygen, which we know to be all that they claim for it, and so give it our hearty and unqualified indorsement.

UTICA, MISS., July 18, 1888.

I most cordially recommend your home treatment to all persons suffering from nervous prostration or general debility, neuralgia and sick headache. Indeed, I would say, all chronic diseases. MRS. THOS. H. LEWIS.

ALBANY, OREGON, LIME CO., JULY 19, 1888.

At the time I ordered your treatment for my son, he was compelled to leave school, he was so ill. Thanks to your Compound Oxygen, he is now able to be about all the time; is not troubled with catarrh, and has not had an attack of asthma since he began using it.
MRS. C. M. WILLARD.

These instances are valuable, of course, so far as they go, but if you would like the encouragement of numbers, send for our brochure of 200 pages; it will be forwarded free of charge to any one addressing DRS. STARKEY & PALEN, 1529 Arch Street, Philadelphia, Pa., or 331 Montgomery street, San Francisco, Cal.—*Adv.*

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING APRIL 6, 1889.

The Kodak.

ANYBODY can use the KODAK. The operation of making a picture consists simply of pressing a button. One hundred instantaneous pictures are made without reloading. No dark room or chemicals are necessary. A division of labor is offered, whereby all the work of finishing the pictures is done at the factory, where the camera can be sent to be re-loaded. The operator need not learn anything about photography. He can "*press the button*"—*we do the rest.*

PRICE $25.00.

Send for copy of KODAK Primer, with sample photograph. Mention Rural New-Yorker.

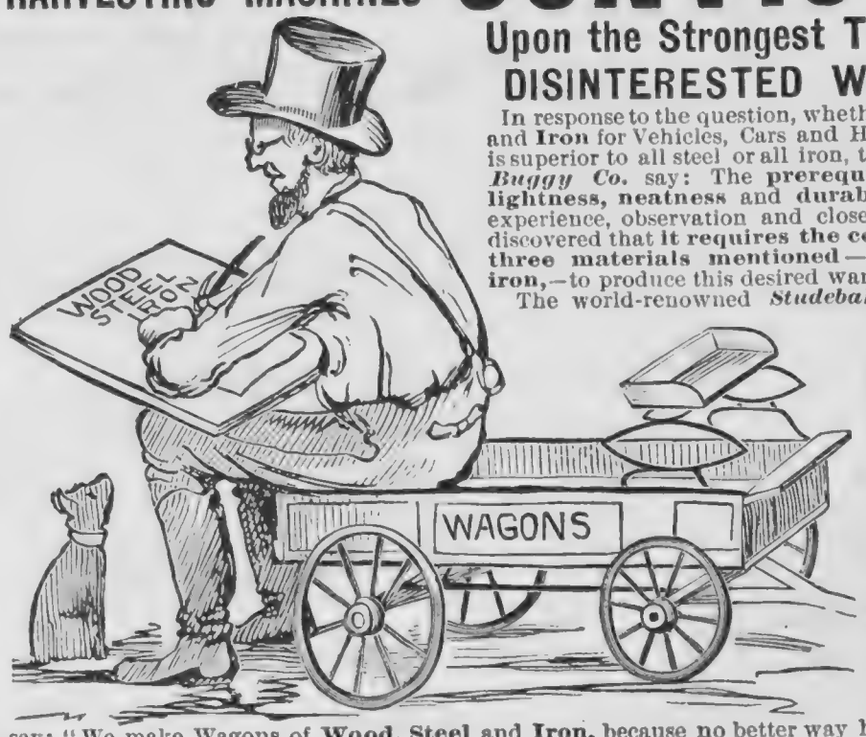
"ALL-STEEL" HARVESTING MACHINES CONVICTED
Upon the Strongest Testimony of DISINTERESTED WITNESSES.



In response to the question, whether **Wood** and **Steel** and **Iron** for Vehicles, Cars and Harvesting Machines is superior to all steel or all iron, the great *Columbus Buggy Co.* say: The **prerequisite is strength, lightness, neatness** and **durability,** and through experience, observation and close study it has been discovered that **it requires the combination of the three materials mentioned—wood, steel and iron,**—to produce this desired want.

The world-renowned *Studebaker Bros.* in substance say:

"We use a combination of **Wood, Steel** and **Iron** for the reason that these materials seem to be **best adapted** to meet the ends designed. Iron Gear, when subjected to severe strains, **wrenches the Frame. Once out of shape, the yre main so, and grow worse and worse the longer they are used.**

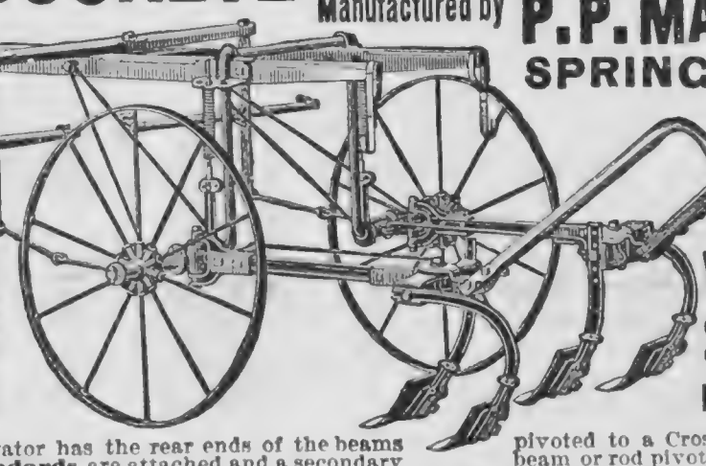
The popular *Milburn Wagon Co.* say: "We make Wagons of **Wood, Steel and Iron,** because no better way has been discovered. **The tendency upon Iron Gears is to work at the bolts.** Some years ago we constructed a Wagon of all iron, except the reach, tongue, double and single trees, but our experiments were not such as to lead us to go further."

The reliable *Emerson & Fisher Co.* say: "That **the great objection to an all-steel Vehicle** is the vibration of the metal if not combined with wood. There is a tendency in iron and steel to crystallize and become brittle. The clamping of wood and iron together diminishes the tendency to crystallize.

The famed *Moline Wagon Co.* say: "A better and more durable vehicle can be constructed of part wood and part iron or steel than of metal exclusively. An all-metal vehicle would soon pound itself to pieces and force off the bolts, nuts and rivets. The elasticity of wood will obviate this."

The Celebrated BUCKEYE BINDER is **NOT an ALL-STEEL MACHINE, but is a combination of Wood, and Steel, and Iron,** and consequently the best Harvesting Machine in the world. An illustrated Catalogue sent free to every farmer contemplating the purchase of a Machine. Address
AULTMAN, MILLER & CO., AKRON, O., U. S. A.

NEW BUCKEYE SUNBEAM CULTIVATOR
Manufactured by **P.P. MAST & CO.**
SPRINGFIELD, O.



With METAL WHEELS and SPRINGS at Ends of Beams.

This Cultivator has the rear ends of the beams pivoted to a Cross-head to which the **Shovel Standards** are attached and a secondary beam or rod pivoted to the coupling in front and to the Cross-head in the rear, by which the Shovels are carried parallel with the axle, whatever may be the position of them in being moved sidewise. The spring at the front end of the beams supports them when in use, and enables the operator to move them easily from side to side and assists in raising when he wishes to hook them up while turning at the end of the row. We attach these Beams also to our **Riding** and **Tongueless Cultivators.** This Cultivator has no equal in the market, and can not fail to be appreciated by any farmer who sees it. We also manufacture the BUCKEYE DRILL, BUCKEYE SEEDER, BUCKEYE CIDER MILLS AND HAY RAKES.

Branch Houses:—**Philadelphia, Pa.; Peoria, Ills.; St. Paul, Minn.; Kansas City, Mo.;** and **San Francisco, Cal.** Write for Circular to either of the above firms or to

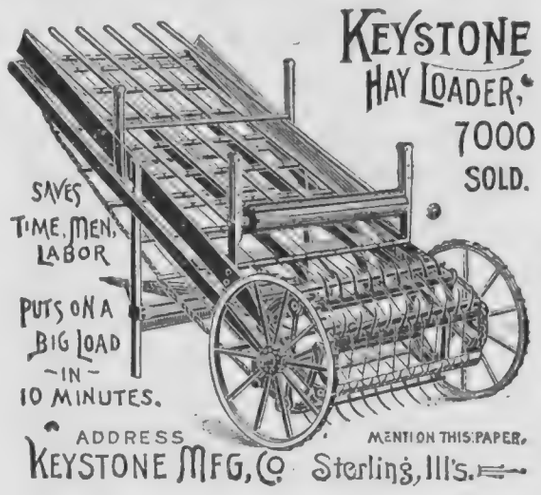
Please remember that this meal has an intrinsic value equivalent to three times over that of corn or oats. Write us for prices and other particulars, and mention the RURAL NEW-YORKER.

DETROIT LINSEED OIL CO.,
Detroit, Mich.



ADDRESS MENTION THIS PAPER.
KEYSTONE MFG. Co Sterling, Ill's.

DR. T. HEMAN BREHMER, an eminent German authority, says: "Consumption is always due to deficient nutrition of the lungs, caused by bad blood." At the Brompton Hospital for consumptives, London, England, a statement has been published that 52 per cent. of the patients of that institution have unsuspected kidney disorder. This explains why the proprietors of Warner's Safe Cure claim that they have received many testimonials which they have not published, because of the incredulity with which they would be received were it claimed that Warner's Safe Cure cures consumption. But the fact is that if your kidneys be cured and put in a healthy condition they expel the uric acid and poisonous waste matter, and prevent the irritation of the delicate substances of the lungs, thereby removing the cause. When the effect is removed the symptom of kidney disease, which is called consumption, disappears, and with it the irritation, which caused it.

CATALOGUES, ETC., RECEIVED.

JAS. M. THORBURN & CO., 15 JOHN STREET, N. Y.—A catalogue of unusual merit on account of its careful and judicious selections. It opens with a list of gladioli. Among these are Lemoine's Hybrids. Then come hardy lilies; then amaryllis, tuberous begonias, new cannas, dahlias, iris, pæonias, tube-roses, chrysanthemums, miscellaneous bulbs and roots, seeds of new flowers of merit. Then we have new and selected strains of vegetables, fertilizers, lawn-mowers, etc. Among the latter is the "New Model"—the 12 inch cut, $7.50—20-inch cut, $12.00.

A HANDY TOOL FOR EVERY FARMER.—This is what the Boston Knife Tool Company of Boston, Mass., call the little implement they are now introducing. It is an exceedingly handy little tool for cutting and trimming bushes and vines.

THE CONSTITUTION OF MILK.—Bulletin No. 18 from the Experiment Station at Madison, Wisconsin. We regard this as one of the most important contributions to dairy literature that has been published of late years. It is fully in line with the famous dairy studies that have preceded it from this Station. We have only the space for a mere mention of the pamphlet this week. Next week we hope to review it at length.

CORN EXPERIMENTS.—This is the title of Bulletin No. 17 issued by the Kentucky Experiment Station. It is one of the most interesting of the purely scientific papers that the Stations have yet given us. Every farmer who undertakes to use chemical fertilizers finds himself confronted by the problem: "What element of fertility does my soil need?" It is quite possible to conceive of cases where farmers have applied fertilizing elements that were not needed. The land may have been lacking in but one element—perhaps potash or perhaps phosphoric acid. Instead of knowing what was needed and supplying that one thing, such farmers may have applied small quantities of the needed element and larger quantities of substances already contained in the soil in abundance. How shall the farmer know his soil's disease? This very question was propounded by the director of the Kentucky Experiment Station and answered by the crops in a most emphatic way. Corn was the crop taken for the experiment, and the grain was planted on equal-sized plots; on one plot no fertilizer was used, on another a mixture of phosphoric acid, potash and ammonia, on another phosphoric acid and potash, on another phosphoric acid and ammonia, and on another potash and ammonia. The plots were carefully watched and the entire product of stalks and grain weighed. The results plainly showed that potash was the element needed in that particular soil. It might be well for farmers to read this bulletin and see how the tests were made. If they are to use chemical fertilizers at all, it will certainly pay to use them with all the skill and system possible. We may add to what has been said above, that the use of the potash was attended with a greater degree of financial profit than that of any of the other fertilizers.

CANADIAN AGRICULTURAL EXPERIMENTS.—This volume is sent by Wm. Saunders, Ottawa, Canada. It contains a report of the year's work at the main experiment farm at Ottawa, and also short reports from branch farms located in Nova Scotia, Manitoba and N. W. Territory. One of the most interesting sections in the book is that containing the report of the experiments with poultry. So far as we know, this is the first station to attempt poultry experiments. Nothing beyond a mere beginning has been made here, but it is hoped that this beginning may lead to the development of important and interesting facts. An egg record has been started, but as only a few months have elapsed since the opening of the experiment, no conclusions have been reached. It seems evident that hatching eggs can be successfully shipped from England, and it seems equally certain that the substance in which such eggs are packed may have something to do with their vitality. The eggs that gave best results were wrapped singly in paper and then packed in bran. It stated that Canadian poultrymen strongly condemn the common practice of packing eggs in fine sawdust. Red Caps and Indian Games have not been found suitable for a Canadian climate. They seem to lack hardiness. The standard varieties have given excellent results, the Plymouth Rock notably so. In a test for weight, a P. R. showed a marked superiority over specimens of the Wyandotte, Buff Cochin and Houdan breeds. The only crosses yet attempted are the following: Brahma cock on Plymouth Rock hens and Brahma cock on Black Minorca hens. The latter cross seems to promise the better results. Quite an interesting test was made to ascertain the age at which pullets of different breeds would begin to lay. The following results were obtained, the figures representing the number of days that elapsed between the date of incubation and the date on which the first egg was laid.

Houdan	214	days.
S. P. Hamburg	215	"
Black Minorca	204	"
White "	207	"
Black Hamburg	222	"
Andalusian	231	"
Plymouth Rock	217	"
Buff Cochin	243	"

As some of our readers may be interested in the methods employed in feeding the birds, we make the following extract from the report: It must be remembered that this feeding was done in winter.

"The morning feed was varied, but always warm and known as "soft." It was composed of two parts shorts, one part corn-meal and one part boiled wheat. The hot water the wheat was boiled in was used for mixing the feed. To the mixture was added, almost every morning, a small quantity of Cayenne pepper and bone-meal. Twice or three times a week meat scraps were substituted for the bone-meal and boiled wheat. At other times small potatoes and scraps of cabbage formed the greater part of the morning meal. On this variety the layers were fed barely enough to satisfy and never enough to gorge. Soon after, when the water was given for drink, a few handfuls of small wheat or ground meat were thrown into the chaff, always on the floor for the fowls to scratch in, every effort to keep them in activity being of paramount importance. The noon meal was light and scattered in the chaff. The last feed of grain, also thrown on the floor, was liberally given and the layers sent to roost with a full crop to carry them over the long night fast. A cabbage suspended from the center of the pen was also used as an incentive to exercise. Oyster shells (ground) and gravel were also supplied. The temperature varied from 30 to 45 and 50. On reaching the two latter figures the morning feed was greatly reduced and more dry grain given. At the lower figure the chill was taken off the water given to the layers."

Law.

"Every Man is presumed to know the Law. Nine-tenths of all Litigation arises from Ignorance of Law."

VALIDITY OF A MARRIED WOMAN'S SEPARATE DEED OF REAL ESTATE.

M. T. T., Elmira, N. Y.—If a married woman has a farm conveyed to her in her own right, can she legally convey the same to another party without the signature of her husband accompanying her signature in the deed? The husband having been away for a dozen years, his whereabouts being unknown, and his signature unobtainable, can she contract for the sale of the farm and give a clear title to the purchaser.

ANS.—A married woman in this State who is possessed of real estate as her separate property, may bargain, sell and convey such property and enter into any contract in reference to the same with the like effects in all respects as if she were unmarried, and she may, in like manner, enter into such covenant or covenants for title as are usual in conveyances of real estate, which covenants shall bind her separate property in case the same or any of them are broken. Before 1862 the husband's consent in writing was necessary to complete the conveyance, except in cases where it could not be obtained by reason of his absence, insanity or other disability, but now his consent is not necessary in any case.

E. H. P., Salem, Mass.—A has a mortgage on B's farm; C says he bought a wood lot in said farm of B, and he has cut the wood off. Can A collect the value of the wood from C.

ANS.—We suppose the lot was not sold—only the timber thereon. If the land and timber were both sold, or if the trees only were sold, and A's mortgage was properly recorded, C is liable for damages, as he should have investigated the records before purchasing. Had he done so, he would have discovered that B could not give a valid title.

A PALACE FOR INVALIDS.

The Most Superb Health Home in the World.

POSSESSING THE COMBINED ATTRACTIONS AND ADVANTAGES OF THE FAMOUS RESORTS OF EUROPE, ASIA AND AMERICA

Progressive, Liberal and Scientific Treatment of Disease in a Fairy-like Palace of Unequaled Splendor.

WONDERFUL WORKS ACCOMPLISHED IN REPRESENTATIVE HOMES OF NEW ENGLAND.

TENS of thousands of people go every year to Europe seeking health. The crossing of the ocean, with its storms and tempests, the inconveniences of travel, and the enormous attending expense, are no barriers whatever to those in search of health.

The weary Ponce De Leon ceased not his wanderings in search of something to restore his waning life; the fair Floridas suggested a cure, but, alas! they failed him; the Elysian fields of the "Amazon" promised all he wanted, but they gave him disappointment; the Isle of Cuba charmed him, he tarried, but again doomed to despair he journeyed on.

Hundreds of thousands visit the springs, mountains, and various health resorts every year in search of health, while fully as many more come from the interior States to the sea to board every season, seeking nature's boon. It has been estimated that sea-bathing in the summer has done more to recuperate and cure men and women suffering with chronic diseases than all the doctors in the country, for there is no estimation of the value of sea-baths in chronic diseases. Yet the per cent. of cures is small; not that there is less virtue in sea water than in the days of Mahallian, when he bade the raging ocean

CURE THE TROUBLED LAND,

but the inconveniences of taking baths upon the beach, the cold chills often taken during and following these baths, counteract to a great extent the good of the baths

The thousands who go abroad to Baden-Baden, and the famous Carlsbad, and waters of Nice, the pure and medicated rills of Switzerland, the lakes of Warsaw, the baths of Beyroot, and ancient fountains of Bagdad, all seeking health, evidence two things,—first, that our country is a country of invalids, and, second, that but few of these invalids find what they are searching for.

Ribwell, when dying, said he would give a million of money for a moment of time. Almost any one would give all he possesses for his life, and almost all his possessions for his health, if through such expensive channels only these could be obtained.

In reply to the question of "What value do you put upon health?" Lord Erskine said, "It is my opinion that a man or woman is worth more to the world during three years of living if in good health, than in fifty years of half invalidism; for my part, I would rather live one year enjoying good health, than ten years half sick."

"As cold as the grave, and as dark and uncertain the beyond, I would rather take my chances and go," said the celebrated Dr. Jay, "than eke out the miserable existence of the invalid that so many do." Such is evidently the feeling of most sufferers, and but for conscience, and the hope of improvement on the morrow, suicide would be a most common occurrence.

For hundreds and thousands of years men and women have been rendered helpless, or died at the end of years of suffering, with such diseases as Paralysis, Nervous Prostration, Cancer, Consumption, Scrofula, Neuralgia, Rheumatism, Kidney and Liver diseases, with as great certainty as they would had the knife pierced their vitals. During all this time the world has been full of doctors, trying to relieve, to cure; some have been relieved and occasionally one cured, but the great

ARMY OF AGES,

numbering millions and hundreds of millions, have found no relief whatever from the physician. It has ever been as it is to-day. Where one is helped, hundreds get no relief whatever. You will hear every day some one saying: I have tried a number of doctors but none of them has ever done me any good. All this goes to show that there is little virtue in medicine; scarcely can one be found suffering from any chronic disease, that the name of medicine will not disgust. You will hear on every hand the expression, "I have tried all kinds of medicine; they are

NO GOOD! NO GOOD! NO GOOD!"

Is it any wonder that in this progressive age, with the cry of "excelsior" heard on every hand, that the progressive medical brains should break away from these old methods of treatment, that in search of health, and in the hope of giving health to others, they should concentrate the sun's rays, bottle electricity, cultivate mesmerism, develop magnetism, and wrestle with the powers of mind? Is it any wonder that the progressive brains of the Nineteenth century should seek a new and shorter avenue to health and life, since the old drug systems for 4,000 years had proved

SUCH A FAILURE!

Most wonderful progress has been made during the last few years. Hygiene has been born with its multitude of blessings, and water, pure water, cold water, which for hundreds of years was looked upon as the scourge of the sick room, has proven to be the angel of comfort and life to the sick and dying. In the face of the bitterest persecutions electricity and magnetism have been discovered and proven to be among the most effective curative agents of this age. The power of concentrated sunlight and heat to cure the germs of disease and restore the prostrated has been demonstrated in the face of fiercest opposition.

Perhaps the most distinguished progressive physician of this age, who has done more than any one else to break away from the old drugs, poisons, and instruments of torture, and introduce in their stead, more effective, humane, kindlier, and finer methods of cure, is Dr. R. C. Flower of Boston, Mass. Should I ask the question: Who has not heard of Dr. Flower? but few in our land could say, "Not I." Though only a young man he has for years enjoyed the largest practice of any physician in the world. The doctor has recently consummated the great desire of his life, in the building of a great Health Palace in the heart of the city of Boston, on one of the most beautiful avenues. It is said that his Health Palace is the finest in the world, in fact the finest ever built in any world, as far as known.

Here Dr. Flower has combined every phase of treatment containing any merit whatever one could find should he visit every health resort in the world. The following description of Dr. Flower's Health Palace we take from the Washington *Post* of Feb. 16, and while it is strictly true, it poorly does justice to the virtue and beauty of this great enterprise of the 19th century.

On the second floor, in addition to bed chambers, are private dining-rooms and parlors. On the first floor, large parlors, reception-rooms, conservatory of flowers, office, dining-rooms, café, news stands, telegraph offices and reading-rooms and in the rear of the building professional offices. This floor beggars description. It is richly furnished and set in jewels of the purest kind. It is very grand. Everything your eyes rest upon is artistic and superb. The wood carving of the enormous arches, columns and pillars is the finest we have ever seen, and suggests the old Moorish palaces of the Orient.

The building is lighted by electricity from top to bottom, and in all the rooms and halls are electric bells. Over 17 miles of electric wires run through the building. There are two large front stairways, three back stairways, and two elevators. The house is heated by a new process, which changes the air in every room of the building every three minutes, making and keeping each room the temperature desired, and keeping the floor of each room warmer than the ceiling.

In the large, deep half-basement is the bath department, which is evidently the most elaborate bath establishment in all the country. Here are long rows of Russian and Turkish bathrooms, electrical rooms, for all kinds of electrical treatment; hot and cold seabath-rooms, sulphur-bathrooms, medicated-bath-rooms, numerous shampoo rooms, spacious bathroom parlors for sitting, reclining, and

sleeping; and here let me say that this entire bath department is fitted up in the same oriental splendor and beauty as is the building itself. The plunge bath, or swimming pool in the center of these baths, is worthy of special attention. If anything of the kind exists on this earth, I have never seen it or heard of it.

This magnificent swimming pool is filled with sea water, which comes through artesian wells from some subterranean ocean, which pours a constant stream in and a constant stream out. The decorations of the walls and ceilings of this plunge bath resemble the dazzling pictures of fairy land. On one side the spectacular view of the ocean, with its surging waves and ships arriving and departing. On the other side mountains of verdure and homes of beauty. Turn on the electric lights, and the scene

IS A TROPICAL ONE.

Far in the east the moon is seen, and the stars shine from overhead. Seemingly, various tropical creatures and animals appear, coming from their hiding-places, while down yonder grotto, which looks a mile away, pours a Niagara of water, spurting amid the lilies and the flags.

I have recently visited Dr. Flower's offices in the Flower Palace, corner Columbus Ave., and Holyoke Street. I have seen and conversed with scores of people, if not hundreds, who have come from all parts of the world, to be cured by the doctor and his associates. *I do not exaggerate when I say that they are cured, cured at the mouth of the grave, and when given up by others to die, cured in a most marvelous way.*

I found it impossible to get an interview with Dr. Flower for more than a minute for anything outside of his patients.

"Just a word, Doctor," I said; "tell me

ABOUT THIS HEALTH HOME."

"Well, sir," he said, "it has been my desire for years to build a place different from any other place in the world. A place perfect in all things, like a large, palatial home; cheerful, beautiful, and sunshiny, where every kind of treatment of any merit can be given skillfully, kindly, and thoroughly. This is just what this health place is. There is nothing in the world like it, and, as far as I know, has never been. But I seriously trust that we may soon have many such places in our country. If there is any cure on this earth for the sick, they can find it here. Now you must excuse me," he said, "I must attend to these patients."

We made personal inquiries of a number of his patients, and prominent business men in the city. They were all loud in their praise of Dr. Flower, and were unanimous in their declarations that there was no such physician as he in the world. The following, from the Hon. J. Willard Rice, of the large paper manufacturing house of Rice, Kendall & Co., 91 Federal Street, Boston, is a fair sample of what they all said. No one is better known politically or in extended business circles than Mr. Rice, one of the leading business men of New England, a gentleman of about 70 years of age. "Yes," said Mr. Rice, "I know Dr. Flower well. I have known him intimately for years. I regard him as the most wonderful physician in the world. I have never known his equal. In business he is an ideal man, and as a gentleman he has no superior; is cultured and refined in every way."

PROF. R. F. HUMISTON,

of 413 Shawmut Ave., said: "I have known Dr. Flower for many years. I regard him the greatest living physician. I never knew such a man or such a doctor. If miracles are worked Dr. Flower works them. I have known him make the paralytic and lame, who had been helpless all their lives, spring to their feet and walk forth in health, also dissolve and pass away great tumors in a very short time, when other physicians and hospitals had pronounced them incurable. It is my opinion," said this gray-headed professor, "that Dr. Flower is the greatest physician on this earth; he cures when others fail, and the worst cases seem to be his greatest victories."

Mrs. J. H. Grueby, of 228 West Canton St., Boston, said: "For seven years I suffered intensely from cancerous humor of the stomach, during which time I had been treated by several of the leading physicians of the city. They failed to even give me relief. During the last two years of my suffering I could not bear the weight of my clothes against my stomach, or lie down day or night without an increase of the pain. The last regular physician who treated me, said he did not believe there was any help for me, but would advise that I consult some specialist. I decided to do so, and having often heard of Dr. R. C. Flower and his wonderful cures, I made up my mind, as the very last resort to consult him. Imagine my surprise upon entering his office, to have him tell me my disease and troubles in detail better than I could have told him, without asking me a question. I placed myself immediately under his treatment, soon began to improve, and am to-day a healthy, well, and sound woman. I have seen a great many of Dr. Flower's patients at different times, and they all tell of the same wonderful cures."

Selecting the names and addresses of a few of the Doctor's patients in different parts of New England, we started a personal investigation to see if these things were really true.

CANCEROUS TUMOR.

Mrs. J. L. Horne, of Norway, Me., said: "*I had a very large internal tumor—had it removed with a knife, but it soon returned more malignant than ever*, and finally pronounced cancerous tumor, and that there was no help for it. I had the best physicians of this city and Portland attend me until my case was decided incurable. In my despair I went to Dr. Flower, of Boston, and, to be brief, I would say he entirely removed the tumor without the use of the knife, in less than eight months and without pain. This was over four years ago, and I have been in the best of health ever since. I regard Dr. Flower as the most wonderful and greatest physician of the world. I do not believe there ever was such a man: I know dozens of his patients who think of him as I do." Mrs. Horne is a very prominent lady of about fifty years of age, her husband being one of the leading business men of the State.

MISS EMMA SMITH,

of Norway, Me., a prominent society woman of one of the leading families of the State, said: "I was treated for a large fungus growth and dropsy. I was so large that I could scarcely get up or down, or hold my weight up. *My case was pronounced hopeless, and I expected to die any day.* It was with great difficulty I was taken to see Dr. Flower. He took my case, treated me eight months, and cured me entirely; this was about four years ago. I have been in excellent health, ever since. I do not think there was ever such a doctor in the world as he is. Many of his cures are like miracles; he shows his greatest powers when all others fail."

Mrs. Edwin Wallace, Rochester, N. H., said: "I was treated some years ago

FOR DIABETES AND PARALYSIS.

It was wonderful what Dr. Flower did for me; he saved my life. We regard him as a most wonderful doctor and a perfect gentleman. I know of a number of cures, almost miracles, performed by Dr. Flower; a lady friend of mine in Maine, was cured by Dr. Flower of malignant cancerous tumor, after she had been given up as incurable by the leading medical lights of the east." Mrs. Wallace is one of the most prominent women of New Hampshire, and wife of one of the largest manufacturers in the east.

X. E. Mills, of Milford, N. H., a prominent and elderly citizen of the place. He said: "Ever since my army life I suffered intensely with my stomach; doctors had doctored me for everything they could think of, but all gave me up by saying 'We can't tell what the trouble is'; during all this time I grew worse and worse; in fact my misery became so great that every moment of my life was one of mortal agony; the cold perspiration of suffering stood in beads over me nearly all the time. In my distress and despair, suffering almost death but unable to die, I went to see Dr. R.C. Flower, of Boston (this was six years ago). No sooner had I entered Dr. Flower's presence than he told me that I had swallowed an animal, or some kind of a water creature found in Southern swamps. "Did you ever drink water from the filthy swamps in the South?' he asked. 'Yes, for a time in the army; that was all I had to drink.' 'And from that time,' he said, 'you have suffered, getting worse and worse as the animal has grown.' Dr. Flower took my case. In a little while he killed the animal and passed it in pieces from the bowels. My troubles began to immediately disappear. It has been nearly six years since Dr. Flower cured me of this awful trouble, and gave me back to my family, a happy man. I believe Dr. Flower is the one great medical wonder of this age."

Mrs. Hiram C. Bond, wife of the large shoe manufacturer of Haverhill, Mass., said: "Six years ago I was most successfully treated and cured by Dr. R. C. Flower, of Boston, of

VERY SERIOUS CANCEROUS TROUBLES,

after treating with the leading physicians of Haverhill and Boston, also the Boston hospitals, and by all pronounced incurable. Dr. Flower is a most wonderful man. How he cures people the way he does, and restores to health the dying I cannot tell, but he does it."

Silas C. Mott, a prominent business man of Provincetown, said: "Four years ago I was in wretched health, could hardly walk across my room, or bear my weight upon my feet for twenty minutes at a time.

BESIDES MY PARALYSIS, MY HEALTH WAS WRECKED.

I could not eat anything without great distress, and had no strength or endurance whatever. My family physician advised me to go and see Dr. R. C. Flower, of Boston, as he regarded him the greatest physician for chronic diseases in the world. As a last resort I went. Well, to be brief, Dr. Flower in a few months worked in me a marvelous cure; I could eat everything, attend to my business as I never did before; to-day I am a happy man. Furthermore," continued Mr. Mott, "Dr. Flower doctored my daughter for a swelled and enlarged knee. She had been under the treatment of other doctors for months, growing worse all the time. I took her to the Massachusetts Hospital in Boston. They advised an operation, saying they could not find out the difficulty without cutting into the knee; this I refused to allow. They then did her knee up in splints; the pressure of the splints made the knee worse, and in this helpless condition I took her to Dr. Flower. He ordered the slipnts taken off, and in a little while cured the knee permanently;" and as the grateful man wiped the tears from his eyes, he said, "We owe all to Dr. Flower."

Mrs. H. P. Hughes, of Provincetown, wife of Capt. H. P. Hughes, an old and prominent family of the Cape, said: "Dr. R. C. Flower treated and cured my husband of a terrible disease, which had followed him since his army days. Being in poor health myself, from female and other diseases (after seeing what he had done for my husband) though given up as incurable by other physicians, I consulted Dr. Flower myself. His examination of my case satisfied me for the first time that I had found a doctor who understood my troubles. I placed myself under Dr. Flower's care, and in a few months was cured, both to my own surprise and the surprise of all who knew me. We have both enjoyed wonderful health since treating with Dr. Flower. As a physician, we regard him a wonder, as a man, a most elegant gentleman."

Mrs. O. Ware, a well-to-do farmer's wife, living three miles from Hudson, Mass., stated that she was treated by Dr. R. C. Flower, a few years ago, for large tumor in the bowels; that it had, shortly before going to the doctor, developed a cancerous phase; that she had been a great sufferer, and was scarcely able to go up and down stairs; that she had doctored for years without any relief; that the last physician, before she consulted Dr. Flower, said that there was no cure for her, and that she would be foolish to try again.

As a last resort she went to see Dr. Flower. He took the case, and in a few months' time

ENTIRELY REMOVED THE TUMOR;

that she has been perfectly well ever since, and can do as much work as any woman; never felt better in her life.

Theodore Harrington, a large manufacturer of Southbridge, Mass., stated that about a year ago, all broken down in health, as a last resort he had consulted Dr. Flower; that for six years previous he had been a sufferer from

CHRONIC RHEUMATISM

and neuralgia, and for the last two years a great sufferer, unable to dress himself, and scarcely able to move; that he had fallen off in flesh to almost a skeleton: that latterly a serious stomach trouble had developed; that he was believed by all to be at his journey's end; that he had been doctored by all the leading physicians around there and given up as incurable; that upon entering Dr. Flower's office, to his surprise, the doctor told him his trouble in detail, without asking a question, better than he could have told the doctor; then he placed himself immediately under the doctor's care, and to his great surprise began to improve rapidly, and that he was now in a vigorous, healthy condition; that he had gained as much as three pounds in one week; that he regarded Dr. Flower as the most wonderful physician in the world.

In fact, there is no limit in the work Dr. Flower does; to the number of sick he cures, and dying he saves. He is an unpretentious man, of between thirty-five and forty years of age, highly educated, easy in his manner, and an entertaining conversationalist. He is intensely interested in his work, and loves his practice as he does his life. It seems to me that Dr. Flower has been raised up by heaven to cure the sick. The wonderful power he possesses in diagnosing disease many believe to be a Divine gift. In the recent completement of his new Health Palace, which is unquestionably the finest on the earth, every kind of treatment is to be found, given in the most gentle, skillful, and scientific manner.

The doctor's charges vary according to the disease and the requirement. I have abundant evidence that he is very considerate to the poor.

The rates I understand, in his health palace for treatment, board, care, and attention, range per month from one hundred and thirty to eight hundred dollars, and this includes every comfort, every attention, and luxury known. The SPECTATOR Publishing Co., of Boston, offer for a few weeks, free of charge, to any one sending a two cent stamp for postage, a new publication descriptive of Dr. Flower, his work and health home. It is a work which should be in the hands of every one.

In his great work Dr. Flower is ably aided by his efficient brother Dr. A. H. Flower, Dr. W. O. Jones, and others, who devote their exclusive time to the services of the sick. In this the most of all philanthropic works, Dr. Flower will have the prayers and good wishes of all.

SWEET CORN, CABBAGES, ONIONS, FRUITS, ETC.

Many of the largest and most successful Truckers and Growers of these crops in New Jersey, Long Island, Pennsylvania, New England and Western States use the MAPES SPECIAL CROP MANURES TO THE EXCLUSION of PURCHASED STABLE MANURE.

Cabbages—Out of 150,000 *cabbage plants not more than* 1,000 *were not out.*

Messrs. VREELAND & CO., the well-known truckers at Greenville, N. Y., report, October 4th, 1888, on second year's experience:

We have been well pleased with the Mapes Vegetable and Cabbage Manures this past season. Our crops have been and are at present fully up to our expectations.

We set out 150,000 cabbage plants.

Early Wakefield 15 inches apart and Flat Dutch 20 inches apart, both in rows two feet apart.

We applied 1,500 to 2,000 lbs. of the Mapes Manure per acre, one half broadcast and harrowed in and the other half hoed in at first hoeing.

Out of the 150,000 Cabbage plants not more than 1,000 were not cut, and there were not more than 1,500 culls out of the entire number (150,000).

We grow Cabbages on same land, year after year.

We used your Manures alone and with stable manure, and we see no reason why your Manure cannot be used entirely as a substitute for stable manure.

We have sixteen acres of Celery that looks remarkably fine, and this was planted after Spinach and Lettuce raised with your Vegetable Manure, no additional Manure used.

We had good success with Early Cauliflower with your Manure.

Bringing up the land—Potatoes, Cauliflowers, etc.

ROBINSON GORDON, Manorville, L. I., (who has bought the Mapes Manures since 1878), September 11th, 1888, reports:

I used 27 bags of your Potato Manure on 3½ acres, on land that never has been considered good enough to raise potatoes, and they had nothing more than ordinary field culture. The Potatoes were of excellent quality and very smooth. Yield of marketable potatoes 1,060 bushels.

From 2½ acres, with 20 bags of your Cabbage and Cauliflower Manure, I sold 470 barrels Cauliflower which netted me just $500, clear of freight and commissions.

I had 33 acres in Potatoes, Corn, Rye, Wheat, Oats, Buckwheat, Peas for seed, Hay, Cauliflower and Vegetables, and I used your Manures (some 15 tons) on all my crops.

I have found by several years' experience that the easiest and cheapest way to bring worn out fields to the best of fertility, and keep good land growing better, is by using Manure like yours. I have used the Mapes Manures exclusively.

Cabbages.—Not more than 100 *in* 8,000 *failed to make Good Heads.—Green Peas:* 389¼ *Bushels per Acre; Extra Prices Obtained.—Green Corn:* 37,500 *Ears Sold from* 2½ *acres; Took First Premium at Monroe County Agricultural Fair.*

R. W. SCHWARZ, Analomink, Monroe Co., Penn., November 17th, 1888, reports:

CABBAGES: With farm and stable manure alone I have too much loss with cabbage from maggots and club root. The past season was favorable for cabbage, and I had the best crop I ever raised. There were not more than 100 out of 8,000 that failed to make good, salable heads. Used 1,600 lbs. of the Mapes Cabbage Manure and 400 lbs. of Bone, harrowed in with Acme harrow. Stable manure, 15 tons, ploughed under.

SWEET CORN: Applied only the Mapes Corn Manure, 1,600 lbs. per acre, around the hill with a fertilizer dropper at time of planting, and again at last cultivation. Yield, 37,500 salable ears on 2½ acres. I had no nubbins whatever. I had 100 hills of the Squantum variety which had from nine to 12 ears per hill. Besides the 37,500 ears sold there were 6,000 or more ears left on the stalks for want of profitable sale.

"TOOK FIRST PREMIUM AT MONROE COUNTY AGRICULTURAL FAIR on almost all my vegetables raised with THE MAPES MANURES, and this with very brisk competition."

Mr. Schwarz reported last year:

This field has had nothing but the Mapes and Bone for the past fifteen years, and has been planted to corn since 1879, excepting years 1884 and '85, when it was planted to general truck.

DAVID KUEHN, Highland Truck Farm, Allentown, Pa., reports:

With your manure our crops are BETTER, and land in BETTER CONDITION than ever, and our crops only cost about ONE-HALF AS MUCH as with purchased stable mauure.

Out of 40,000 cabbages, with 1,500 lbs. per acre of your Cabbage Manure and a light dressing of barnyard manure, at least 97 in every 100 were salable cabbages. I believe your Manures are the cheapest in America.

Architecture.

AN OHIO FARM-HOUSE.

THE fine house shown at Fig. 92, with floor plans at Figs. 93, 94 and 95, is owned by Mr. Geo. Dormire, of Champaign County, Ohio. Mr. Dormire writes as follows concerning it:

"The foundation plan shows that the cellar is excavated under the entire house, and we utilize the entire space. The furnace (a Barstow wood-burner, see Fig. 93) is admirably located and has given us splendid results in heating our house this winter. The cold air is taken from the north side of the house and conducted through a cold-air shaft directly under the furnace. We also have an opening in the floor directly above the furnace, by which we can admit the cold air from the floor down between the two walls that inclose the furnace at the places marked "cold air;" then it passes under the furnace to be heated, and passes up into the rooms above. This I consider a grand feature in heating by a furnace, and I think the lack of it is the chief cause why some furnaces fail to give good results; for I have sometimes found it extremely difficult—in fact, it was almost impossible—to force hot air into the rooms above when they were filled with cold air, but now we can shut off the cold air in the cold shaft, and open the opening (which should be a register the same as for hot air) above the furnace and admit the cold air from the rooms, thereby creating a circulation of air at once. The cold air passing down is heated and then passes up into the rooms, and our house is soon filled throughout with hot air.

The wood is thrown down the trap-door opening at the east end of the house. It is then loaded on a swinging car and conducted directly to the furnace along the line of track shown on the plan. I intend to take our fruit and vegetables down by a hoist at the same opening; then by means of the car all can be taken where wanted for storage.

The fire-place is intended for soap and apple-butter making and other like uses. The sink at the corner is supplied with cold water and conveniently located for all purposes incidental to a fire-place. The sink under the pantry is supplied with both hot and cold water and is very convenient. The entire cellar is well lighted and ventilated, as shown by the windows, which are hung on hinges and swing upwards.

The three chief points considered in the construction of this house were convenience, durability and comfort; but its hygienic and sanitary conditions were by no means overlooked. The first-floor plan, at Figure 94, shows the location of the rooms and gives their respective sizes. The ceilings are 10 feet high in the clear. The plastering is finished with a brown or rough coat, and will be either painted or papered. The hall, parlor and sitting-room are finished in black walnut; the bed-room is finished with wild cherry, and the dining-room with white walnut or butternut, and all wood-work is artistically carved and finished in a respectable manner. All the wood-work inside (except that in the kitchen, pantry and the bed-room over the kitchen) is filled and finished with two coats of the best varnish. The kitchen, pantry and bed-room over the kitchen and the entire outside of the house have three coats of the best lead and oil paint.

The kitchen and dining-room are provided with a double cupboard accessible from either side; and this is quite a convenience, saving much running from either the kitchen or dining-room. The dumb-waiter or elevator cupboard is also arranged so as to be accessible from either the dining-room or pantry. This is one of the most labor-saving arrangements in the house. Whatever there may be in the cellar can be placed on the waiter and elevated for use in the dining-room, pantry or kitchen, thereby saving many trips down and up the cellar stair-way, which is very wearisome, as many housewives can testify.

The hot-water boiler is placed between the kitchen side of the cupboard and the kitchen flue, close by the cook-stove, which heats the water in the boiler by means of pipes introduced into the fire-box of the stove. The kitchen sink is supplied with both hot and cold rain water as well as well water. The pantry is furnished with all the conveniences that are needed in a well arranged pantry and they are shown at Fig. 94. The work-table has six drawers underneath. The swinging shelf above and rather to one side of it, is provided with small shelves for spices and other such condiments. The shelves over the meal-chest are larger and extend to the ceiling. The cupboard is amply large and convenient. The pot cupboard is convenient for concealing pots, skillets, etc., that housewives do not wish to have exposed when they are not in use.

The kitchen stairway is very convenient, either for going upstairs the back way, or down to the cellar. The wood-house adjoins the kitchen, and there is no need of going out from the hot kitchen into the cold storm or during inclement weather at the risk of health and life, to an outside wood-shed for fuel, for the wood is as close as it can be to the kitchen, and there is no exposure or a long trip to get it. The wash-house is also conveniently located to the wood-house and kitchen, and arrangements have been made to have it supplied with all the necessary equipments when it is to be used for purposes for which it was intended. At present it is used for a living-room. Both the front and rear porches are supplied with sinks. All of the rooms on the first floor are supplied with ventilators both near the floor and near the ceiling, for controlling the temperature, and all of the rooms throughout the house are provided with proper openings in the floors for the admittance of stove-pipes, to be used in case the furnace should be disabled by some accident. Stoves will be used here only in case of such an emergency.

All of the rooms on the second floor—see Fig. 95—except the bath-room are bed-rooms, and all are accessible from the hall above. Each room is finished in a different kind of wood, and all bed-rooms, except one, are supplied with wardrobes built in the walls. The space under the attic stairs is a receptacle for bed-clothes. The bath-room has a bath-tub, wash-stand and water-closet. The bath-tub and wash-stand are supplied with both hot and cold rain water, which we think is more desirable than well water. The water is heated by the boiler in the kitchen. All of the rooms on the second floor are warmed by the furnace. The locations of the registers are shown in the plan. The balcony is accessible from one of the hall windows. Its railing and the upper deck of the roof will have suitable cresting, which will give the house a more complete appearance. The water is supplied from tanks in the water-house located a short distance east of the dwelling-house. The rain water runs directly into a tank from the water-house roof and furnishes all the rain water that we need without any pumping or much further attention. The well water is pumped into a tank on the same level with and by the side of the rain water tank. From there the water is distributed wherever it is needed by means of pipes. The water is pumped by a Haladay wind-engine (13 feet). The same power does churning and washing, saws the wood and grinds the feed. It has given us grand results, and at present is undergoing some changes. When these are completed it will give us still better satisfaction.

This house is not quite completed. It will cost not far from $4,500 when done. The cost may vary, depending upon the price of lumber and labor. The lawn is not laid out, and I want advice from those who have had experience in landscape gardening. It will be useful to have others tell me what trees, shrubs and vines to procure, and how to arrange them so as to produce a good effect. We have, or think we have, a substantial and handsome house, and now we want the grounds to help it out.

AN OHIO FARM HOUSE. Fig. 92. From a Photograph.

THE R. N.-Y. in mentioning lines of work in which the various experiment stations could interest and instruct farmers, has frequently urged the stations to prepare plans of good barns and other farm buildings.

It is very gratifying to see that some of the stations are acting upon these suggestions and presenting excellent plans for barns, silos, piggeries and other useful structures. The stations at Cornell and at Madison, Wisconsin, lead in this work, and we think the plans they have submitted will be found useful by farmers. The West Virginia Station has issued a pamphlet on creameries that gives detailed plans and specifications. This is a most commendable enterprise.

WOMEN'S NATIONAL POTATO CONTEST

Names of Contestants.

EVERY STATE REPRESENTED.

The following list comprises the names of the women who have entered as contestants in the Potato Contest. It will be seen that about every part of the country is represented.

Arkansas.

Mrs. Bethene Simpson, Jefferson County.

Arizona.

Mrs. W. A. Lattin, Pinal County.

California.

Mrs. M. M. Sornborger, Shasta County.
Mrs. Jno. E. Askew, El Dorado County.
Catharine Alter, Lake County.
Elly Alter, Lake County.
Miss Eva Chapman, Lassen County.
Mrs. Nancy Peck, Sonoma County.

Connecticut.

Mrs. Mary E. Warren, Fairfield County.
Ella Barnum Weeks, Fairfield County.
Mrs. Wilber C. Jennings, Fairfield County.
Miss Lucy M. Woodruff, Hartford County.
Mrs. Cornelius Colt, Litchfield County.
Mrs. Julia Andrus, Litchfield County.
Mrs. M. E. Saunders, Litchfield County.
Ada Starr, New London County.
Rush C. Bill, New London County.
Grace D. Bill, New London County.
Mrs. D. A. Starr, New London County.
Mrs. Ada B. Tracy, New London County.
Mabel A. Tracy, New London County.
Mrs. A. B. Anderson, New London County.
Minnie C. Hotchkiss, New Haven County.
Mrs. Geo. W. Drew, New Haven County.
Mrs. J. D. Walter, New Haven County.
Mrs. Wm. P. Andrews, Windham County.
Mrs. Lemuel Wibberley, Windham County.
Miss Maud Cruff, Windham County.
Mrs. J. A. Cruff, Windham County.
Mrs. M. V. Douglas, Hartford County.
Mrs. J. H. Vallett, New London County.
Annie M. Champlin, New London County.

Colorado.

Mrs. William L. Kirk, Fremont County.
Mrs. W. J. Paddock, Lake County.
Mary S. Watson, Bent County.
Mrs. Hepsy Hamilton, Pitkin County.
Ines and Winfred Hammond, Delta County.
Mrs. P. A. Leonard, Conejos County.
Mrs. C. L. Hepburn, Park County.
Mrs. Oliver Howard, Weld County.
Mrs. Harris Stratton, Larimer County.
Eliza C. Horner, Larimer County.
Mrs. D. F. Griffith, La Plata County.
Mrs. J. C. Tunnell, Weld County.
Mrs. Miriam M. Gravestock, Montrose County.
Mrs. Mary McClave, Pueblo County.

Dakota.

Mrs. Helen Wheeler, Jerauld County.
Emma Ladbury, Griggs County.
Mrs. Mary L. Fuller, Beadle County.
Mrs. R. W. Harrold, Cass County.
Mrs. J. E. Haven, Morton County.
Mrs. Wm. C. Port, Grant County.
Mrs. Antoinette C. Warner, Sanborn County.
Miss C. L. Thomson, Cavalier County.
Mrs. Jno. X. Wilson, Foster County.
Mary McKenzie, Lawrence County.
Mrs. W. A. Keep, Aurora County.
Mrs. M. M. Cable, Lincoln County.
Mrs. G. H. Ingersoll, Miner County.
Mrs. W. A. Bishop, Beadle County.

Delaware.

Mrs. J. K. Haldeman, Kent County.

Idaho.

Mrs. John Grimes, Nez Perces County.
Mrs. Eliza Robb, Boise County.

Indian Territory.

Mrs. J. A. Foreman, Cherokee N.

Iowa.

Mrs. J. N. Munsey, Buchanan County.
M. J. Auten, Cedar County.
Mrs. Sarah E. Taylor, Winnebago County.
Mrs. Maria Watts, Henry County.
Miss Bird Moon, Mitchell County.
Mrs. C. E. Dingman, Jasper County.
Mrs. L. G. Steven, Cerro Gordo County.
Mary Wharton, Iowa County.
Mrs. Emily A. Pitt, Allamakee County.
Adelie J. N. Peet, Marshall County.
E. Fay Welsch, Cass County.
Mrs. J. S. McChesney, Louisa County.
Mrs. M. A. Gager, Howard County.
Mrs. D. K. Goodrich, Fayette County.
Mrs. Betsey Watson, Buchanan County.
Mary Rusk, Madison County.
Mrs. Sarah Hawley, Marshall County.
Minnie A. Gunn, Putnam County.
Lelia L. Beighle, Ford County.
Mary J. Grundy, Christian County.
Tina Pharr, Wayne County.
Mrs. Maurice Barnes, Boone County.

I BUILT a fire-place in one corner of one room of my new house and find it more out of the way than anywhere else; also the chimney was not in the way of our central end window in the half story above. The chimney draws well, but the house is so tight that if a little air is not given at a transom or window when building a fire, it smokes somewhat. Opening either threw a cold draft across the room. So I took up the hearth, broke a hole in the brick wall which encircled it and held the dirt and sand on which the hearth was laid, pushed a six-inch-stove pipe through under the house, and by joining another joint to it, and laying the second joint in the sand under the hearth brick, I had a draft from under the house coming up freely under the forestick in the fire. I should say that a short elbow turns it upward under the forestick. When all doors are shut, this draft is very strong and one can start a fire on a cold morning very quickly and make a very hot fire in a much shorter time than without it. I can use green wood, or with dry wood I can glaze the brick lining the fire-place if I let all the draft on. I keep an old stove hearth over the opening, and raise the inner edge with a bat

Mattsville, Ind. E. H. C.

MAKING EGG PLANTS "LAY."

P. B. C., Catonsville, Md.—Won't some one give me an egg-plant special—just a piece of a column? I would like to have the inside facts about how to make them lay. Are commercial fertilizers good? If so, how much and what kind? This year mine made a luxuriant growth of foliage and bore but very little fruit. What was the probable cause? Is it best to save one's own seed? What is the best variety for market? How close ought they to be planted?"

ANSWERED BY WILLIAM FALCONER.

Sometimes I have had an excellent show for an early crop of fruit; but somehow or other the fruit failed to set and swell. The plants would look thrifty and have lots of blossoms in June, but they wouldn't begin to set fruit till July. I have blamed the rain and chilly nights for interfering with the fertilization of the flowers, and, too, I have blamed myself for not keeping a few hives of honey-bees to assist me in [setting [the fruits and seeds of my trees, flowers and vegetables. I attach a good deal of importance to this honey-bee question and am satisfied that bees mean fruit if the climatic conditions are at all favorable. New York Improved is the favorite variety, Black Pekin is also much grown, and I also raise some Early Long Purple for early. The last-named is quite prolific, dwarfer and bushier than the New York and some days earlier, and while good enough in its way for home use, it has neither size nor good appearance enough to commend it as a market variety. The White and Striped are also edible, but not worth growing for this purpose; they are good enough to grow to make up a number of varieties for exhibition purposes; but for no other use that I know of. They are recommended as decorative plants, but I have always considered them very far-fetched garden ornaments. For egg plants to come in about the end of June, I sow them in a hot-house in February, and prick off and pot the seedlings as their growth demands it, till by the first of May they are in eight or nine-inch pots. During all this time they are grown in a temperature of not less than 70 degrees at night; if it runs up to 90 degrees by day it's all right. Now, from the 20th of April till the end of May, is the most critical period in the life of these egg plants; the bright, warm days are apt to induce us to expose our plants too much, with the idea that it is good for the plants, also with the notion of hardening them off; but this is a mistake. Keep them hot at all times, close except during the forenoon warm sunshiny blinks, and especially warm at night, no matter how hot the weather may be. And when they come into bloom—about the first of May—fertilize them artificially, that is, with a camel's-hair brush in the forenoon, and don't plant them out till the first of June, and then only if they are well set with fruit, well inured to the weather for a week or two previous, and in warm sunny ground. If they are planted out when in bloom but not set with fruit, the flowers will be likely to drop off without setting fruit. For my main crop I sow in a hot-house about the end of March and grow on in pots in warm quarters till towards the end of May when I harden them off gradually and plant them out at the end of May or early in June. Had I to raise them in hot-beds I would not sow them before the middle of April, and then in a fresh, brisk bed. We often make sad mistakes with hot-beds. A hot-bed that is fresh and brisk about the first of April is apt to be cold enough before the end of the month, and as egg plants cannot bear cold, it is far better to delay sowing till the middle of the month and then between manure heat and sun heat drive the plants without any check from first to last. Hot-beds in March are hard to manage; the weather is cold, often dull, and the beds need a deal of covering, and as we have to keep them close so long, the seedlings often drop off or come up spindling. Our main-crop plants usually give us fruit about the 10th of July, and about the 20th of the month are in pretty good bearing. We don't wait till the fruit is as big as a pumpkin before we use it. We begin cutting when the Long Purple is about the size of a Bartlett pear or the New York about as big as an Alexander apple. We like rich, loamy, well drained land, and a sheltered but sunny exposure. We plant in rows three feet apart and 2½ feet asunder in the row. We use barn-yard manure only. Last year the cold, wet May left the ground in poor condition for tropical plants till well into June, and the heat and drought of June had hardly established the plants when cold, wet weather set in in July, and although egg plants grew well after midsummer they did not fruit as early or as freely as they generally do. Egg plant seed is quite cheap, and I always have had as good success with bought seed as with what I have saved myself.

ALL ABOUT WILLOW CULTURE.

Several Subscribers.—Will somebody who has had long experience in the business tell us how to grow, cure and sell basket willows?

ANSWERED BY H. W. HORN.

The kind of land best adapted is such that it will retain moisture throughout the summer, but will not be too wet. Land that has surface water, such as springy ground, is not well adapted for a good growth of willows, as it is too cold. If, on the other hand, the soil gets very dry during the growing season such as some of our tamarack swamps here in Western New York, it isn't at all adapted for successful willow culture. Very good crops of willows are raised on what is called creek and river bottom land, but in nearly all such cases, the willows must be cut in the fall as the floods would do much damage. For culture, plow the land in the spring, (or, better still, in early fall,) and give it a thorough harrowing and roll if you can, then take a stout line the length of the land to be planted, and draw it tight, fasten a sharp stick to each end to hold it, and you are ready for planting. Have the cuttings about 10 inches long. They should be from two or three-year-old willows. Be careful to have the right side down; and stick them close to the line at least two-thirds of their length in the ground and about 10 inches apart in the row, the rows being two feet and nine inches apart. If the rows are further apart the willows will be very apt to grow crooked from the buts. Cultivate thoroughly the first and second seasons, to keep the weeds down. Thereafter the willows will do that. As regards the proper time for cutting, unless the willows are to be peeled in the sap, they should be cut in the fall as soon as all the leaves are down. They are then steamed, a process which is simple and easily learned—and peeled with a small hand-peeler and also by a machine. Regarding the latter, to my knowledge none has yet been invented that gives perfect satisfaction, as those now used are very apt to split the willows. Here is another point in favor of fall cutting: if a willow plantation is so located that the snow will be badly drifted in it much damage will be done; but this, of course, is not the case in the Southern States. To peel the willows in the sap, they are tied in bunches of about 40 pounds each. The lower band should be about six to eight inches from the buts. Set them in a shallow pond of water about two inches deep. For that purpose the buts must be quite even. Then as soon as each row of bundles is set in, with a knife cut the upper band off. The following point is a very important one the neglecting of which, years ago, caused myself and others serious losses. When the willows are put in the water, a pole or rail should be fastened between at least every third row of bundles to prevent high winds from blowing them over to one side; for if that once happens and you should not get near them for some time the consequence would be disastrous. The poles should be three to four feet above the water. As to peeling: just as soon as the buds are fairly open and the leaves show, then peeling begins. The willows are then dried by spreading them out in the open air bound in bundles of about 50 pounds. The binding is all done with green willows, and my mode of packing them so that they will stand much handling and arrive at their destination in good order is something that I can show better than I can describe. In regard to selling, there are markets for them in nearly all of the large cities east of the Mississippi river. I ship mine to Buffalo and New York City. At present the prices are so low that I have almost quit that business, and am now in the black raspberry line. Last summer I sold my sap-peeled willows for five cents per pound. My crop of last fall I steam-peeled and sold recently for four cents per pound. Green, they are worth here at present about $14.00 per ton, and it takes about 2½ tons or over of green to make one ton of peeled willows, a fact which is generally ignored by those who write on the subject of willow culture. The yield will be according to the quality of soil, and may be anywhere from three to six tons per acre. The first season's growth is good only for nurserymen's use. Cut back to the old stock and as close as possible every time.

REMEDIES FOR BLIGHT ON FRUIT TREES.

J. W. H., Cleveland, Ohio.—1. I read in some of the agricultural papers last fall, of a wash for pear trees, to be used for the prevention of blight, consisting of two ounces of carbolic acid, 10 pounds of sulphur, and one peck of lime. I went to an experienced druggist to get the sulphur and carbolic acid. He said more of the efficient constituent of sulphur was contained in roll sulphur, and that I ought to take that, and not the flour of sulphur, but I could not make that so fine that it would not clog the sprayer. He also said that I ought to take the refined carbolic acid; but that is much more expensive than the crude. It is strange that men who write or speak of such recipes do not speak more definitely. Should I use the flour of sulphur and the crude carbolic acid? 2. I lost a number of pear trees last year; was the disease blight? When I first discovered it blood-like watery drops were running down the limbs, and on cutting into the bark I discovered that the inner bark had many small reddish streaks through it. On some of the trees the leaves died and the limbs shriveled, but at the same time, several feet down the limbs where there was no external appearance of anything being wrong, I found these reddish streaks in the bark, and the inner layer of the bark next the wood had a reddish tinge and in some cases while the top was beginning to be affected I would find the bark partly down the tree not affected, or but little, while down the trunk of the tree the bark was already dead or nearly so.

ANS.—1. The druggist may be correct in

stating that roll sulphur (brimstone) contains a larger percentage of the needful elements for the purpose intended, but, on account of the difficulty of pulverization of the roll and because the flour is in condition for immediate use, flour of sulphur, (more commonly called "flowers of sulphur,") is universally employed for such purposes. We are not prepared to say that refined carbolic acid would or would not be more effective for the purpose intended; the fact is, however, that the crude acid is always used and recommended by careful experimenters for this purpose. 2. The description of the disease of the pear trees is scarcely full enough to warrant a definite conclusion respecting its cause; although it seems to be, probably, a serious case of blight. The date of its occurrence is important, since blight only attacks the pear during rapid growth, and in warm weather. The injury always extends considerably below the outward indications of the disease, which may account for the discoloration of the inner bark and the wood as described.

SUB-EARTH VENTILATION.

O. S. H., West Deer Park, N. Y.—In the R. N.-Y. March 2, report of the Western New York Horticultural Society mention is made of "a system of sub-earth ventilation by which the temperature in a hill-side cellar or storage room may be kept uniformly at 45 degrees. What is the method of getting the ventilation and cooling the air. Is it by passing the air through a covered ditch or pipe? If so, how large, how long and how deep must it be buried to cool 500 cubic feet of air; or in what other way is it done?

ANS.—The cold-storage system was described by Mr. E. A. Bronson of Ontario county, N. Y. The house is on a brow of a hill, but almost all on the surface. The bottom is cemented; the roof and walls are double with six inches of sawdust in the interspace. Air is admitted only by means of tiles put together with water-lime in the bottom of a ditch 100 feet long covered to the surface. This gives all the ventilation. Prof. Cook (Michigan Agricultural College) uses such a structure for bees; he writes us as follows concerning it. "I have used sub-earth ventilation for bees for several years. My room or cellar is wholly under ground, and well protected against the outside temperature. The floor above is double, with a foot of dead-air space. The chimney runs from the bottom of the cellar to the top of a two story building, which stands on an exposed hill. Of course, a fire in the rooms above heats the chimney and tends to draw the air from the cellar. The wind passing over the chimney I find does the same thing. Thus on windy days I find there is a strong current of air from the cellar into the opening at the bottom of the chimney. The sub-earth pipe from my cellar runs from five to eight feet under ground, for a distance of about eight rods when it opens to the surface. This pipe is of glazed tile four inches in diameter. Then a three-inch tile runs as much further. If I desire, I can stop the opening at the end of the four-inch tile, and thus have the air come from the longer distance. I have known such ventilation to keep the temperature of a bee cellar in our coldest winters from 40 degrees F. to 50 degrees F. from November 1st to April 15th. Yet there were from 20 to 80 colonies of bees in the cellar. I doubt if such ventilation will suffice to keep a room cool enough in warm weather to preserve fruit. It might, however, aid in doing this. I think that it will, if properly arranged, keep a bee cellar from 38 degrees F. to 48 degrees F. from October to April. And this may be made to preserve the proper temperature to keep our bees quiet during the trying times in our severe Northern winters."

CROPS FOR SEEDING TO GRASS IN WIRE-WORM INFESTED CLAY LAND.

E. S., Allegany, N. Y.—A 20-acre lot of clay ground which had been in grass for five years, was broken last fall. I want to put in a crop and seed it again. I cannot sow oats as the wire-worms would destroy them. Would it be well to sow barley—a new crop with me?

ANS.—Our friend's knowledge of the fact that his land was infested with wire-worms, should have deterred him from plowing his land in the fall, with the intention of planting it to any grain crop the following spring. It would have been better in such a case to have deferred plowing as late in the spring as would have given barely time for a seasonable planting of the crop; the conditions then would have been such that the green rootlets of the inverted turf would have afforded food for the troublesome pests, while the young grain plants were entering upon their first stage of growth comparatively unmolested; whereas, owing to their decomposed condition—the result of plowing in the fall—the voracious little pests will "go for" the more expensive diet with increased avidity. To grow barley successfully, it is essential that the ground be rich in the elements of plant food; warm and dry naturally, or made so by artificial drainage, so that the seed may be sown as early in the season as possible, conditions, it is feared, our friend's 20-acre field does not possess, on account of its tenacious clay soil, and impoverished condition after being devoted five successive years to hay production. It is not therefore deemed advisable to sow it to barley. Perhaps no crop is less likely to be injured by the wire-worm than the bean, and it is often grown with a good degree of success where the pests prevail, and if other conditions favor in the locality, would it not be well to plant a portion of the field to this crop? And as the quality of the soil seems better adapted to the production of oats than to the crop in question, it is also probable that if the remainder of the field were sown to this grain, as early in the season as practicable, fertilized with 150 or 200 pounds of standard superphosphate per acre, the results would be attended with some degree of profit.

ALKALI SALTS FOR FERTILIZING.

F. B. T., Wallula, Washington.—Is alkali of the same nature as ashes? Has it any fertilizing value? What is the best way to use it where manure is scarce?

ANSWERED BY PROFESSOR E. W. HILGARD.

The mixture of salts designated as "alkali" in the regions of deficient rainfall is quite variable in its composition, but has most commonly as its chief ingredients, common salt or sodium chloride, Glauber's salt or sodium sulphate, and more or less carbonate of soda. When the latter is largely present the alkali is popularly designated as "black," because of the dark tint of the water standing in mud puddles and the black rings left therein after evaporation; it is highly injurious to vegetation and to the tilling qualities of the soils afflicted with it. None of the three substances mentioned above can properly be accounted a fertilizer, although salt is used to some extent in certain cases. But we frequently find as subordinate ingredients of "alkali," salts of potash, also phosphates and nitrates, which are the very essence of fertility and which we pay for in commercial fertilizers. In such cases the use of the alkali salts would be a benefit in any region of abundant rains, where the sodium salts would be again washed out of the soil. But in the Palouse country and in Eastern Washington generally, alkali salts are usually as abundant in the natural soil as they can be without injury, and in a great many cases, especially in heavy soils, their removal is the first condition of profitable culture. On general principles then, and without knowing the exact character of the alkali to which the Wallula correspondent alludes, I should not advise him to expend any money in putting these salts on his lands, if they are at all heavy in character. If of the light silty kind, prevalent on the plateau lands of the Walla Walla, Palouse and Snake rivers, a small-scale experiment would be well worth trying. The Washington State Experiment station should furnish him with information on the composition of the particular alkali in which he is interested.

NERVOUS DISORDER AND NORMAL PULSE AND TEMPERATURE OF A HORSE.

T. F. B., Wolf's Store, Pa.—Four weeks ago I drove my 11-year-old horse about five miles; but he wasn't warm. While driving I noticed that he jerked his head up a few times, and in the stable he did the same, as if something had bitten him on the nose. Two days later I drove him 15 rods and he began to do it again. After being driven 100 rods, he jerked his head again so much that I had to stop him on the road, unhitch and lead him home. When eating moistened hay waste or drinking or running loose he jerks his head towards the right shoulder; when he is resting I can notice nothing except that his ears droop more than usual. His pulse is 35 and is sometimes irregular. 2. What are the regular pulse and temperature of a horse? 3. What is the best way to remove proud flesh from a wound?

ANS.—1. The symptoms indicate some slight nervous disorder which may or may not be due to heart disease. Try the following treatment:—For twelve hours feed bran mashes only; then give in a ball or as a drench in one pint of water, six drams of the best aloes. Continue the mash diet until the animal has been freely purged. If the bowels are not moved by the aloes in 36 hours repeat the dose. Morning and evening as a powder on the feed give two drams of potassium bromide. A laxative diet should be continued for some time—as roots or mashes until you can give an occasional run on grass. 2. The normal pulse of the horse when at rest is about 40; but it may vary from 35 to 50. When exercised it may be considerably higher. The normal temperature is 99 degrees to 100 degrees. 3. A stick of nitrate of silver is one of the safest and best caustics for this purpose.

CORN FOR SOILING.

Several Subscribers.—Will some of the RURAL'S dairymen readers tell us what crops they sow to supply their cows with green food, during the summer, while the pastures are dry and useless?

ANSWERED BY W. B. PRATT, STEUBEN COUNTY, N. Y.

I sow sweet corn if I have it, otherwise the common yellow field corn, in three feet apart drill marks, at a rate not exceeding a half bushel per acre, on strong, well manured land, in close proximity to a field to which the cows will have access during the dry season. Usually I sow twice—once quite early even before planting field corn, and again two or three weeks later. The cultivator is freely used during the season of growth and some hand weeding and hoeing are done if the land is foul. I sow so much ground that if drought sets in early I feel free to draw on the crop before it reaches its best. If, on the contrary, pasture keeps reasonably fresh and abundant, and there is likely to be an excess of the fodder corn, the second sowing is resorted to as soon as it has reached fair maturity, and the unfed part of the earlier crop is cut and cured for winter forage while the weather is yet warm and dry. A liberal feed is dealt out to the cows each morning after milking, by throwing it over a separating fence immediately adjoining, or from a single horse wagon loaded up the preceding evening if found convenient. Light seeding, rich land and thorough cultivation give greatest bulk and weight, and the best feeding results are gained after the glazing stage is reached. With the occurrence of severe autumnal frosts a full feeding of pumpkins each morning is esteemed of much value.

INSECTICIDES.

W. P. C., Smyrna, Del.—1. How much Bordeaux Mixture would be necessary for spraying an acre of grape-vines? 2. How much Paris-green solution would be needed for spraying, for slugs, an acre of pear trees, and how strong should it be? Would either the mixture or solution be injurious to the fruits to which they are respectively applied?

ANSWERED BY PROF. A. J. COOK.

Two or three pounds of the mixture should be used to one barrel—31 gallons—of water, and this will spray one or two acres of vines. For spraying apples, pears, plums, etc., it is best to use one pound of London-purple to 200 gallons of water; then the work can be made very thorough with no injury to the foliage. A good strong force pump, and thorough work are required to save all the fruit. With a tree covered with leaves it stands to reason that some care is required to reach each and every apple or pear. If we estimate two gallons of the liquid to each tree, one pound of the poison will suffice for 100 trees. With a hand pump like the Whitman or Lewis, I have treated a large tree very thoroughly with two gallons of liquid. It might take a litile more with a large force-pump like the Field. The fruit is not injured by its use at the proper time—just after the blossoms fall.

RANCID BUTTER.

S. C. J., Belle Plaine, Kansas.—Can you give me a recipe for restoring rancid butter? I intend going into the produce business soon and want some process of working our butter, as all butter is so poorly made here that I can find no market for it. I know there must be some process as a party in another section is making a regular business of doing it.

ANSWERED BY T. D. CURTIS.

Within the last 15 years, several persons have announced methods for removing the rancidity from stale butter. The first I think, was Mr. H. O. Freeman, of Sherburne, N. Y., who had a process for purifying stale butter by mixing it with skimmed milk in the place of the original butter fat. Before he died, he acknowledged to me personally that the process was a failure. The flavor was lacking, and the oil did not mix well. Others have since tried the same or a similar process, but have met with but indifferent success, at the best. Emulsifiers have been invented for mixing this kind of grease and others with milk for cheese-making, with not altogether satisfactory results, but I have neither seen nor heard of any successful method of restoring rancid butter so as to make it fit for table use. The chemist can neutralize the rancidity, but the flavor of the butter is gone, and only an unpalatable grease remains. So far as my knowledge extends, those who dabble in this kind of business sooner or later "get left." There is no satisfactory process for restoring rancid butter any more than there is for rejuvenating old men. But there are many humbugs and devices afloat for turning a dishonest penny.

GROWING LUCERNE, ETC.

T. C. K., Huntingdon, Pa.—I have about seven acres of two year's mowing ground on which there is about half enough Red clover and Timothy; would it be advisable to sow Lucerne and harrow lightly—how much seed would be needed?

ANS.—Lucerne cannot be grown in the way suggested. It requires the most careful culture and the cleanest land. Its early growth is slow and it is easily overpowered by weeds. On this account its growth in drills with clean cultivation until it occupies the ground is frequently advocated and is certainly desirable under all circumstances. Moreover, Lucerne does not thrive in Pennsylvania as well as clover does, being more suitable to a hot, dry climate and rich soil. A common method in your locality under the circumstances, is to plow under such a sod on which the clover will disappear next year, being now run out, then take a crop of corn, following it with oats the next year, and reseed with Timothy and clover with the oats. But to do this effectively the land should be manured for the sake of the clover and grass.

Miscellaneous.

J. C. D., Old Church, Va.—You can obtain the bee hive from A. I. Root, Medina, Ohio.

E. H. V., Paris, Ontario, Canada.—The following books will serve your purpose. "Agriculture" by F. H. Storer published by Charles Scribner's Sons, New York; Farmer's Veterinary Adviser, Professor James Law, Ithaca, N. Y.; Shepherd's Manual, by Henry Stewart, and Stock Breeding by Professor Manly Miles, furnished by the Orange Judd Co., New York.

Subscriber, Elva, Va.—A has a cow; B takes her to board and care for; feeds her bran or meal twice a day, returns to A the milk at each milking; what ought B's remuneration to be?

ANS.—We would not do this for less than the regular retail price of the milk so delivered.

R. A. K., Greenfield, Ind.—1. Are the onion maggot and the cabbage maggot the same? 2. If not, what will prevent damage from the onion maggot?

ANS.—1. No. 2. The only practical remedy we know of was given on page 333 of the last volume of the RURAL. Coop a hen and chickens on each acre of the field immediately after the young plants appear.

F. S., Berrien Springs, Mich.—Which are the five most profitable pears for this section of Southwestern Michigan? Soil a sandy loam well drained.

ANS.—Assuming that only autumn varieties are to be planted, select Sterling for the beginning of September, Clapp's Favorite for the middle of the month, and Bartlett for the middle to the end; Howell for October, and Anjou for November. For any and all varieties of pears the soil should contain at least some admixture of clay; although most varieties are fairly successful on lighter soils if kept well manured.

M. J. L., Lowell, Mass.—1. Last summer I collected decayed peaches from the dealers and saved the pits. Now I am told by some that I should have pits from natural or wild fruit; will the latter produce more hardy trees? If so, where can I get them? 2. What is the best length for currant cuttings to give the best results; also how deep should they be set in the ground?

ANS.—We should prefer the natural fruit for seed because the seedlings would be less liable to inherit the weaknesses or diseases of their parents and would therefore serve better as stocks. Inquire of J. H. Hale, South Glastonbury, Conn., as to where the pits can be obtained. 2. We use cuttings about six inches long. Whether this is the most advantageous length or not we cannot say. We set them in the ground as deep as the cutting, allowing only the top eye to peep out.

B., Floral Green, Ohio.—1. Why won't geraniums grow under the shade of a tree planted in the ground, when they *will* grow on a veranda, or a shaded place if planted in pots? 2. Is it better to plant geraniums in the open ground, in the bed, or to set them in the bed in pots? 3. Would a general collection of plants keep in a cellar where they would have plenty of light, but very little sunshine, with a low temperature most of the time? 4. My canary bird is about a year old. He is healthy, sings very well, but he will bite on the wires of his cage, hold his beak on the wires and pull like a wind-sucking horse.

I feed him mixed canary seed, apples and bread. What should be done for him?

ANS.—1. The roots of the trees ramify in every direction and appropriate most of the soil's moisture. 2. It is better to plant the geraniums in the soil of the beds. 3. Many of the hardier plants would keep well under such conditions, such, for instance, as pelargoniums, (geraniums), tender roses, aloes, rubber plant, oleander, etc, etc. 4. We should feed the bird for at least a month canary seed *alone*.

DISCUSSION.

A GENUINE LABOR-SAVING IMPLEMENT.
